QUESTIONS 405

LOGIC

CHAPTER I

INTRODUCTORY

Sec. 1. Logic is the science that explains what conditions must be fulfilled in order that a proposition may be proved, if it admits of proof. Not, indeed, every such proposition; for as to those that declare the equality or inequality of numbers or other magnitudes, to explain the conditions of their proof belongs to Mathematics: they are said to be _quantitative_. But as to all other propositions, called _qualitative_, like most of those that we meet with in conversation, in literature, in politics, and even in sciences so far as they are not treated mathematically (say, Botany and Psychology); propositions that merely tell us that something happens (as that _salt dissolves in water_), or that something has a certain property (as that _ice is cold_): as to these, it belongs to Logic to show how we may judge whether they are true, or false, or doubtful. When propositions are expressed with the universality and definiteness that belong to scientific statements, they are called laws; and laws, so far as they are not laws of quantity, are tested by the principles of Logic, if they at all admit of proof.

But it is plain that the process of proving cannot go on for ever; something must be taken for granted; and this is usually considered to be the case (1) with particular facts that can only be perceived and observed, and (2) with those highest laws that are called 'axioms' or 'first principles,' of which we can only say that we know of no exceptions to them, that we cannot help believing them, and that they are indispensable to science and to consistent thought. Logic, then, may be briefly defined as the science of proof with respect to _qualitative_ laws and propositions, except those that are axiomatic.

Sec. 2. Proof may be of different degrees or stages of completeness. Absolute proof would require that a proposition should be shown to agree with all experience and with the systematic explanation of experience, to be a necessary part of an all-embracing and self-consistent philosophy or theory of the universe; but as no one hitherto has been able to frame such a philosophy, we must at present put up with something less than absolute proof. Logic, assuming certain principles to be true of experience, or at least to be conditions of consistent discourse, distinguishes the kinds of propositions that can be shown to agree with these principles, and explains by what means the agreement can best be exhibited. Such principles are those of Contradiction (chap. vi.), the Syllogism (chap. ix.), Causation (chap. xiv.), and Probabilities (chap. xx.). To bring a proposition or an argument under them, or to show that it agrees with them, is logical proof.

The extent to which proof is requisite, again, depends upon the present purpose: if our aim be general truth for its own sake, a systematic investigation is necessary; but if our object be merely to remove some occasional doubt that has occurred to ourselves or to others, it may be enough to appeal to any evidence that is admitted or not questioned. Thus, if a man doubts that _some acids are compounds of oxygen_, but grants that _some compounds of oxygen are acids_, he may agree to the former proposition when you point out that it has the same meaning as the latter, differing from it only in the order of the words. This is called proof by immediate inference.

Again, suppose that a man holds in his hand a piece of yellow metal, which he asserts to be copper, and that we doubt this, perhaps suggesting that it is really gold. Then he may propose to dip it in vinegar; whilst we agree that, if it then turns green, it is copper and not gold. On trying this experiment the metal does turn green; so that we may put his argument in this way:--

Whatever yellow metal turns green in vinegar is copper; This yellow metal turns green in vinegar; Therefore, this yellow metal is copper.

Such an argument is called proof by mediate inference; because one cannot see directly that the yellow metal is copper; but it is admitted that any yellow metal is copper that turns green in vinegar, and we are shown that this yellow metal has that property.

Now, however, it may occur to us, that the liquid in which the metal was dipped was not vinegar, or not pure vinegar, and that the greenness was due to the impurity. Our friend must thereupon show by some means that the vinegar was pure; and then his argument will be that, since nothing but the vinegar came in contact with the metal, the greenness was due to the vinegar; or, in other words, that contact with that vinegar was the cause of the metal turning green.

Still, on second thoughts, we may suspect that we had formerly conceded too much; we may reflect that, although it had often been shown that copper turned green in vinegar, whilst gold did not, yet the same might not always happen. May it not be, we might ask, that just at this moment, and perhaps always for the future gold turns, and will turn green in vinegar, whilst copper does not and never will again? He will probably reply that this is to doubt the uniformity of causation: he may hope that we are not serious: he may point out to us that in every action of our life we take such uniformity for granted. But he will be obliged to admit that, whatever he may say to induce us to assent to the principle of Nature's uniformity, his arguments will not amount to logical proof, because

every argument in some way assumes that principle. He has come, in fact, to the limits of Logic. Just as Euclid does not try to prove that 'two magnitudes equal to the same third are equal to one another,' so the Logician (as such) does not attempt to prove the uniformity of causation and the other principles of his science.

Even when our purpose is to ascertain some general truth, the results of systematic inquiry may have various degrees of certainty. If Logic were confined to strict demonstration, it would cover a narrow field. The greater part of our conclusions can only be more or less probable. It may, indeed, be maintained, not unreasonably, that no judgments concerning matters of fact can be more than probable. Some say that all scientific results should be considered as giving the average of cases, from which deviations are to be expected. Many matters can only be treated statistically and by the methods of Probability. Our ordinary beliefs are adopted without any methodical examination. But it is the aim, and it is characteristic, of a rational mind to distinguish degrees of certainty, and to hold each judgment with the degree of confidence that it deserves, considering the evidence for and against it. It takes a long time, and much self-discipline, to make some progress toward rationality; for there are many causes of belief that are not good grounds for it--have no value as evidence. Evidence consists of (1) observation; (2) reasoning checked by observation and by logical principles; (3) memory--often inaccurate; (4) testimony--often untrustworthy, but indispensable, since all we learn from books or from other men is taken on testimony; (5) the agreement of all our results. On the other hand, belief is caused by many influences that are not evidence at all: such are (1) desire, which makes us believe in whatever serves our purpose; fear and suspicion, which (paradoxically) make us believe in whatever seems dangerous; (2) habit, which resists whatever disturbs our prejudices; (3) vanity, which delights to think oneself always right and consistent and disowns fallibility; (4) imitativeness, suggestibility, fashion, which carry us along with the crowd. All these, and nobler things, such as love and fidelity, fix our attention upon whatever seems to support our prejudices, and prevent our attending to any facts or arguments that threaten to overthrow them.

Sec. 3. Two departments of Logic are usually recognised, Deduction and Induction; that is, to describe them briefly, proof from principles, and proof from facts. Classification is sometimes made a third department; sometimes its topics are distributed amongst those of the former two. In the present work the order adopted is, Deduction in chaps. ii. to xiii.; Induction in chaps. xiii. to xx.; and, lastly, Classification. But such divisions do not represent fundamentally distinct and opposed aspects of the science. For although, in discussing any question with an opponent who makes admissions, it may be possible to combat his views with merely deductive arguments based upon his admissions; yet in any question of general truth, Induction and Deduction are mutually dependent and imply one another.

This may be seen in one of the above examples. It was argued that a certain metal must be copper, because every metal is copper that turns green when dipped in vinegar. So far the proof appealed to a general proposition, and was deductive. But when we ask how the general proposition is known to be true, experiments or facts must be alleged; and this is inductive evidence. Deduction then depends on Induction. But if we ask, again, how any number of past experiments can prove a general proposition, which must be good for the future as well as for the past, the uniformity of causation is invoked; that is, appeal is made to a principle, and that again is deductive proof. Induction then depends upon Deduction.

We may put it in this way: Deduction depends on Induction, if general propositions are only known to us through the facts: Induction depends on Deduction, because one fact can never prove another, except so far as what is true of the one is true of the other and of any other of the same kind; and because, to exhibit this resemblance of the facts, it must be stated in a general proposition.

Sec. 4. The use of Logic is often disputed: those who have not studied it, often feel confident of their ability to do without it; those who have studied it, are sometimes disgusted with what they consider to be its superficial analysis of the grounds of evidence, or needless technicality in the discussion of details. As to those who, not having studied Logic, yet despise it, there will be time enough to discuss its utility with them, when they know something about it; and as for those who, having studied it, turn away in disgust, whether they are justified every man must judge for himself, when he has attained to equal proficiency in the subject. Meanwhile, the following considerations may be offered in its favour:

Logic states, and partly explains and applies, certain abstract principles which all other sciences take for granted; namely, the axioms above mentioned--the principles of Contradiction, of the Syllogism and of Causation. By exercising the student in the apprehension of these truths, and in the application of them to particular propositions, it educates the power of abstract thought. Every science is a model of method, a discipline in close and consecutive thinking; and this merit Logic ought to possess in a high degree.

For ages Logic has served as an introduction to Philosophy that is, to Metaphysics and speculative Ethics. It is of old and honourable descent: a man studies Logic in very good company. It is the warp upon which nearly the whole web of ancient, mediaeval and modern Philosophy is woven. The history of thought is hardly intelligible without it.

As the science of proof, Logic gives an account of the _general_ nature of evidence deductive and inductive, as applied in the physical and social sciences and in the affairs of life. The _general_ nature of such evidence: it would be absurd of the logician to pretend to instruct the chemist, economist and merchant, as to the _special_ character of the evidence requisite in their several spheres of judgment. Still, by investigating the general conditions of proof, he sets every man upon his guard against the insufficiency of evidence.

One application of the science of proof deserves special mention: namely, to that department of Rhetoric which has been the most developed, relating to persuasion by means of oratory, leader-writing, or pamphleteering. It is usually said that Logic is useful to convince the judgment, not to persuade the will: but one way of persuading the will is to convince the judgment that a certain course is advantageous; and although this is not always the readiest way, it is the most honourable, and leads to the most enduring results. Logic is the backbone of Rhetoric.

It has been disputed whether Logic is a science or an art; and, in fact, it may be considered in both ways. As a statement of general truths, of their relations to one another, and especially to the first principles, it is a science; but it is an art when, regarding truth as an end desired, it points out some of the means of attaining it--namely, to proceed by a regular method, to test every judgment by the principles of Logic, and to distrust whatever cannot be made consistent with them. Logic does not, in the first place, teach us to reason. We learn to reason as we learn to walk and talk, by the natural growth of our powers with some assistance from friends and neighbours. The way to develop one's power of reasoning is, first, to set oneself problems and try to solve them. Secondly, since the solving of a problem depends upon one's ability to call to mind parallel cases, one must learn as many facts as possible, and keep on learning all one's life; for nobody ever knew enough. Thirdly one must check all results by the principles of Logic. It is because of this checking, verifying, corrective function of Logic that it is sometimes called a Regulative or Normative Science. It cannot give any one originality or fertility of invention; but it enables us to check our inferences, revise our conclusions, and chasten the vagaries of ambitious speculation. It quickens our sense of bad reasoning both in others and in ourselves. A man who reasons deliberately, manages it better after studying Logic than he could before, if he is sincere about it and has common sense.

Sec. 5. The relation of Logic to other sciences:

(a) Logic is regarded by Spencer as co-ordinate with Mathematics, both being Abstract Sciences--that is, sciences of the _relations_ in which things stand to one another, whatever the particular things may be that are so related; and this view seems to be, on the whole, just--subject, however, to qualifications that will appear presently.

Mathematics treats of the relations of all sorts of things considered as quantities, namely, as equal to, or greater or less than, one another. Things may be quantitatively equal or unequal in _degree_, as in comparing the temperature of bodies; or in _duration_; or in _spatial magnitude_, as with lines, superficies, solids; or in _number_. And it is assumed that the equality or inequality of things that cannot be directly compared, may be proved indirectly on the assumption that 'things equal to the same thing are equal,' etc.

Logic also treats of the relations of all sorts of things, but not as to their quantity. It considers (i) that one thing may be like or unlike another in certain attributes, as that iron is in many ways like tin or lead, and in many ways unlike carbon or sulphur: (ii) that attributes co-exist or coinhere (or do not) in the same subject, as metallic lustre, hardness, a certain atomic weight and a certain specific gravity coinhere in iron: and (iii) that one event follows another (or is the effect of it), as that the placing of iron in water causes it to rust. The relations of likeness and of coinherence are the ground of Classification; for it is by resemblance of coinhering attributes that things form classes: coinherence is the ground of judgments concerning Substance and Attribute, as that iron is metallic; and the relation of succession, in the mode of Causation, is the chief subject of the department of Induction. It is usual to group together these relations of attributes and of order in time, and call them qualitative, in order to contrast them with the quantitative relations which belong to Mathematics. And it is assumed that qualitative relations of things, when they cannot be directly perceived, may be proved indirectly by assuming the axiom of the Syllogism (chap. ix.) and the law of Causation (chap. xiv.).

So far, then, Logic and Mathematics appear to be co-ordinate and distinct sciences. But we shall see hereafter that the satisfactory treatment of that special order of events in time which constitutes Causation, requires a combination of Logic with Mathematics; and so does the treatment of Probability. And, again, Logic may be said to be, in a certain sense, 'prior to' or 'above' Mathematics

as usually treated. For the Mathematics assume that one magnitude must be either equal or unequal to another, and that it cannot be both equal and unequal to it, and thus take for granted the principles of Contradiction and Excluded Middle; but the statement and elucidation of these Principles are left to Logic (chap. vi.). The Mathematics also classify and define magnitudes, as (in Geometry) triangles, squares, cubes, spheres; but the principles of classification and definition remain for Logic to discuss.

(b) As to the concrete Sciences, such as Astronomy, Chemistry, Zoology, Sociology--Logic (as well as Mathematics) is implied in them all; for all the propositions of which they consist involve causation, co-existence, and class-likeness. Logic is therefore said to be prior to them or above them: meaning by 'prior' not that it should be studied earlier, for that is not a good plan; meaning by 'above' not in dignity, for distinctions of dignity amongst liberal studies are absurd. But it is a philosophical idiom to call the abstract 'prior to,' or 'higher than,' the concrete (see Porphyry's Tree, chap. xxii. Sec. 8); and Logic is more abstract than Astronomy or Sociology. Philosophy may thank that idiom for many a foolish notion.

(c) But, as we have seen, Logic does not investigate the truth, trustworthiness, or validity of its own principles; nor does Mathematics: this task belongs to Metaphysics, or Epistemology, the criticism of knowledge and beliefs.

Logic assumes, for example, that things are what to a careful scrutiny they seem to be; that animals, trees, mountains, planets, are bodies with various attributes, existing in space and changing in time; and that certain principles, such as Contradiction and Causation, are true of things and events. But Metaphysicians have raised many plausible objections to these assumptions. It has been urged that natural objects do not really exist on their own account, but only in dependence on some mind that contemplates them, and that even space and time are only our way of perceiving things; or, again, that although things do really exist on their own account, it is in an entirely different way from that in which we know them. As to the principle of Contradiction--that if an object has an attribute, it cannot at the same time and in the same way be without it (e.g., if an animal is conscious, it is false that it is not conscious)--it has been contended that the speciousness of this principle is only due to the obtuseness of our minds, or even to the poverty of language, which cannot make the fine distinctions that exist in Nature. And as to Causation, it is sometimes doubted whether events always have physical causes; and it is often suggested that, granting they have physical causes, yet these are such as we can neither perceive nor conceive; belonging not to the order of Nature as we know it, but to the secret inwardness and reality of Nature, to the wells and reservoirs of power, not to the spray of the fountain that glitters in our eyes--'occult causes,' in short. Now these doubts and surmises are metaphysical spectres which it remains for Metaphysics to lay. Logic has no direct concern with them (although, of course, metaphysical discussion is expected to be logical), but keeps the plain path of plain beliefs, level with the comprehension of plain men. Metaphysics, as examining the grounds of Logic itself, is sometimes regarded as 'the higher Logic'; and, certainly, the study of Metaphysics is necessary to every one who would comprehend the nature and functions of Logic, or the place of his own mind and of Reason in the world.

(d) The relation of Logic to Psychology will be discussed in the next section.

(e) As a Regulative Science, pointing out the conditions of true inference (within its own sphere), Logic is co-ordinate with (i) Ethics, considered as assigning the conditions of right conduct, and with (ii) AEsthetics, considered as determining the principles of criticism and good taste.

Sec. 6. Three principal schools of Logicians are commonly recognised: Nominalist, Conceptualist, and Materialist, who differ as to what it is that Logic really treats of: the Nominalists say, 'of language'; the Conceptualists, 'of thought'; the Materialists, 'of relations of fact.' To illustrate these positions let us take authors who, if some of them are now neglected, have the merit of stating their contrasted views with a distinctness that later refinements tend to obscure.

(a) Whately, a well-known Nominalist, regarded Logic as the Science and Art of Reasoning, but at the same time as "entirely conversant about language"; that is to say, it is the business of Logic to discover those modes of statement which shall ensure the cogency of an argument, no matter what may be the subject under discussion. Thus, _All fish are cold-blooded_, .'. _some cold-blooded things are fish:_ this is a sound inference by the mere manner of expression; and equally sound is the inference, _All fish are warm-blooded_, .'. _some warm-blooded things are fish_. The latter proposition may be false, but it follows; and (according to this doctrine) Logic is only concerned with the consistent use of words: the truth or falsity of the proposition itself is a question for Zoology. The short-coming of extreme Nominalism lies in speaking of language as if its meaning were unimportant. But Whately did not intend this: he was a man of great penetration and common-sense.

(b) Hamilton, our best-known Conceptualist, defined Logic as the science of the "formal laws of thought," and "of thought as thought," that is, without regard to the matter thought about. Just as Whately regarded Logic as concerned merely with cogent

forms of statement, so Hamilton treated it as concerned merely with the necessary relations of thought. This doctrine is called Conceptualism, because the simplest element of thought is the Concept; that is, an abstract idea, such as is signified by the word _man, planet, colour, virtue_; not a representative or generic image, but the thought of all attributes common to any class of things. Men, planets, colours, virtuous actions or characters, have, severally, something in common on account of which they bear these general names; and the thought of what they have in common, as the ground of these names, is a Concept. To affirm or deny one concept of another, as _Some men are virtuous_, or _No man is perfectly virtuous_, is to form a Judgment, corresponding to the Proposition of which the other schools of Logic discourse. Conceptualism, then, investigates the conditions of consistent judgment.

To distinguish Logic from Psychology is most important in connection with Conceptualism. Concepts and Judgments being mental acts, or products of mental activity, it is often thought that Logic must be a department of Psychology. It is recognised of course, that Psychology deals with much more than Logic does, with sensation, pleasure and pain, emotion, volition; but in the region of the intellect, especially in its most deliberate and elaborate processes, namely, conception, judgment, and reasoning, Logic and Psychology seem to occupy common ground. In fact, however, the two sciences have little in common except a few general terms, and even these they employ in different senses. It is usual to point out that Psychology tries to explain the subjective _processes_ of conception, judgment and reasoning, and to give their natural history; but that Logic is wholly concerned with the _results_ of such processes, with concepts, judgments and reasonings, and merely with the validity of the results, that is, with their truth or consistency; whilst Psychology has nothing to do with their validity, but only with their causes. Besides, the logical judgment (in Formal Logic at least) is quite a different thing from the psychological: the latter involves feeling and belief, whereas the former is merely a given relation of concepts. _S is P_: that is a model logical judgment; there can be no question of believing it; but it is logically valid if _M is P_ and _S is M_. When, again, in Logic, one deals with belief, it depends upon evidence; whereas, in Psychology belief is shown to depend upon causes which may have evidentiary value or may not; for Psychology explains quite impartially the growth of scientific insight and the growth of prejudice.

(c) Mill, Bain, and Venn are the chief Materialist logicians; and to guard against the error of confounding Materialism in Logic with the ontological doctrine that nothing exists but Matter, it may suffice to remember that in Metaphysics all these philosophers are Idealists. Materialism in Logic consists in regarding propositions as affirming or denying relations (_cf._ Sec. 5) between matters-of-fact in the widest sense; not only physical facts, but ideas, social and moral relations; it consists, in short, in attending to the meaning of propositions. It treats the first principles of Contradiction and Causation as true of things so far as they are known to us, and not merely as conditions or tendencies of thought; and it takes these principles as conditions of right thinking, because they seem to hold good of Nature and human life.

To these differences of opinion it will be necessary to recur in the next chapter (Sec. 4); but here I may observe that it is easy to exaggerate their importance in Logic. There is really little at issue between schools of logicians as such, and as far as their doctrines run parallel; it is on the metaphysical grounds of their study, or as to its scope and comprehension, that they find a battle-field. The present work generally proceeds upon the third, or Materialist doctrine. If Deduction and Induction are regarded as mutually dependent parts of one science, uniting the discipline of consistent discourse with the method of investigating laws of physical phenomena, the Materialist doctrine, that the principles of Logic are founded on fact, seems to be the most natural way of thinking. But if the unity of Deduction and Induction is not disputed by the other schools, the Materialist may regard them as allies exhibiting in their own way the same body of truths. The Nominalist may certainly claim that his doctrine is indispensable: consistently cogent forms of statement are necessary both to the Conceptualist and to the Materialist; neither the relations of thought nor those of fact can be arrested or presented without the aid of language or some equivalent system of signs. The Conceptualist may urge that the Nominalist's forms of statement and argument exist for the sake of their meaning, namely, judgments and reasonings; and that the Materialist's laws of Nature are only judgments founded upon our conceptions of Nature; that the truth of observations and experiments depends upon our powers of perception; that perception is inseparable from understanding, and that a system of Induction may be constructed upon the axiom of Causation, regarded as a principle of Reason, just as well as by considering it as a law of Nature, and upon much the same lines. The Materialist, admitting all this, may say that a judgment is only the proximate meaning of a proposition, and that the ultimate meaning, the meaning of the judgment itself, is always some matter-of-fact; that the other schools have not hitherto been eager to recognise the unity of Deduction and Induction or to investigate the conditions of trustworthy experiments and observations within the limits of human understanding; that thought is itself a sort of fact, as complex in its structure, as profound in its relations, as subtle in its changes as any other fact, and therefore at least as hard to know; that to turn away from the full reality of thought in perception, and to confine Logic to artificially limited concepts, is to abandon the effort to push method to the utmost and to get as near truth as possible; and that as to Causation being a principle of Reason rather than of Nature, the distinction escapes his apprehension, since Nature seems to be

that to which our private minds turn upon questions of Causation for correction and instruction; so that if he does not call Nature the Universal Reason, it is because he loves severity of style.

CHAPTER II

GENERAL ANALYSIS OF PROPOSITIONS

Sec. 1. Since Logic discusses the proof or disproof, or (briefly) the testing of propositions, we must begin by explaining their nature. A proposition, then, may first be described in the language of grammar as _a sentence indicative_; and it is usually expressed in the present tense.

It is true that other kinds of sentences, optative, imperative, interrogative, exclamatory, if they express or imply an assertion, are not beyond the view of Logic; but before treating such sentences, Logic, for greater precision, reduces them to their equivalent sentences indicative. Thus, _I wish it were summer_ may be understood to mean, _The coming of summer is an object of my desire_. _Thou shalt not kill_ may be interpreted as _Murderers are in danger of the judgment_. Interrogatories, when used in argument, if their form is affirmative, have negative force, and affirmative force if their form is negative. Thus, _Do hypocrites love virtue?_ anticipates the answer, _No_. _Are not traitors the vilest of mankind?_ anticipates the answer, _Yes_. So that the logical form of these sentences is, _Hypocrites are not lovers of virtue_; _Traitors are the vilest of mankind_. Impersonal propositions, such as _It rains_, are easily rendered into logical forms of equivalent meaning, thus: _Rain is falling_; or (if that be tautology), _The clouds are raining_. Exclamations may seem capricious, but are often part of the argument. _Shade of Chatham!_ usually means _Chatham, being aware of our present foreign policy, is much disgusted_. It is in fact, an appeal to authority, without the inconvenience of stating what exactly it is that the authority declares.

Sec. 2. But even sentences indicative may not be expressed in the way most convenient to logicians. _Salt dissolves in water_ is a plain enough statement; but the logician prefers to have it thus: _Salt is soluble in water_. For he says that a proposition is analysable into three elements: (1) a Subject (as _Salt_) about which something is asserted or denied; (2) a Predicate (as _soluble in water_) which is asserted or denied of the Subject, and (3) the Copula (_is_ or _are_, or _is not_ or _are not_), the sign of relation between the Subject and Predicate. The Subject and Predicate are called the Terms of the proposition: and the Copula may be called the sign of predication, using the verb 'to predicate' indefinitely for either 'to affirm' or 'to deny.' Thus _S is P_ means that the term _P_ is given as related in some way to the term _S_. We may, therefore, further define a Proposition as 'a sentence in which one term is predicated of another.'

In such a proposition as _Salt dissolves_, the copula (_is_) is contained in the predicate, and, besides the subject, only one element is exhibited: it is therefore said to be _secundi adjacentis_. When all three parts are exhibited, as in _Salt is soluble_, the proposition is said to be _tertii adjacentis_.

For the ordinary purposes of Logic, in predicating attributes of a thing or class of things, the copula _is_, or _is not_, sufficiently represents the relation of subject and predicate; but when it is desirable to realise fully the nature of the relation involved, it may be better to use a more explicit form. Instead of saying _Salt--is--soluble_, we may say _Solubility--coinheres with--the nature of salt_, or _The putting of salt in water--is a cause of--its dissolving_: thus expanding the copula into a full expression of the relation we have in view, whether coinherence or causation.

Sec. 3. The sentences of ordinary discourse are, indeed, for the most part, longer and more complicated than the logical form of propositions; it is in order to prove them, or to use them in the proof of other propositions, that they are in Logic reduced as nearly as possible to such simple but explicit expressions as the above (_tertii adjacentis_). A Compound Proposition, reducible to two or more simple ones, is said to be exponible.

The modes of compounding sentences are explained in every grammar-book. One of the commonest forms is the copulative, such as _Salt is both savoury and wholesome_, equivalent to two simple propositions: _Salt is savoury; Salt is wholesome. Pure water is neither sapid nor odorous_, equivalent to _Water is not sapid; Water is not odorous_. Or, again, _Tobacco is injurious, but not when used in moderation_, equivalent to _Much tobacco is injurious; a little is not_.

Another form of Exponible is the Exceptive, as _Kladderadatsch is published daily, except on week-days_, equivalent to _Kladderadatsch is published on Sunday; it is not published any other day_. Still another Exponible is the Exclusive, as _Only men use fire_, equivalent to _Men are users of fire; No other animals are_. Exceptive and exclusive sentences are, however, equivalent

forms; for we may say, _Kladderadatsch is published only on Sunday_; and _No animals use fire, except men_.

There are other compound sentences that are not exponible, since, though they contain two or more verbal clauses, the construction shows that these are inseparable. Thus, _If cats are scarce, mice are plentiful_, contains two verbal clauses; but _if cats are scarce_ is conditional, not indicative; and _mice are plentiful_ is subject to the condition that _cats are scarce_. Hence the whole sentence is called a Conditional Proposition. For the various forms of Conditional Propositions see chap. v. Sec. 4.

But, in fact, to find the logical force of recognised grammatical forms is the least of a logician's difficulties in bringing the discourses of men to a plain issue. Metaphors, epigrams, innuendoes and other figures of speech present far greater obstacles to a lucid reduction whether for approval or refutation. No rules can be given for finding everybody's meaning. The poets have their own way of expressing themselves; sophists, too, have their own way. And the point often lies in what is unexpressed. Thus, "barbarous nations make, the civilised write history," means that civilised nations do not make history, which none is so brazen as openly to assert. Or, again, "Alcibiades is dead, but X is still with us"; the whole meaning of this 'exponible' is that X would be the lesser loss to society. Even an epithet or a suffix may imply a proposition: _This personage_ may mean _X is a pretentious nobody_.

How shall we interpret such illusive predications except by cultivating our literary perceptions, by reading the most significant authors until we are at home with them? But, no doubt, to disentangle the compound propositions, and to expand the abbreviations of literature and conversation, is a useful logical exercise. And if it seem a laborious task thus to reduce to its logical elements a long argument in a speech or treatise, it should be observed that, as a rule, in a long discourse only a few sentences are of principal importance to the reasoning, the rest being explanatory or illustrative digression, and that a close scrutiny of these cardinal sentences will frequently dispense us from giving much attention to the rest.

Sec. 4. But now, returning to the definition of a Proposition given in Sec. 2, that it is 'a sentence in which one term is predicated of another,' we must consider what is the import of such predication. For the definition, as it stands, seems to be purely Nominalist. Is a proposition nothing more than a certain synthesis of words; or, is it meant to correspond with something further, a synthesis of ideas, or a relation of facts?

Conceptualist logicians, who speak of judgments instead of propositions, of course define the judgment in their own language. According to Hamilton, it is "a recognition of the relation of congruence or confliction in which two concepts stand to each other." To lighten the sentence, I have omitted one or two qualifications (Hamilton's _Lectures on Logic_, xiii.). "Thus," he goes on "if we compare the thoughts _water_, _iron_, and _rusting_, we find them congruent, and connect them into a single thought, thus: _water rusts iron_--in that case we form a judgment." When a judgment is expressed in words, he says, it is called a proposition.

But has a proposition no meaning beyond the judgment it expresses? Mill, who defines it as "a portion of discourse in which a predicate is affirmed or denied of a subject" (_Logic_, Book 1., chap. iv. Sec. 1.), proceeds to inquire into the import of propositions (Book 1., chap. v.), and finds three classes of them: (a) those in which one proper name is predicated of another; and of these Hobbes's Nominalist definition is adequate, namely, that a proposition asserts or denies that the predicate is a name for the same thing as the subject, as _Tully is Cicero_.

(b) Propositions in which the predicate means a part (or the whole) of what the subject means, as _Horses are animals_, _Man is a rational animal_. These are Verbal Propositions (see below: chap. v. Sec. 6), and their import consists in affirming or denying a coincidence between the meanings of names, as _The meaning of 'animal' is part of the meaning of 'horse.'_ They are partial or complete definitions.

But (c) there are also Real Propositions, whose predicates do not mean the same as their subjects, and whose import consists in affirming or denying one of five different kinds of matter of fact: (1) That the subject exists, or does not; as if we say _The bison exists_, _The great auk is extinct_. (2) Co-existence, as _Man is mortal_; that is, _the being subject to death coinheres with the qualities on account of which we call certain objects men_. (3) Succession, as _Night follows day_. (4) Causation (a particular kind of Succession), as _Water rusts iron_. (5) Resemblance, as _The colour of this geranium is like that of a soldier's coat_, or _A = B_.

On comparing this list of real predications with the list of logical relations given above (chap. i. Sec. 5 (a)), it will be seen that the two differ only in this, that I have there omitted simple Existence. Nothing simply exists, unrelated either in Nature or in knowledge. Such a proposition as _The bison exists_ may, no doubt, be used in Logic (subject to interpretation) for the sake of custom or for the sake of brevity; but it means that some specimens are still to be found in N. America, or in Zoological gardens.

Controversy as to the Import of Propositions really turns upon a difference of opinion as to the scope of Logic and the foundations of knowledge. Mill was dissatisfied with the "congruity" of concepts as the basis of a judgment. Clearly, mere congruity does not justify belief. In the proposition _Water rusts iron_, the concepts _water_, _rust_ and _iron_ may be congruous, but does any one assert their connection on that ground? In the proposition _Murderers are haunted by the ghosts of their victims_, the concepts _victim_, _murderer_, _ghost_ have a high degree of congruity; yet, unfortunately, I cannot believe it: there seems to be no such cheap defence of innocence. Now, Mill held that Logic is concerned with the grounds of belief, and that the scope of Logic includes Induction as well as Deduction; whereas, according to Hamilton, Induction is only Modified Logic, a mere appendix to the theory of the "forms of thought as thought." Indeed, Mill endeavoured in his _Logic_ to probe the grounds of belief deeper than usual, and introduced a good deal of Metaphysics--either too much or not enough--concerning the ground of axioms. But, at any rate, his great point was that belief, and therefore (for the most part) the Real Proposition, is concerned not merely with the relations of words, or even of ideas, but with matters of fact; that is, both propositions and judgments point to something further, to the relations of things which we can examine, not merely by thinking about them (comparing them in thought), but by observing them with the united powers of thought and perception. This is what convinces us that _water rusts iron_: and the difficulty of doing this is what prevents our feeling sure that _murderers are haunted by the ghosts of their victims_. Hence, although Mill's definition of a proposition, given above, is adequate for propositions in general; yet that kind of proposition (the Real) with regard to which Logic (in Mill's view) investigates the conditions of proof, may be more explicitly and pertinently defined as 'a predication concerning the relation of matters of fact.'

Sec. 5. This leads to a very important distinction to which we shall often have to refer in subsequent pages--namely, the distinction between the Form and the Matter of a proposition or of an argument. The distinction between Form and Matter, as it is ordinarily employed, is easily understood. An apple growing in the orchard and a waxen apple on the table may have the same shape or form, but they consist of different materials; two real apples may have the same shape, but contain distinct ounces of apple-stuff, so that after one is eaten the other remains to be eaten. Similarly, tables may have the same shape, though one be made of marble, another of oak, another of iron. The form is common to several things, the matter is peculiar to each. Metaphysicians have carried the distinction further: apples, they say, may have not only the same outward shape, but the same inward constitution, which, therefore, may be called the Form of apple-stuff itself--namely, a certain pulpiness, juiciness, sweetness, etc.; qualities common to all dessert apples: yet their Matter is different, one being here, another there--differing in place or time, if in nothing else. The definition of a species is the form of every specimen of it.

To apply this distinction to the things of Logic: it is easy to see how two propositions may have the same Form but different Matter: not using 'Form' in the sense of 'shape,' but for that which is common to many things, in contrast with that which is peculiar to each. Thus, _All male lions are tawny_ and _All water is liquid at 50 deg. Fahrenheit_, are two propositions that have the same form, though their matter is entirely different. They both predicate something of the whole of their subjects, though their subjects are different, and so are the things predicated of them. Again, _All male lions have tufted tails_ and _All male lions have manes_, are two propositions having the same form and, in their subjects, the same matter, but different matter in their predicates. If, however, we take two such propositions as these: _All male lions have manes_ and _Some male lions have manes_, here the matter is the same in both, but the form is different--in the first, predication is made concerning _every_ male lion; in the second of only _some_ male lions; the first is _universal_, the second is _particular_. Or, again, if we take _Some tigers are man-eaters_ and _Some tigers are not man-eaters_, here too the matter is the same, but the form is different; for the first proposition is _affirmative_, whilst the second is _negative_.

Sec. 6. Now, according to Hamilton and Whately, pure Logic has to do only with the Form of propositions and arguments. As to their Matter, whether they are really true in fact, that is a question, they said, not for Logic, but for experience, or for the special sciences. But Mill desired so to extend logical method as to test the material truth of propositions: he thought that he could expound a method by which experience itself and the conclusions of the special sciences may be examined.

To this method it may be objected, that the claim to determine Material Truth takes for granted that the order of Nature will remain unchanged, that (for example) water not only at present is a liquid at 50 deg. Fahrenheit, but will always be so; whereas (although we have no reason to expect such a thing) the order of Nature may alter--it is at least supposable--and in that event water may freeze at such a temperature. Any matter of fact, again, must depend on observation, either directly, or by inference--as when something is asserted about atoms or ether. But observation and material inference are subject to the limitations of our faculties; and however we may aid observation by microscopes and micrometers, it is still observation; and however we may correct our observations by repetition, comparison and refined mathematical methods of making allowances, the correction of error is only an

approximation to accuracy. Outside of Formal Reasoning, suspense of judgment is your only attitude.

But such objections imply that nothing short of absolute truth has any value; that all our discussions and investigations in science or social affairs are without logical criteria; that Logic must be confined to symbols, and considered entirely as mental gymnastics. In this book prominence will be given to the character of Logic as a formal science, and it will also be shown that Induction itself may be treated formally; but it will be assumed that logical forms are valuable as representing the actual relations of natural and social phenomena.

Sec. 7. Symbols are often used in Logic instead of concrete terms, not only in Symbolic Logic where the science is treated algebraically (as by Dr. Venn in his _Symbolic Logic_), but in ordinary manuals; so that it may be well to explain the use of them before going further.

It is a common and convenient practice to illustrate logical doctrines by examples: to show what is meant by a Proposition we may give _salt is soluble_, or _water rusts iron:_ the copulative exponible is exemplified by _salt is savoury and wholesome_; and so on. But this procedure has some disadvantages: it is often cumbrous; and it may distract the reader's attention from the point to be explained by exciting his interest in the special fact of the illustration. Clearly, too, so far as Logic is formal, no particular matter of fact can adequately illustrate any of its doctrines. Accordingly, writers on Logic employ letters of the alphabet instead of concrete terms, (say) _X_ instead of _salt_ or instead of _iron_, and (say) _Y_ instead of _soluble_ or instead of _rusted by water_; and then a proposition may be represented by _X is Y_. It is still more usual to represent a proposition by _S is (or is not) P, S_ being the initial of Subject and _P_ of Predicate; though this has the drawback that if we argue--_S is P_, therefore _P is S_, the symbols in the latter proposition no longer have the same significance, since the former subject is now the predicate.

Again, negative terms frequently occur in Logic, such as _not-water_, or _not-iron_, and then if _water_ or _iron_ be expressed by _X_, the corresponding negative may be expressed by _x_; or, generally, if a capital letter stand for a positive term, the corresponding small letter represents the negative. The same device may be adopted to express contradictory terms: either of them being _X_, the other is _x_ (see chap. iv., Sec.Sec. 7-8); or the contradictory terms may be expressed by _x_ and _[x]_, _y_ and _[y]_.

And as terms are often compounded, it may be convenient to express them by a combination of letters: instead of illustrating such a case by _boiling water_ or _water that is boiling_, we may write _XY_; or since positive and negative terms may be compounded, instead of illustrating this by _water that is not boiling_, we may write _Xy_.

The convenience of this is obvious; but it is more than convenient; for, if one of the uses of Logic be to discipline the power of abstract thought, this can be done far more effectually by symbolic than by concrete examples; and if such discipline were the only use of Logic it might be best to discard concrete illustrations altogether, at least in advanced text-books, though no doubt the practice would be too severe for elementary manuals. On the other hand, to show the practical applicability of Logic to the arguments and proofs of actual life, or even of the concrete sciences, merely symbolic illustration may be not only useless but even misleading. When we speak of politics, or poetry, or species, or the weather, the terms that must be used can rarely have the distinctness and isolation of X and Y; so that the perfunctory use of symbolic illustration makes argument and proof appear to be much simpler and easier matters than they really are. Our belief in any proposition never rests on the proposition itself, nor merely upon one or two others, but upon the immense background of our general knowledge and beliefs, full of circumstances and analogies, in relation to which alone any given proposition is intelligible. Indeed, for this reason, it is impossible to illustrate Logic sufficiently: the reader who is in earnest about the cogency of arguments and the limitation of proofs, and is scrupulous as to the degrees of assent that they require, must constantly look for illustrations in his own knowledge and experience and rely at last upon his own sagacity.

CHAPTER III

OF TERMS AND THEIR DENOTATION

Sec. 1. In treating of Deductive Logic it is usual to recognise three divisions of the subject: first, the doctrine of Terms, words, or other signs used as subjects or predicates; secondly, the doctrine of Propositions, analysed into terms related; and, thirdly, the doctrine of the Syllogism in which propositions appear as the grounds of a conclusion.

The terms employed are either letters of the alphabet, or the words of common language, or the technicalities of science; and since the words of common language are most in use, it is necessary to give some account of common language as subserving the purposes of Logic. It has been urged that we cannot think or reason at all without words, or some substitute for them, such as the signs of algebra; but this is an exaggeration. Minds greatly differ, and some think by the aid of definite and comprehensive picturings, especially in dealing with problems concerning objects in space, as in playing chess blindfold, inventing a machine, planning a tour on an imagined map. Most people draw many simple inferences by means of perceptions, or of mental imagery. On the other hand, some men think a good deal without any continuum of words and without any imagery, or with none that seems relevant to the purpose. Still the more elaborate sort of thinking, the grouping and concatenation of inferences, which we call reasoning, cannot be carried far without language or some equivalent system of signs. It is not merely that we need language to express our reasonings and communicate them to others: in solitary thought we often depend on words--'talk to ourselves,' in fact; though the words or sentences that then pass through our minds are not always fully formed or articulated. In Logic, moreover, we have carefully to examine the grounds (at least the proximate grounds) of our conclusions; and plainly this cannot be done unless the conclusions in question are explicitly stated and recorded.

Conceptualists say that Logic deals not with the process of thinking (which belongs to Psychology) but with its results; not with conceiving but with concepts; not with judging but with judgments. Is the concept self-consistent or adequate? Logic asks; is the judgment capable of proof? Now, it is only by recording our thoughts in language that it becomes possible to distinguish between the process and the result of thought. Without language, the act and the product of thinking would be identical and equally evanescent. But by carrying on the process in language and remembering or otherwise recording it, we obtain a result which may be examined according to the principles of Logic.

Sec. 2. As Logic, then, must give some account of language, it seems desirable to explain how its treatment of language differs from that of Grammar and from that of Rhetoric.

Grammar is the study of the words of some language, their classification and derivation, and of the rules of combining them, according to the usage at any time recognised and followed by those who are considered correct writers or speakers. Composition may be faultless in its grammar, though dull and absurd.

Rhetoric is the study of language with a view to obtaining some special effect in the communication of ideas or feelings, such as picturesqueness in description, vivacity in narration, lucidity in exposition, vehemence in persuasion, or literary charm. Some of these ends are often gained in spite of faulty syntax or faulty logic; but since the few whom bad grammar saddens or incoherent arguments divert are not carried away, as they else might be, by an unsophisticated orator, Grammar and Logic are necessary to the perfection of Rhetoric. Not that Rhetoric is in bondage to those other sciences; for foreign idioms and such figures as the ellipsis, the anacoluthon, the oxymoron, the hyperbole, and violent inversions have their place in the magnificent style; but authors unacquainted with Grammar and Logic are not likely to place such figures well and wisely. Indeed, common idioms, though both grammatically and rhetorically justifiable, both correct and effective, often seem illogical. 'To fall asleep,' for example, is a perfect English phrase; yet if we examine severally the words it consists of, it may seem strange that their combination should mean anything at all.

But Logic only studies language so far as necessary in order to state, understand, and check the evidence and reasonings that are usually embodied in language. And as long as meanings are clear, good Logic is compatible with false concords and inelegance of style.

Sec. 3. Terms are either Simple or Composite: that is to say, they may consist either of a single word, as 'Chaucer,' 'civilisation'; or of more than one, as 'the father of English poetry,' or 'modern civilised nations.' Logicians classify words according to their uses in forming propositions; or, rather, they classify the uses of words as terms, not the words themselves; for the same word may fall into different classes of terms according to the way in which it is used. (Cf. Mr. Alfred Sidgwick's _Distinction and the Criticism of Beliefs_, chap. xiv.)

Thus words are classified as Categorematic or Syncategorematic. A word is Categorematic if used singly as a term without the support of other words: it is Syncategorematic when joined with other words in order to constitute the subject or predicate of a proposition. If we say _Venus is a planet whose orbit is inside the Earth's_, the subject, 'Venus,' is a word used categorematically as a simple term; the predicate is a composite term whose constituent words (whether substantive, relative, verb, or preposition) are used syncategorematically.

Prepositions, conjunctions, articles, adverbs, relative pronouns, in their ordinary use, can only enter into terms along with other words having a substantive, adjectival or participial force; but when they are themselves the things spoken of and are used substantively (_suppositio materialis_), they are categorematic. In the proposition, _'Of' was used more indefinitely three hundred years ago than it is now_, 'of' is categorematic. On the other hand, all substantives may be used categorematically; and the same self-sufficiency is usually recognised in adjectives and participles. Some, however, hold that the categorematic use of adjectives and participles is due to an ellipsis which the logician should fill up; that instead of _Gold is heavy_, he should say _Gold is a heavy metal_; instead of _The sun is shining_, _The sun is a body shining_. But in these cases the words 'metal' and 'body' are unmistakable tautology, since 'metal' is implied in gold and 'body' in sun. But, as we have seen, any of these kinds of word, substantive, adjective, or participle, may occur syncategorematically in connection with others to form a composite term.

Sec. 4. Most terms (the exceptions and doubtful cases will be discussed hereafter) have two functions, a denotative and a connotative. A term's denotative function is, to be the name or sign of something or some multitude of things, which are said to be called or denoted by the term. Its connotative function is, to suggest certain qualities and characteristics of the things denoted, so that it cannot be used literally as the name of any other things; which qualities and characteristics are said to be implied or connoted by the term. Thus 'sheep' is the name of certain animals, and its connotation prevents its being used of any others. That which a term directly indicates, then, is its _Denotation_; that sense or customary use of it which limits the Denotation is its _Connotation_ (ch. iv.). Hamilton and others use 'Extension' in the sense of Denotation, and 'Intension' or 'Comprehension' in the sense of Connotation. Now, terms may be classified, first according to what they stand for or denote; that is, according to their _Denotation_. In this respect, the use of a term is said to be either Concrete or Abstract.

A term is Concrete when it denotes a 'thing'; that is, any person, object, fact, event, feeling or imagination, considered as capable of having (or consisting of) qualities and a determinate existence. Thus 'cricket ball' denotes any object having a certain size, weight, shape, colour, etc. (which are its qualities), and being at any given time in some place and related to other objects--in the bowler's hands, on the grass, in a shop window. Any 'feeling of heat' has a certain intensity, is pleasurable or painful, occurs at a certain time, and affects some part or the whole of some animal. An imagination, indeed (say, of a fairy), cannot be said in the same sense to have locality; but it depends on the thinking of some man who has locality, and is definitely related to his other thoughts and feelings.

A term is Abstract, on the other hand, when it denotes a quality (or qualities), considered by itself and without determinate existence in time, place, or relation to other things. 'Size,' 'shape,' 'weight,' 'colour,' 'intensity,' 'pleasurableness,' are terms used to denote such qualities, and are then abstract in their denotation. 'Weight' is not something with a determinate existence at a given time; it exists not merely in some particular place, but wherever there is a heavy thing; and, as to relation, at the same moment it combines in iron with solidity and in mercury with liquidity. In fact, a quality is a point of agreement in a multitude of different things; all heavy things agree in weight, all round things in roundness, all red things in redness; and an abstract term denotes such a point (or points) of agreement among the things denoted by concrete terms. Abstract terms result from the analysis of concrete things into their qualities; and conversely a concrete term may be viewed as denoting the synthesis of qualities into an individual thing. When several things agree in more than one quality, there may be an abstract term denoting the union of qualities in which they agree, and omitting their peculiarities; as 'human nature' denotes the common qualities of men, 'civilisation' the common conditions of civilised peoples.

Every general name, if used as a concrete term, has, or may have, a corresponding abstract term. Sometimes the concrete term is modified to form the abstract, as 'greedy--greediness'; sometimes a word is adapted from another language, as 'man--humanity'; sometimes a composite term is used, as 'mercury--the nature of mercury,' etc. The same concrete may have several abstract correlatives, as 'man--manhood, humanity, human nature'; 'heavy--weight, gravity, ponderosity'; but in such cases the abstract terms are not used quite synonymously; that is, they imply different ways of considering the concrete.

Whether a word is used as a concrete or abstract term is in most instances plain from the word itself, the use of most words being pretty regular one way or the other; but sometimes we must judge by the context. 'Weight' may be used in the abstract for 'gravity,' or in the concrete for a measure; but in the latter sense it is syncategorematic (in the singular), needing at least the article 'a (or the) weight.' 'Government' may mean 'supreme political authority,' and is then abstract; or, the men who happen to be ministers, and is then concrete; but in this case, too, the article is usually prefixed. 'The life' of any man may mean his vitality (abstract), as in "Thus following life in creatures we dissect"; or, the series of events through which he passes (concrete), as in 'the life of Nelson as narrated by Southey.'

It has been made a question whether the denotation of an abstract term may itself be the subject of qualities. Apparently 'weight' may be greater or less, 'government' good or bad, 'vitality' intense or dull. But if every subject is modified by a quality, a quality is also modified by making it the subject of another; and, if so, it seems then to become a new quality. The compound terms 'great weight,' 'bad government,' 'dull vitality,' have not the same denotation as the simple terms 'weight, 'government,' 'vitality': they imply, and may be said to connote, more special concrete experience, such as the effort felt in lifting a trunk, disgust at the conduct of officials, sluggish movements of an animal when irritated. It is to such concrete experiences that we have always to refer in order fully to realise the meaning of abstract terms, and therefore, of course, to understand any qualification of them.

Sec. 5. Concrete terms may be subdivided according to the number of things they denote and the way in which they denote them. A term may denote one thing or many: if one, it is called Singular; if many, it may do so distributively, and then it is General; or, as taken all together, and then it is Collective: one, then; any one of many; many in one.

Among Singular Terms, each denoting a single thing, the most obvious are Proper Names, such as Gibraltar or George Washington, which are merely marks of individual things or persons, and may form no part of the common language of a country. They are thus distinguished from other Singular Terms, which consist of common words so combined as to restrict their denotation to some individual, such as, 'the strongest man on earth.'

Proper Terms are often said to be arbitrary signs, because their use does not depend upon any reason that may be given for them. Gibraltar had a meaning among the Moors when originally conferred; but no one now knows what it was, unless he happens to have learned it; yet the name serves its purpose as well as if it were "Rooke's Nest." Every Newton or Newport year by year grows old, but to alter the name would cause only confusion. If such names were given by mere caprice it would make no difference; and they could not be more cumbrous, ugly, or absurd than many of those that are given 'for reasons.'

The remaining kinds of Singular Terms are drawn from the common resources of the language. Thus the pronouns 'he,' 'she,' 'it,' are singular terms, whose present denotation is determined by the occasion and context of discourse: so with demonstrative phrases--'the man,' 'that horse.' Descriptive names may be more complex, as 'the wisest man of Gotham,' which is limited to some individual by the superlative suffix; or 'the German Emperor,' which is limited by the definite article--the general term 'German Emperor' being thereby restricted either to the reigning monarch or to the one we happen to be discussing. Instead of the definite, the indefinite article may be used to make general terms singular, as 'a German Emperor was crowned at Versailles' (_individua vaga_).

Abstract Terms are ostensively singular: 'whiteness' (e.g.) is one quality. But their full meaning is general: 'whiteness' stands for all white things, so far as white. Abstract terms, in fact, are only formally singular.

General Terms are words, or combinations of words, used to denote any one of many things that resemble one another in certain respects. 'George III.' is a Singular Term denoting one man; but 'King' is a General Term denoting him and all other men of the same rank; whilst the compound 'crowned head' is still more general, denoting kings and also emperors. It is the nature of a general term, then, to be used in the same sense of whatever it denotes; and its most characteristic form is the Class-name, whether of objects, such as 'king,' 'sheep,' 'ghost'; or of events, such as 'accession,' 'purchase,' 'manifestation.' Things and events are known by their qualities and relations; and every such aspect, being a point of resemblance to some other things, becomes a ground of generalisation, and therefore a ground for the need and use of general terms. Hence general terms are far the most important sort of terms in Logic, since in them general propositions are expressed and, moreover (with rare exceptions), all predicates are general. For, besides these typical class-names, attributive words are general terms, such as 'royal,' 'ruling,' 'woolly,' 'bleating,' 'impalpable,' 'vanishing.'

Infinitives may also be used as general terms, as '_To err is human_'; but for logical purposes they may have to be translated into equivalent substantive forms, as _Foolish actions are characteristic of mankind_. Abstract terms, too, are (as I observed) equivalent to general terms; 'folly' is abstract for 'foolish actions.' '_Honesty is the best policy_' means _people who are honest may hope to find their account in being so_; that is, in the effects of their honest actions, provided they are wise in other ways, and no misfortunes attend them. The abstract form is often much the more succinct and forcible, but for logical treatment it needs to be interpreted in the general form.

By antonomasia proper names may become general terms, as if we say _'A Johnson' would not have written such a book_--i.e., any man of his genius for elaborate eloquence.

A Collective Term denotes a multitude of similar things considered as forming one whole, as 'regiment,' 'flock,' 'nation': not distributively, that is, not the similar things severally; to denote them we must say 'soldiers of the regiment,' 'sheep of the flock,' and so on. If in a multitude of things there is no resemblance, except the fact of being considered as parts of one whole, as 'the world,' or 'the town of Nottingham' (meaning its streets and houses, open spaces, people, and civic organisation), the term denoting them as a whole is Singular; but 'the world' or 'town of Nottingham,' meaning the inhabitants only, is Collective.

In their strictly collective use, all such expressions are equivalent to singular terms; but many of them may also be used as general terms, as when we speak of 'so many regiments of the line,' or discuss the 'plurality of worlds'; and in this general use they denote any of a multitude of things of the same kind--regiments, or habitable worlds.

Names of substances, such as 'gold,' 'air,' 'water,' may be employed as singular, collective, or general terms; though, perhaps, as singular terms only figuratively, as when we say _Gold is king_. If we say with Thales, '_Water is the source of all things_,' 'water' seems to be used collectively. But substantive names are frequently used as general terms. For example, _Gold is heavy_ means 'in comparison with other things,' such as water. And, plainly, it does not mean that the aggregate of gold is heavier than the aggregate of water, but only that its specific gravity is greater; that is, bulk for bulk, any piece of gold is heavier than water.

Finally, any class-name may be used collectively if we wish to assert something of the things denoted by it, not distributively but altogether, as that _Sheep are more numerous than wolves_.

CHAPTER IV

THE CONNOTATION OF TERMS

Sec. 1. Terms are next to be classified according to their Connotation--that is, according to what they imply as characteristic of the things denoted. We have seen that general names are used to denote many things in the same sense, because the things denoted resemble one another in certain ways: it is this resemblance in certain points that leads us to class the things together and call them by the same name; and therefore the points of resemblance constitute the sense or meaning of the name, or its Connotation, and limit its applicability to such things as have these characteristic qualities. 'Sheep' for example, is used in the same sense, to denote any of a multitude of animals that resemble one another: their size, shape, woolly coats, cloven hoofs, innocent ways and edibility are well known. When we apply to anything the term 'sheep,' we imply that it has these qualities: 'sheep,' denoting the animal, connotes its possessing these characteristics; and, of course, it cannot, without a figure of speech or a blunder, be used to denote anything that does not possess all these qualities. It is by a figure of speech that the term 'sheep' is applied to some men; and to apply it to goats would be a blunder.

Most people are very imperfectly aware of the connotation of the words they use, and are guided in using them merely by the custom of the language. A man who employs a word quite correctly may be sadly posed by a request to explain or define it. Moreover, so far as we are aware of the connotation of terms, the number and the kind of attributes we think of, in any given case, vary with the depth of our interest, and with the nature of our interest in the things denoted. 'Sheep' has one meaning to a touring townsman, a much fuller one to a farmer, and yet a different one to a zoologist. But this does not prevent them agreeing in the use of the word, as long as the qualities they severally include in its meaning are not incompatible.

All general names, and therefore not only class-names, like 'sheep,' but all attributives, have some connotation. 'Woolly' denotes anything that bears wool, and connotes the fact of bearing wool; 'innocent' denotes anything that habitually and by its disposition does no harm (or has not been guilty of a particular offence), and connotes a harmless character (or freedom from particular guilt); 'edible' denotes whatever can be eaten with good results, and connotes its suitability for mastication, deglutition, digestion, and assimilation.

Sec. 2. But whether all terms must connote as well as denote something, has been much debated. Proper names, according to what seems the better opinion, are, in their ordinary use, not connotative. To say that they have no meaning may seem violent: if any one is called John Doe, this name, no doubt, means a great deal to his friends and neighbours, reminding them of his stature and physiognomy, his air and gait, his wit and wisdom, some queer stories, and an indefinite number of other things. But all this significance is local or accidental; it only exists for those who know the individual or have heard him described: whereas a general name gives information about any thing or person it denotes to everybody who understands the language, without any particular knowledge of the individual.

We must distinguish, in fact, between the peculiar associations of the proper name and the commonly recognised meaning of the general name. This is why proper names are not in the dictionary. Such a name as London, to be sure, or Napoleon Buonaparte, has a significance not merely local; still, it is accidental. These names are borne by other places and persons than those that have rendered them famous. There are Londons in various latitudes, and, no doubt, many Napoleon Buonapartes in Louisiana; and each name has in its several denotations an altogether different suggestiveness. For its suggestiveness is in each application determined by the peculiarities of the place or person denoted; it is not given to the different places (or to the different persons) because they have certain characteristics in common.

However, the scientific grounds of the doctrine that proper names are non-connotative, are these: The peculiarities that distinguish an individual person or thing are admitted to be infinite, and anything less than a complete enumeration of these peculiarities may fail to distinguish and identify the individual. For, short of a complete enumeration of them, the description may be satisfied by two or more individuals; and in that case the term denoting them, if limited by such a description, is not a proper but a general name, since it is applicable to two or more in the same sense. The existence of other individuals to whom it applies may be highly improbable; but, if it be logically possible, that is enough. On the other hand, the enumeration of infinite peculiarities is certainly impossible. Therefore proper names have no assignable connotation. The only escape from this reasoning lies in falling back upon time and place, the principles of individuation, as constituting the connotation of proper names. Two things cannot be at the same time in the same place: hence 'the man who was at a certain spot on the bridge of Lodi at a certain instant in a certain year' suffices to identify Napoleon Buonaparte for that instant. Supposing no one else to have borne the name, then, is this its connotation? No one has ever thought so. And, at any rate, time and place are only extrinsic determinations (suitable indeed to events like the battle of Lodi, or to places themselves like London); whereas the connotation of a general term, such as 'sheep,' consists of intrinsic qualities. Hence, then, the scholastic doctrine 'that individuals have no essence' (see chap. xxii. Sec. 9), and Hamilton's dictum 'that every concept is inadequate to to the individual,' are justified.

General names, when used as proper names, lose their connotation, as Euxine or Newfoundland.

Singular terms, other than Proper, have connotation; either in themselves, like the singular pronouns 'he,' 'she,' 'it,' which are general in their applicability, though singular in application; or, derivatively, from the general names that combine to form them, as in 'the first Emperor of the French' or the 'Capital of the British Empire.'

Sec. 3. Whether Abstract Terms have any connotation is another disputed question. We have seen that they denote a quality or qualities of something, and that is precisely what general terms connote: 'honesty' denotes a quality of some men; 'honest' connotes the same quality, whilst denoting the men who have it.

The denotation of abstract terms thus seems to exhaust their force or meaning. It has been proposed, however, to regard them as connoting the qualities they directly stand for, and not denoting anything; but surely this is too violent. To denote something is the same as to be the name of something (whether real or unreal), which every term must be. It is a better proposal to regard their denotation and connotation as coinciding; though open to the objection that 'connote' means 'to mark along with' something else, and this plan leaves nothing else. Mill thought that abstract terms are connotative when, besides denoting a quality, they suggest a quality of that quality (as 'fault' implies 'hurtfulness'); but against this it may be urged that one quality cannot bear another, since every qualification of a quality constitutes a distinct quality in the total ('milk-whiteness' is distinct from 'whiteness,' _cf._ chap. iii. Sec. 4). After all, if it is the most consistent plan, why not say that abstract, like proper, terms have no connotation?

But if abstract terms must be made to connote something, should it not be those things, indefinitely suggested, to which the qualities belong? Thus 'whiteness' may be considered to connote either snow or vapour, or any white thing, apart from one or other of which the quality has no existence; whose existence therefore it implies. By this course the denotation and connotation of abstract and of general names would be exactly reversed. Whilst the denotation of a general name is limited by the qualities connoted, the connotation of an abstract name includes all the things in which its denotation is realised. But the whole difficulty may be avoided by making it a rule to translate, for logical purposes, all abstract into the corresponding general terms.

Sec. 4. If we ask how the connotation of a term is to be known, the answer depends upon how it is used. If used scientifically, its connotation is determined by, and is the same as, its definition; and the definition is determined by examining the things to be denoted, as we shall see in chap. xxii. If the same word is used as a term in different sciences, as 'property' in Law and in Logic, it will be differently defined by them, and will have, in each use, a correspondingly different connotation. But terms used in popular discourse should, as far as possible, have their connotations determined by classical usage, i.e., by the sense in which they are

used by writers and speakers who are acknowledged masters of the language, such as Dryden and Burke. In this case the classical connotation determines the definition; so that to define terms thus used is nothing else than to analyse their accepted meanings.

It must not, however, be supposed that in popular use the connotation of any word is invariable. Logicians have attempted to classify terms into Univocal (having only one meaning) and AEquivocal (or ambiguous); and no doubt some words (like 'civil,' 'natural,' 'proud,' 'liberal,' 'humorous') are more manifestly liable to ambiguous use than some others. But in truth all general terms are popularly and classically used in somewhat different senses.

Figurative or tropical language chiefly consists in the transfer of words to new senses, as by metaphor or metonymy. In the course of years, too, words change their meanings; and before the time of Dryden our whole vocabulary was much more fluid and adaptable than it has since become. Such authors as Bacon, Milton, and Sir Thomas Browne often used words derived from the Latin in some sense they originally had in Latin, though in English they had acquired another meaning. Spenser and Shakespeare, besides this practice, sometimes use words in a way that can only be justified by their choosing to have it so; whilst their contemporaries, Beaumont and Fletcher, write the perfect modern language, as Dryden observed. Lapse of time, however, is not the chief cause of variation in the sense of words. The matters which terms are used to denote are often so complicated or so refined in the assemblage, interfusion, or gradation of their qualities, that terms do not exist in sufficient abundance and discriminativeness to denote the things and, at the same time, to convey by connotation a determinate sense of their agreements and differences. In discussing politics, religion, ethics, aesthetics, this imperfection of language is continually felt; and the only escape from it, short of coining new words, is to use such words as we have, now in one sense, now in another somewhat different, and to trust to the context, or to the resources of the literary art, in order to convey the true meaning. Against this evil the having been born since Dryden is no protection. It behoves us, then, to remember that terms are not classifiable into Univocal and AEquivocal, but that all terms are susceptible of being used aequivocally, and that honesty and lucidity require us to try, as well as we can, to use each term univocally in the same context.

The context of any proposition always proceeds upon some assumption or understanding as to the scope of the discussion, which controls the interpretation of every statement and of every word. This was called by De Morgan the "universe of discourse": an older name for it, revived by Dr. Venn, and surely a better one, is _suppositio_. If we are talking of children, and 'play' is mentioned, the _suppositio_ limits the suggestiveness of the word in one way; whilst if Monaco is the subject of conversation, the same word 'play,' under the influence of a different _suppositio_, excites altogether different ideas. Hence to ignore the _suppositio_ is a great source of fallacies of equivocation. 'Man' is generally defined as a kind of animal; but 'animal' is often used as opposed to and excluding man. 'Liberal' has one meaning under the _suppositio_ of politics, another with regard to culture, and still another as to the disposal of one's private means. Clearly, therefore, the connotation of general terms is relative to the _suppositio_, or "universe of discourse."

Sec. 5. Relative and Absolute Terms.--Some words go in couples or groups: like 'up-down,' 'former-latter,' 'father-mother-children,' 'hunter-prey,' 'cause-effect,' etc. These are called Relative Terms, and their nature, as explained by Mill, is that the connotations of the members of such a pair or group are derived from the same set of facts (the _fundamentum relationis_). There cannot be an 'up' without a 'down,' a 'father' without a 'mother' and 'child'; there cannot be a 'hunter' without something hunted, nor 'prey' without a pursuer. What makes a man a 'hunter' is his activities in pursuit; and what turns a chamois into 'prey' is its interest in these activities. The meaning of both terms, therefore, is derived from the same set of facts; neither term can be explained without explaining the other, because the relation between them is connoted by both; and neither can with propriety be used without reference to the other, or to some equivalent, as 'game' for 'prey.'

In contrast with such Relative Terms, others have been called Absolute or Non-relative. Whilst 'hunter' and 'prey' are relative, 'man' and 'chamois' have been considered absolute, as we may use them without thinking of any special connection between their meanings. However, if we believe in the unity of Nature and in the relativity of knowledge (that is, that all knowledge depends upon comparison, or a perception of the resemblances and differences of things), it follows that nothing can be completely understood except through its agreements or contrasts with everything else, and that all terms derive their connotation from the same set of facts, namely, from general experience. Thus both man and chamois are animals; this fact is an important part of the meaning of both terms, and to that extent they are relative terms. 'Five yards' and 'five minutes' are very different notions, yet they are profoundly related; for their very difference helps to make both notions distinct; and their intimate connection is shown in this, that five yards are traversed in a certain time, and that five minutes are measured by the motion of an index over some fraction of a yard upon the dial.

The distinction, then, between relative and non-relative terms must rest, not upon a fundamental difference between them (since, in fact, all words are relative), but upon the way in which words are used. We have seen that some words, such as 'up-down,' 'cause-effect,' can only be used relatively; and these may, for distinction, be called Correlatives. But other words, whose meanings are only partially interdependent, may often be used without attending to their relativity, and may then be considered as Absolute. We cannot say 'the hunter returned empty handed,' without implying that 'the prey escaped'; but we may say 'the man went supperless to bed,' without implying that 'the chamois rejoiced upon the mountain.' Such words as 'man' and 'chamois' may, then, in their use, be, as to one another, non-relative.

To illustrate further the relativity of terms, we may mention some of the chief classes of them.

Numerical order: 1st, 2nd, 3rd, etc.; 1st implies 2nd, and 2nd 1st; and 3rd implies 1st and 2nd, but these do not imply 3rd; and so on.

Order in Time or Place: before-after; early-punctual-late; right-middle-left; North-South, etc.

As to Extent, Volume, and Degree: greater-equal-less; large-medium-small; whole and part.

Genus and Species are a peculiar case of whole and part (_cf._ chaps. xxi.-ii.-iii.). Sometimes a term connotes all the attributes that another does, and more besides, which, as distinguishing it, are called differential. Thus 'man' connotes all that 'animal' does, and also (as _differentiae_) the erect gait, articulate speech, and other attributes. In such a case as this, where there are well-marked classes, the term whose connotation is included in the others' is called a Genus of that Species. We have a Genus, triangle; and a Species, isosceles, marked off from all other triangles by the differential quality of having two equal sides: again--Genus, book; Species, quarto; Difference, having each sheet folded into four leaves.

There are other cases where these expressions 'genus' and 'species' cannot be so applied without a departure from usage, as, e.g., if we call snow a species of the genus 'white,' for 'white' is not a recognised class. The connotation of white (i.e., whiteness) is, however, part of the connotation of snow, just as the qualities of 'animal' are amongst those of 'man'; and for logical purposes it is desirable to use 'genus and species' to express that relativity of terms which consists in the connotation of one being part of the connotation of the other.

Two or more terms whose connotations severally include that of another term, whilst at the same time exceeding it, are (in relation to that other term) called Co-ordinate. Thus in relation to 'white,' snow and silver are co-ordinate; in relation to colour, yellow and red and blue are co-ordinate. And when all the terms thus related stand for recognised natural classes, the co-ordinate terms are called co-ordinate species; thus man and chamois are (in Logic) co-ordinate species of the genus animal.

Sec. 6. From such examples of terms whose connotations are related as whole and part, it is easy to see the general truth of the doctrine that as connotation decreases, denotation increases: for 'animal,' with less connotation than man or chamois, denotes many more objects; 'white,' with less connotation than snow or silver, denotes many more things, It is not, however, certain that this doctrine is always true in the concrete: since there may be a term connoting two or more qualities, all of which qualities are peculiar to all the things it denotes; and, if so, by subtracting one of the qualities from its connotation, we should not increase its denotation. If 'man,' for example, has among mammals the two peculiar attributes of erect gait and articulate speech, then, by omitting 'articulate speech' from the connotation of man, we could not apply the name to any more of the existing mammalia than we can at present. Still we might have been able to do so; there might have been an erect inarticulate ape, and perhaps there once was one; and, if so, to omit 'articulate' from the connotation of man would make the term 'man' denote that animal (supposing that there was no other difference to exclude it). Hence, potentially, an increase of the connotation of any term implies a decrease of its denotation. And, on the other hand, we can only increase the denotation of a term, or apply it to more objects, by decreasing its connotation; for, if the new things denoted by the term had already possessed its whole connotation, they must already have been denoted by it. However, we may increase the _known_ denotation without decreasing the connotation, if we can discover the full connotation in things not formerly supposed to have it, as when dolphins were discovered to be mammals; or if we can impose the requisite qualities upon new individuals, as when by annexing some millions of Africans we extend the denotation of 'British subject' without altering its connotation.

Many of the things noticed in this chapter, especially in this section and the preceding, will be discussed at greater length in the chapters on Classification and Definition.

Sec. 7. Contradictory Relative Terms.--Every term has, or may have, another corresponding with it in such a way that, whatever differential qualities (Sec. 5) it connotes, this other connotes merely their absence; so that one or the other is always formally predicable of any Subject, but both these terms are never predicable of the same Subject in the same relation: such pairs of terms are called Contradictories. Whatever Subject we take, it is either visible or invisible, but not both; either human or non-human, but not both.

This at least is true formally, though in practice we should think ourselves trifled with if any one told us that 'A mountain is either human or non-human, but not both.' It is symbolic terms, such as X and x, that are properly said to be contradictories in relation to any subject whatever, S or M. For, as we have seen, the ordinary use of terms is limited by some _suppositio_, and this is true of Contradictories. 'Human' and 'non-human' may refer to zoological classification, or to the scope of physical, mental, or moral powers--as if we ask whether to flourish a dumbbell of a ton weight, or to know the future by intuition, or impeccability, be human or non-human. Similarly, 'visible' and 'invisible' refer either to the power of emitting or reflecting light, so that the words have no hold upon a sound or a scent, or else to power of vision and such qualifications as 'with the naked eye' or 'with a microscope.'

Again, the above definition of Contradictories tells us that they cannot be predicated of the same Subject "in the same relation"; that is, at the same time or place, or under the same conditions. The lamp is visible to me now, but will be invisible if I turn it out; one side of it is now visible, but the other is not: therefore without this restriction, "in the same relation," few or no terms would be contradictory.

If a man is called wise, it may mean 'on the whole' or 'in a certain action'; and clearly a man may for once be wise (or act wisely) who, on the whole, is not-wise. So that here again, by this ambiguity, terms that seem contradictory are predicable of the same subject, but not "in the same relation." In order to avoid the ambiguity, however, we have only to construct the term so as to express the relation, as 'wise on the whole'; and this immediately generates the contradictory 'not-wise on the whole.' Similarly, at one age a man may have black hair, at another not-black hair; but the difficulty is practically removable by stating the age referred to.

Still, this case easily leads us to a real difficulty in the use of contradictory terms, a difficulty arising from the continuous change or 'flux' of natural phenomena. If things are continually changing, it may be urged that contradictory terms are always applicable to the same subject, at least as fast as we can utter them: for if we have just said that a man's hair is black, since (like everything else) his hair is changing, it must now be not-black, though (to be sure) it may still seem black. The difficulty, such as it is, lies in this, that the human mind and its instrument language are not equal to the subtlety of Nature. All things flow, but the terms of human discourse assume a certain fixity of things; everything at every moment changes, but for the most part we can neither perceive this change nor express it in ordinary language.

This paradox, however, may, I suppose, be easily over-stated. The change that continually agitates Nature consists in the movements of masses or molecules, and such movements of things are compatible with a considerable persistence of their qualities. Not only are the molecular changes always going on in a piece of gold compatible with its remaining yellow, but its persistent yellowness depends on the continuance of some of those changes. Similarly, a man's hair may remain black for some years; though, no doubt, at a certain age its colour may begin to be problematical, and the applicability to it of 'black' or 'not-black' may become a matter of genuine anxiety. Whilst being on our guard, then, against fallacies of contradiction arising from the imperfect correspondence of fact with thought and language, we shall often have to put up with it. Candour and humility having been satisfied by the above acknowledgment of the subtlety of Nature, we may henceforward proceed upon the postulate--that it is possible to use contradictory terms such as cannot both be predicated of the same subject in the same relation, though one of them may be; that, for example, it may be truly said of a man for some years that his hair is black; and, if so, that during those years to call it not-black is false or extremely misleading.

The most opposed terms of the literary vocabulary, however, such as 'wise-foolish,' 'old-young,' 'sweet-bitter,' are rarely true contradictories: wise and foolish, indeed, cannot be predicated of the same man in the same relation; but there are many middling men, of whom neither can be predicated on the whole. For the comparison of quantities, again, we have three correlative terms, 'greater--equal--less,' and none of these is the contradictory of either of the others. In fact, the contradictory of any term is one that denotes the sum of its co-ordinates (Sec. 6); and to obtain a contradictory, the surest way is to coin one by prefixing to the given term the particle 'not' or (sometimes) 'non': as 'wise, not-wise,' 'human, non-human,' 'greater, not-greater.'

The separate word 'not' is surer to constitute a contradictory than the usual prefixes of negation, 'un-' or 'in-,' or even 'non'; since compounds of these are generally warped by common use from a purely negative meaning. Thus, 'Nonconformist' does not denote

everybody who fails to conform. 'Unwise' is not equivalent to 'not-wise,' but means 'rather foolish'; a very foolish action is not-wise, but can only be called unwise by meiosis or irony. Still, negatives formed by 'in' or 'un' or 'non' are sometimes really contradictory of their positives; as 'visible, invisible,' 'equal, unequal.'

Sec. 8. The distinction between Positive and Negative terms is not of much value in Logic, what importance would else attach to it being absorbed by the more definite distinction of contradictories. For contradictories are positive and negative in essence and, when least ambiguously stated, also in form. And, on the other hand, as we have seen, when positive and negative terms are not contradictory, they are misleading. As with 'wise-unwise,' so with many others, such as 'happy-unhappy'; which are not contradictories; since a man may be neither happy nor unhappy, but indifferent, or (again) so miserable that he can only be called unhappy by a figure of speech. In fact, in the common vocabulary a formal negative often has a limited positive sense; and this is the case with unhappy, signifying the state of feeling in the milder shades of Purgatory.

When a Negative term is fully contradictory of its Positive it is said to be Infinite; because it denotes an unascertained multitude of things, a multitude only limited by the positive term and the _suppositio_; thus 'not-wise' denotes all except the wise, within the _suppositio_ of 'intelligent beings.' Formally (disregarding any _suppositio_), such a negative term stands for all possible terms except its positive: x denotes everything but X; and 'not-wise' may be taken to include stones, triangles and hippogriffs. And even in this sense, a negative term has some positive meaning, though a very indefinite one, not a specific positive force like 'unwise' or 'unhappy': it denotes any and everything that has not the attributes connoted by the corresponding positive term.

Privative Terms connote the absence of a quality that normally belongs to the kind of thing denoted, as 'blind' or 'deaf.' We may predicate 'blind' or 'deaf' of a man, dog or cow that happens not to be able to see or hear, because the powers of seeing and hearing generally belong to those species; but of a stone or idol these terms can only be used figuratively. Indeed, since the contradictory of a privative carries with it the privative limitation, a stone is strictly 'not-blind': that is, it is 'not-something-that-normally-having-sight-wants-it.'

Contrary Terms are those that (within a certain genus or _suppositio_) severally connote differential qualities that are, in fact, mutually incompatible in the same relation to the same thing, and therefore cannot be predicated of the same subject in the same relation; and, so far, they resemble Contradictory Terms: but they differ from contradictory terms in this, that the differential quality connoted by each of them is definitely positive; no Contrary Term is infinite, but is limited to part of the _suppositio_ excluded by the others; so that, possibly, neither of two Contraries is truly predicable of a given subject. Thus 'blue' and 'red' are Contraries, for they cannot both be predicated of the same thing in the same relation; but are not Contradictories, since, in a given case, neither may be predicable: if a flower is blue in a certain part, it cannot in the same part be red; but it may be neither blue nor red, but yellow; though it is certainly either blue or not-blue. All co-ordinate terms are formal Contraries; but if, in fact, a series of co-ordinates comprises only two (as male-female), they are empirical Contradictories; since each includes all that area of the _suppositio_ which the other excludes.

The extremes of a series of co-ordinate terms are Opposites; as, in a list of colours, white and black, the most strongly contrasted, are said to be opposites, or as among moods of feeling, rapture and misery are opposites. But this distinction is of slight logical importance. Imperfect Positive and Negative couples, like 'happy and unhappy,' which (as we have seen) are not contradictories, are often called Opposites.

The members of any series of Contraries are all included by any one of them and its contradictory, as all colours come under 'red' and 'not-red,' all moods of feeling under 'happy' and 'not-happy.'

CHAPTER V

THE CLASSIFICATION OF PROPOSITIONS

Sec. 1. Logicians classify Propositions according to Quantity, Quality, Relation and Modality.

As to Quantity, propositions are either Universal or Particular; that is to say, the predicate is affirmed or denied either of the whole subject or of a part of it--of _All_ or of _Some S_.

All S is P (that is, _P_ is predicated of _all S_). _Some S is P_ (that is, _P_ is predicated of _some S_).

An Universal Proposition may have for its subject a singular term, a collective, a general term distributed, or an abstract term.

(1) A proposition having a singular term for its subject, as _The Queen has gone to France_, is called a Singular Proposition; and some Logicians regard this as a third species of proposition with respect to quantity, distinct from the Universal and Particular; but that is needless.

(2) A collective term may be the subject, as _The Black Watch is ordered to India_. In this case, as well as in singular propositions, a predication is made concerning the whole subject as a whole.

(3) The subject may be a general term taken in its full denotation, as _All apes are sagacious_; and in this case a Predication is made concerning the whole subject distributively; that is, of each and everything the subject stands for.

(4) Propositions whose subjects are abstract terms, though they may seem to be formally Singular, are really as to their meaning distributive Universals; since whatever is true of a quality is true of whatever thing has that quality so far as that quality is concerned. _Truth will prevail_ means that _All true propositions are accepted at last_ (by sheer force of being true, in spite of interests, prejudices, ignorance and indifference). To bear this in mind may make one cautious in the use of abstract terms.

In the above paragraphs a distinction is implied between Singular and Distributive Universals; but, technically, every term, whether subject or predicate, when taken in its full denotation (or universally), is said to be 'distributed,' although this word, in its ordinary sense, would be directly applicable only to general terms. In the above examples, then, 'Queen,' 'Black Watch,' 'apes,' and 'truth' are all distributed terms. Indeed, a simple definition of the Universal Proposition is 'one whose subject is distributed.'

A Particular Proposition is one that has a general term for its subject, whilst its predicate is not affirmed or denied of everything the subject denotes; in other words, it is one whose subject is not distributed: as _Some lions inhabit Africa_.

In ordinary discourse it is not always explicitly stated whether predication is universal or particular; it would be very natural to say _Lions inhabit Africa_, leaving it, as far as the words go, uncertain whether we mean _all_ or _some_ lions. Propositions whose quantity is thus left indefinite are technically called 'preindesignate,' their quantity not being stated or designated by any introductory expression; whilst propositions whose quantity is expressed, as _All foundling-hospitals have a high death-rate_, or _Some wine is made from grapes_, are said to be 'predesignate.' Now, the rule is that preindesignate propositions are, for logical purposes, to be treated as particular; since it is an obvious precaution of the science of proof, in any practical application, _not to go beyond the evidence_. Still, the rule may be relaxed if the universal quantity of a preindesignate proposition is well known or admitted, as in _Planets shine with reflected light_--understood of the planets of our solar system at the present time. Again, such a proposition as _Man is the paragon of animals_ is not a preindesignate, but an abstract proposition; the subject being elliptical for _Man according to his proper nature_; and the translation of it into a predesignate proposition is not _All men are paragons_; nor can _Some men_ be sufficient, since an abstract can only be adequately rendered by a distributed term; but we must say, _All men who approach the ideal_. Universal real propositions, true without qualification, are very scarce; and we often substitute for them _general_ propositions, saying perhaps--_generally, though not universally, S is P_. Such general propositions are, in strictness, particular; and the logical rules concerning universals cannot be applied to them without careful scrutiny of the facts.

The marks or predesignations of Quantity commonly used in Logic are: for Universals, _All_, _Any_, _Every_, _Whatever_ (in the negative _No_ or _No one_, see next Sec.); for Particulars, _Some_.

Now _Some_, technically used, does not mean _Some only,_ but _Some at least_ (it may be one, or more, or all). If it meant '_Some only_,' every particular proposition would be an exclusive exponible (chap. ii. Sec. 3); since _Only some men are wise_ implies that _Some men are not wise_. Besides, it may often happen in an investigation that all the instances we have observed come under a certain rule, though we do not yet feel justified in regarding the rule as universal; and this situation is exactly met by the expression _Some_ (_it may be all_).

The words _Many_, _Most_, _Few_ are generally interpreted to mean _Some_; but as _Most_ signifies that exceptions are known, and _Few_ that the exceptions are the more numerous, propositions thus predesignate are in fact exponibles, mounting to _Some are_ and _Some are not_. If to work with both forms be too cumbrous, so that we must choose one, apparently _Few are_ should be treated as _Some are not_. The scientific course to adopt with propositions predesignate by _Most_ or _Few_, is to collect statistics and determine the percentage; thus, _Few men are wise_--say 2 per cent.

The Quantity of a proposition, then, is usually determined entirely by the quantity of the subject, whether _all_ or _some_. Still, the quantity of the predicate is often an important consideration; and though in ordinary usage the predicate is seldom predesignate, Logicians agree that in every Negative Proposition (see Sec. 2) the predicate is 'distributed,' that is to say, is denied altogether of

the subject, and that this is involved in the form of denial. To say _Some men are not brave_, is to declare that the quality for which men may be called brave is not found in any of the _Some men_ referred to: and to say _No men are proof against flattery_, cuts off the being 'proof against flattery' entirely from the list of human attributes. On the other hand, every Affirmative Proposition is regarded as having an undistributed predicate; that is to say, its predicate is not affirmed exclusively of the subject. _Some men are wise_ does not mean that 'wise' cannot be predicated of any other beings; it is equivalent to _Some men are wise_ (_whoever else may be_). And _All elephants are sagacious_ does not limit sagacity to elephants: regarding 'sagacious' as possibly denoting many animals of many species that exhibit the quality, this proposition is equivalent to '_All elephants are_ some _sagacious animals_.' The affirmative predication of a quality does not imply exclusive possession of it as denial implies its complete absence; and, therefore, to regard the predicate of an affirmative proposition as distributed would be to go beyond the evidence and to take for granted what had never been alleged.

Some Logicians, seeing that the quantity of predicates, though not distinctly expressed, is recognised, and holding that it is the part of Logic "to make explicit in language whatever is implicit in thought," have proposed to exhibit the quantity of predicates by predesignation, thus: 'Some men are _some_ wise (beings)'; 'some men are not _any_ brave (beings)'; etc. This is called the Quantification of the Predicate, and leads to some modifications of Deductive Logic which will be referred to hereafter. (See Sec. 3; chap. vii. Sec. 4, and chap. viii. Sec. 3.)

Sec. 2. As to Quality, Propositions are either Affirmative or Negative. An Affirmative Proposition is, formally, one whose copula is affirmative (or, has no negative sign), as _S--is--P, All men--are--partial to themselves_. A Negative Proposition is one whose copula is negative (or, has a negative sign), as _S--is not--P, Some men--are not--proof against flattery_. When, indeed, a Negative Proposition is of Universal Quantity, it is stated thus: _No S is P, No men are proof against flattery_; but, in this case, the detachment of the negative sign from the copula and its association with the subject is merely an accident of our idiom; the proposition is the same as _All men--are not--proof against flattery_. It must be distinguished, therefore, from such an expression as _Not every man is proof against flattery_; for here the negative sign really restricts the subject; so that the meaning is--_Some men at most_ (it may be _none) are proof against flattery_; and thus the proposition is Particular, and is rendered--_Some men--are not--proof against flattery_.

When the negative sign is associated with the predicate, so as to make this an Infinite Term (chap. iv. Sec. 8), the proposition is called an Infinite Proposition, as _S is not-P_ (or _p), All men are--incapable of resisting flattery_, or _are--not-proof against flattery_.

Infinite propositions, when the copula is affirmative, are formally, themselves affirmative, although their force is chiefly negative; for, as the last example shows, the difference between an infinite and a negative proposition may depend upon a hyphen. It has been proposed, indeed, with a view to superficial simplification, to turn all Negatives into Infinites, and thus render all propositions Affirmative in Quality. But although every proposition both affirms and denies something according to the aspect in which you regard it (as _Snow is white_ denies that it is any other colour, and _Snow is not blue_ affirms that it is some other colour), yet there is a great difference between the definite affirmation of a genuine affirmative and the vague affirmation of a negative or infinite; so that materially an affirmative infinite is the same as a negative.

Generally Mill's remark is true, that affirmation and denial stand for distinctions of fact that cannot be got rid of by manipulation of words. Whether granite sinks in water, or not; whether the rook lives a hundred years, or not; whether a man has a hundred dollars in his pocket, or not; whether human bones have ever been found in Pliocene strata, or not; such alternatives require distinct forms of expression. At the same time, it may be granted that many facts admit of being stated with nearly equal propriety in either Quality, as _No man is proof against flattery_, or _All men are open to flattery_.

But whatever advantage there is in occasionally changing the Quality of a proposition may be gained by the process of Obversion (chap. vii. Sec. 5); whilst to use only one Quality would impair the elasticity of logical expression. It is a postulate of Logic that the negative sign may be transferred from the copula to the predicate, or from the predicate to the copula, without altering the sense of a proposition; and this is justified by the experience that not to have an attribute and to be without it are the same thing.

Sec. 3. A. I. E. O.--Combining the two kinds of Quantity, Universal and Particular, with the two kinds of Quality, Affirmative and Negative, we get four simple types of proposition, which it is usual to symbolise by the letters A. I. E. O., thus:

A. Universal Affirmative -- All S is P. I. Particular Affirmative -- Some S is P. E. Universal Negative -- No S is P. O. Particular Negative -- Some S is not P.

As an aid to the remembering of these symbols we may observe that A. and I. are the first two vowels in _affirmo_ and that E. and O. are the vowels in _nego_.

It must be acknowledged that these four kinds of proposition recognised by Formal Logic constitute a very meagre selection from the list of propositions actually used in judgment and reasoning.

Those Logicians who explicitly quantify the predicate obtain, in all, eight forms of proposition according to Quantity and Quality:

[Transcriber's Note: The Greek characters used in the original are represented below by the name of the character in square brackets.]

U. Toto-total Affirmative -- All X is all Y. A. Toto-partial Affirmative -- All X is some Y. Y. Parti-total Affirmative -- Some X is all Y. I. Parti-partial Affirmative -- Some X is some Y. E. Toto-total Negative -- No X is any Y. [eta]. Toto-partial Negative -- No X is some Y. O. Parti-total Negative -- Some X is not any Y. [omega]. Parti-partial Negative -- Some X is not some Y.

Here A. I. E. O. correspond with those similarly symbolised in the usual list, merely designating in the predicates the quantity which was formerly treated as implicit.

Sec. 4. As to Relation, propositions are either Categorical or Conditional. A Categorical Proposition is one in which the predicate is directly affirmed or denied of the subject without any limitation of time, place, or circumstance, extraneous to the subject, as _All men in England are secure of justice_; in which proposition, though there is a limitation of place ('in England'), it is included in the subject. Of this kind are nearly all the examples that have yet been given, according to the form _S is P_.

A Conditional Proposition is so called because the predication is made under some limitation or condition not included in the subject, as _If a man live in England, he is secure of justice_. Here the limitation 'living in England' is put into a conditional sentence extraneous to the subject, 'he,' representing any man.

Conditional propositions, again, are of two kinds--Hypothetical and Disjunctive. Hypothetical propositions are those that are limited by an explicit conditional sentence, as above, or thus: _If Joe Smith was a prophet, his followers have been unjustly persecuted_. Or in symbols thus:

If A is, B is; If A is B, A is C; If A is B, C is D.

Disjunctive propositions are those in which the condition under which predication is made is not explicit but only implied under the disguise of an alternative proposition, as _Joe Smith was either a prophet or an impostor_. Here there is no direct predication concerning Joe Smith, but only a predication of one of the alternatives conditionally on the other being denied, as, _If Joe Smith was not a prophet he was an impostor_; or, _If he was not an impostor, he was a prophet_. Symbolically, Disjunctives may be represented thus:

A is either B or C, Either A is B or C is D.

Formally, every Conditional may be expressed as a Categorical. For our last example shows how a Disjunctive may be reduced to two Hypotheticals (of which one is redundant, being the contrapositive of the other; see chap. vii. Sec. 10). And a Hypothetical is reducible to a Categorical thus: _If the sky is clear, the night is cold_ may be read--_The case of the sky being clear is a case of the night being cold_; and this, though a clumsy plan, is sometimes convenient. It would be better to say _The sky being clear is a sign of the night being cold_, or a condition of it. For, as Mill says, the essence of a Hypothetical is to state that one clause of it (the indicative) may be inferred from the other (the conditional). Similarly, we might write: _Proof of Joe Smith's not being a prophet is a proof of his being an impostor_.

This turning of Conditionals into Categoricals is called a Change of Relation; and the process may be reversed: _All the wise are virtuous_ may be written, _If any man is wise he is virtuous_; or, again, _Either a man is not-wise or he is virtuous_. But the categorical form is usually the simplest.

If, then, as substitutes for the corresponding conditionals, categoricals are formally adequate, though sometimes inelegant, it may be urged that Logic has nothing to do with elegance; or that, at any rate, the chief elegance of science is economy, and that therefore, for scientific purposes, whatever we may write further about conditionals must be an ugly excrescence. The scientific purpose of Logic is to assign the conditions of proof. Can we, then, in the conditional form prove anything that cannot be proved in

the categorical? Or does a conditional require to be itself proved by any method not applicable to the Categorical? If not, why go on with the discussion of Conditionals? For all laws of Nature, however stated, are essentially categorical. 'If a straight line falls on another straight line, the adjacent angles are together equal to two right angles'; 'If a body is unsupported, it falls'; 'If population increases, rents tend to rise': here 'if' means 'whenever' or 'all cases in which'; for to raise a doubt whether a straight line is ever conceived to fall upon another, whether bodies are ever unsupported, or population ever increases, is a superfluity of scepticism; and plainly the hypothetical form has nothing to do with the proof of such propositions, nor with inference from them.

Still, the disjunctive form is necessary in setting out the relation of contradictory terms, and in stating a Division (chap. xxi.), whether formal (_as A is B or not-B_) or material (as _Cats are white, or black, or tortoiseshell, or tabby_). And in some cases the hypothetical form is useful. One of these occurs where it is important to draw attention to the condition, as something doubtful or especially requiring examination. _If there is a resisting medium in space, the earth will fall into the sun; If the Corn Laws are to be re-enacted, we had better sell railways and buy land_: here the hypothetical form draws attention to the questions whether there is a resisting medium in space, whether the Corn Laws are likely to be re-enacted; but as to methods of inference and proof, the hypothetical form has nothing to do with them. The propositions predicate causation: _A resisting medium in space is a condition of the earth's falling into the sun; A Corn Law is a condition of the rise of rents, and of the fall of railway profits_.

A second case in which the hypothetical is a specially appropriate form of statement occurs where a proposition relates to a particular matter and to future time, as _If there be a storm to-morrow, we shall miss our picnic_. Such cases are of very slight logical interest. It is as exercises in formal thinking that hypotheticals are of most value; inasmuch as many people find them more difficult than categoricals to manipulate.

In discussing Conditional Propositions, the conditional sentence of a Hypothetical, or the first alternative of a Disjunctive, is called the Antecedent; the indicative sentence of a Hypothetical, or the second alternative of a Disjunctive, is called the Consequent.

Hypotheticals, like Categoricals, have been classed according to Quantity and Quality. Premising that the quantity of a Hypothetical depends on the quantity of its Antecedent (which determines its limitation), whilst its quality depends on the quality of its consequent (which makes the predication), we may exhibit four forms:

A. _If A is B, C is D;_ I. _Sometimes when A is B, C is D;_ E. _If A is B, C is not D;_ O. _Sometimes when A is B, C is not D._

But I. and O. are rarely used.

As for Disjunctives, it is easy to distinguish the two quantities thus:

A. _Either A is B, or C is D;_ I. _Sometimes either A is B or C is D._

But I. is rarely used. The distinction of quality, however, cannot be made: there are no true negative forms; for if we write--

Neither is A B, nor C D,

there is here no alternative predication, but only an Exponible equivalent to _No A is B, and No C is D_. And if we write--

Either A is not B, or C is not D,

this is affirmative as to the alternation, and is for all methods of treatment equivalent to A.

Logicians are divided in opinion as to the interpretation of the conjunction 'either, or'; some holding that it means 'not both,' others that it means 'it may be both.' Grammatical usage, upon which the question is sometimes argued, does not seem to be established in favour of either view. If we say _A man so precise in his walk and conversation is either a saint or a consummate hypocrite_; or, again, _One who is happy in a solitary life is either more or less than man_; we cannot in such cases mean that the subject may be both. On the other hand, if it be said that _the author of 'A Tale of a Tub' is either a misanthrope or a dyspeptic_, the alternatives are not incompatible. Or, again, given that _X. is a lunatic, or a lover, or a poet_, the three predicates have much congruity.

It has been urged that in Logic, language should be made as exact and definite as possible, and that this requires the exclusive interpretation 'not both.' But it seems a better argument, that Logic (1) should be able to express all meanings, and (2), as the science of evidence, must not assume more than is given; to be on the safe side, it must in doubtful cases assume the least, just as it generally assumes a preindesignate term to be of particular quantity; and, therefore 'either, or' means 'one, or the other, or both.'

However, when both the alternative propositions have the same subject, as _Either A is B, or A is C_, if the two predicates are contrary or contradictory terms (as 'saint' and 'hypocrite,' or 'saint' and 'not-saint'), they cannot in their nature be predicable in the same way of the same subject; and, therefore, in such a case 'either, or' means one or the other, but not both in the same relation. Hence it seems necessary to admit that the conjunction 'either, or' may sometimes require one interpretation, sometimes the other; and the rule is that it implies the further possibility 'or both,' except when both alternatives have the same subject whilst the predicates are contrary or contradictory terms.

If, then, the disjunctive _A is either B or C_ (_B_ and _C_ being contraries) implies that both alternatives cannot be true, it can only be adequately rendered in hypotheticals by the two forms--(1) _If A is B, it is not C_, and (2)_If A is not B, it is C_. But if the disjunctive _A is either B or C_ (_B_ and _C_ not being contraries) implies that both may be true, it will be adequately translated into a hypothetical by the single form, _If A is not B, it is C_. We cannot translate it into--_If A is B, it is not C_, for, by our supposition, if '_A is B_' is true, it does not follow that '_A is C_' must be false.

Logicians are also divided in opinion as to the function of the hypothetical form. Some think it expresses doubt; for the consequent depends on the antecedent, and the antecedent, introduced by 'if,' may or may not be realised, as in _If the sky is clear, the night is cold_: whether the sky is, or is not, clear being supposed to be uncertain. And we have seen that some hypothetical propositions seem designed to draw attention to such uncertainty, as--_If there is a resisting medium in space_, etc. But other Logicians lay stress upon the connection of the clauses as the important matter: the statement is, they say, that the consequent may be inferred from the antecedent. Some even declare that it is given as a necessary inference; and on this ground Sigwart rejects particular hypotheticals, such as _Sometimes when A is B, C is D_; for if it happens only sometimes the connexion cannot be necessary. Indeed, it cannot even be probably inferred without further grounds. But this is also true whenever the antecedent and consequent are concerned with different matter. For example, _If the soul is simple, it is indestructible_. How do you know that? Because _Every simple substance is indestructible_. Without this further ground there can be no inference. The fact is that conditional forms often cover assertions that are not true complex propositions but a sort of euthymemes (chap. xi. Sec. 2), arguments abbreviated and rhetorically disguised. Thus: _If patience is a virtue there are painful virtues_--an example from Dr. Keynes. Expanding this we have--

Patience is painful; Patience is a virtue: .'. Some virtue is painful.

And then we see the equivocation of the inference; for though patience be painful _to learn_, it is not painful _as a virtue_ to the patient man.

The hypothetical, '_If Plato was not mistaken poets are dangerous citizens_,' may be considered as an argument against the laureateship, and may be expanded (informally) thus: 'All Plato's opinions deserve respect; one of them was that poets are bad citizens; therefore it behoves us to be chary of encouraging poetry.' Or take this disjunctive, '_Either Bacon wrote the works ascribed to Shakespeare, or there were two men of the highest genius in the same age and country_.' This means that it is not likely there should be two such men, that we are sure of Bacon, and therefore ought to give him all the glory. Now, if it is the part of Logic 'to make explicit in language all that is implicit in thought,' or to put arguments into the form in which they can best be examined, such propositions as the above ought to be analysed in the way suggested, and confirmed or refuted according to their real intention.

We may conclude that no single function can be assigned to all hypothetical propositions: each must be treated according to its own meaning in its own context.

Sec. 5. As to Modality, propositions are divided into Pure and Modal. A Modal proposition is one in which the predicate is affirmed or denied, not simply but _cum modo_, with a qualification. And some Logicians have considered any adverb occurring in the predicate, or any sign of past or future tense, enough to constitute a modal: as 'Petroleum is _dangerously_ inflammable'; 'English _will be_ the universal language.' But far the most important kind of modality, and the only one we need consider, is that which is signified by some qualification of the predicate as to the degree of certainty with which it is affirmed or denied. Thus, 'The bite of the cobra is _probably_ mortal,' is called a Contingent or Problematic Modal: 'Water is _certainly_ composed of oxygen and hydrogen' is an Assertory or Certain Modal: 'Two straight lines _cannot_ enclose a space' is a Necessary or Apodeictic Modal (the opposite being inconceivable). Propositions not thus qualified are called Pure.

Modal propositions have had a long and eventful history, but they have not been found tractable by the resources of ordinary Logic, and are now generally neglected by the authors of text-books. No doubt such propositions are the commonest in ordinary

discourse, and in some rough way we combine them and draw inferences from them. It is understood that a combination of assertory or of apodeictic premises may warrant an assertory or an apodeictic conclusion; but that if we combine either of these with a problematic premise our conclusion becomes problematic; whilst the combination of two problematic premises gives a conclusion less certain than either. But if we ask 'How much less certain?' there is no answer. That the modality of a conclusion follows the less certain of the premises combined, is inadequate for scientific guidance; so that, as Deductive Logic can get no farther than this, it has abandoned the discussion of Modals. To endeavour to determine the degree of certainty attaching to a problematic judgment is not, however, beyond the reach of Induction, by analysing circumstantial evidence, or by collecting statistics with regard to it. Thus, instead of 'The cobra's bite is _probably_ fatal,' we might find that it is fatal 80 times in 100. Then, if we know that of those who go to India 3 in 1000 are bitten, we can calculate what the chances are that any one going to India will die of a cobra's bite (chap. xx.).

Sec. 6. Verbal and Real Propositions.--Another important division of propositions turns upon the relation of the predicate to the subject in respect of their connotations. We saw, when discussing Relative Terms, that the connotation of one term often implies that of another; sometimes reciprocally, like 'master' and 'slave'; or by inclusion, like species and genus; or by exclusion, like contraries and contradictories. When terms so related appear as subject and predicate of the same proposition, the result is often tautology--e.g., _The master has authority over his slave; A horse is an animal; Red is not blue; British is not foreign_. Whoever knows the meaning of 'master,' 'horse,' 'red,' 'British,' learns nothing from these propositions. Hence they are called Verbal propositions, as only expounding the sense of words, or as if they were propositions only by satisfying the forms of language, not by fulfilling the function of propositions in conveying a knowledge of facts. They are also called 'Analytic' and 'Explicative,' when they separate and disengage the elements of the connotation of the subject. Doubtless, such propositions may be useful to one who does not know the language; and Definitions, which are verbal propositions whose predicates analyse the whole connotations of their subjects, are indispensable instruments of science (see chap. xxii.).

Of course, hypothetical propositions may also be verbal, as _If the soul be material it is extended_; for 'extension' is connoted by 'matter'; and, therefore, the corresponding disjunctive is verbal--_Either the soul is not material, or it is extended_. But a true divisional disjunctive can never be verbal (chap. xxi. Sec. 4, rule 1).

On the other hand, when there is no such direct relation between subject and predicate that their connotations imply one another, but the predicate connotes something that cannot be learnt from the connotation of the subject, there is no longer tautology, but an enlargement of meaning--e.g., _Masters are degraded by their slaves; The horse is the noblest animal; Red is the favourite colour of the British army; If the soul is simple, it is indestructible_. Such propositions are called Real, Synthetic, or Ampliative, because they are propositions for which a mere understanding of their subjects would be no substitute, since the predicate adds a meaning of its own concerning matter of fact.

To any one who understands the language, a verbal proposition can never be an inference or conclusion from evidence; nor can a verbal proposition ever furnish grounds for an inference, except as to the meaning of words. The subject of real and verbal propositions will inevitably recur in the chapters on Definition; but tautologies are such common blemishes in composition, and such frequent pitfalls in argument, that attention cannot be drawn to them too early or too often.

CHAPTER VI

CONDITIONS OF IMMEDIATE INFERENCE

Sec. 1. The word Inference is used in two different senses, which are often confused but should be carefully distinguished. In the first sense, it means a process of thought or reasoning by which the mind passes from facts or statements presented, to some opinion or expectation. The data may be very vague and slight, prompting no more than a guess or surmise; as when we look up at the sky and form some expectation about the weather, or from the trick of a man's face entertain some prejudice as to his character. Or the data may be important and strongly significant, like the footprint that frightened Crusoe into thinking of cannibals, or as when news of war makes the city expect that Consols will fall. These are examples of the act of inferring, or of inference as a process; and with inference in this sense Logic has nothing to do; it belongs to Psychology to explain how it is that our minds pass from one perception or thought to another thought, and how we come to conjecture, conclude and believe (_cf._ chap. i. Sec. 6).

In the second sense, 'inference' means not this process of guessing or opining, but the result of it; the surmise, opinion, or belief when formed; in a word, the conclusion: and it is in this sense that Inference is treated of in Logic. The subject-matter of Logic is an

inference, judgment or conclusion concerning facts, embodied in a proposition, which is to be examined in relation to the evidence that may be adduced for it, in order to determine whether, or how far, the evidence amounts to proof. Logic is the science of Reasoning in the sense in which 'reasoning' means giving reasons, for it shows what sort of reasons are good. Whilst Psychology explains how the mind goes forward from data to conclusions, Logic takes a conclusion and goes back to the data, inquiring whether those data, together with any other evidence (facts or principles) that can be collected, are of a nature to warrant the conclusion. If we think that the night will be stormy, that John Doe is of an amiable disposition, that water expands in freezing, or that one means to national prosperity is popular education, and wish to know whether we have evidence sufficient to justify us in holding these opinions, Logic can tell us what form the evidence should assume in order to be conclusive. What _form_ the evidence should assume: Logic cannot tell us what kinds of fact are proper evidence in any of these cases; that is a question for the man of special experience in life, or in science, or in business. But whatever facts constitute the evidence, they must, in order to prove the point, admit of being stated in conformity with certain principles or conditions; and of these principles or conditions Logic is the science. It deals, then, not with the subjective process of inferring, but with the objective grounds that justify or discredit the inference.

Sec. 2. Inferences, in the Logical sense, are divided into two great classes, the Immediate and the Mediate, according to the character of the evidence offered in proof of them. Strictly, to speak of inferences, in the sense of conclusions, as immediate or mediate, is an abuse of language, derived from times before the distinction between inference as process and inference as result was generally felt. No doubt we ought rather to speak of Immediate and Mediate Evidence; but it is of little use to attempt to alter the traditional expressions of the science.

An Immediate Inference, then, is one that depends for its proof upon only one other proposition, which has the same, or more extensive, terms (or matter). Thus that _one means to national prosperity is popular education_ is an immediate inference, if the evidence for it is no more than the admission that _popular education is a means to national prosperity:_ Similarly, it is an immediate inference that _Some authors are vain_, if it be granted that _All authors are vain_.

An Immediate Inference may seem to be little else than a verbal transformation; some Logicians dispute its claims to be called an inference at all, on the ground that it is identical with the pretended evidence. If we attend to the meaning, say they, an immediate inference does not really express any new judgment; the fact expressed by it is either the same as its evidence, or is even less significant. If from _No men are gods_ we prove that _No gods are men_, this is nugatory; if we prove from it that _Some men are not gods_, this is to emasculate the sense, to waste valuable information, to lose the commanding sweep of our universal proposition.

Still, in Logic, it is often found that an immediate inference expresses our knowledge in a more convenient form than that of the evidentiary proposition, as will appear in the chapter on Syllogisms and elsewhere. And by transforming an universal into a particular proposition, as _No men are gods_, therefore, _Some men are not gods_,--we get a statement which, though weaker, is far more easily proved; since a single instance suffices. Moreover, by drawing all possible immediate inferences from a given proposition, we see it in all its aspects, and learn all that is implied in it.

A Mediate Inference, on the other hand, depends for its evidence upon a plurality of other propositions (two or more) which are connected together on logical principles. If we argue--

No men are gods; Alexander the Great is a man; .'. Alexander the Great is not a god:

this is a Mediate Inference. The evidence consists of two propositions connected by the term 'man,' which is common to both (a Middle Term), mediating between 'gods' and 'Alexander.' Mediate Inferences comprise Syllogisms with their developments, and Inductions; and to discuss them further at present would be to anticipate future chapters. We must now deal with the principles or conditions on which Immediate Inferences are valid: commonly called the "Laws of Thought."

Sec. 3. The Laws of Thought are conditions of the logical statement and criticism of all sorts of evidence; but as to Immediate Inference, they may be regarded as the only conditions it need satisfy. They are often expressed thus: (1) The principle of Identity--'_Whatever is, is_'; (2) The principle of Contradiction--'_It is impossible for the same thing to be and not be_'; (3) The principle of Excluded Middle--'_Anything must either be or not be_.' These principles are manifestly not 'laws' of thought in the sense in which 'law' is used in Psychology; they do not profess to describe the actual mental processes that take place in judgment or reasoning, as the 'laws of association of ideas' account for memory and recollection. They are not natural laws of thought; but, in relation to thought, can only be regarded as laws when stated as precepts, the observance of which (consciously or not) is

necessary to clear and consistent thinking: e.g., Never assume that the same thing can both be and not be.

However, treating Logic as the science of thought only as embodied in propositions, in respect of which evidence is to be adduced, or which are to be used as evidence of other propositions, the above laws or principles must be restated as the conditions of consistent argument in such terms as to be directly applicable to propositions. It was shown in the chapter on the connotation of terms, that terms are assumed by Logicians to be capable of definite meaning, and of being used univocally in the same context; if, or in so far as, this is not the case, we cannot understand one another's reasons nor even pursue in solitary meditation any coherent train of argument. We saw, too, that the meanings of terms were related to one another: some being full correlatives; others partially inclusive one of another, as species of genus; others mutually incompatible, as contraries; or alternatively predicable, as contradictories. We now assume that propositions are capable of definite meaning according to the meaning of their component terms and of the relation between them; that the meaning, the fact asserted or denied, is what we are really concerned to prove or disprove; that a mere change in the words that constitute our terms, or of construction, does not affect the truth of a proposition as long as the meaning is not altered, or (rather) as long as no fresh meaning is introduced; and that if the meaning of any proposition is true, any other proposition that denies it is false. This postulate is plainly necessary to consistency of statement and discourse; and consistency is necessary, if our thought or speech is to correspond with the unity and coherence of Nature and experience; and the Laws of Thought or Conditions of Immediate Inference are an analysis of this postulate.

Sec. 4. The principle of Identity is usually written symbolically thus: _A is A; not-A is not-A_. It assumes that there is something that may be represented by a term; and it requires that, in any discussion, _every relevant term, once used in a definite sense, shall keep that meaning throughout_. Socrates in his father's workshop, at the battle of Delium, and in prison, is assumed to be the same man denotable by the same name; and similarly, 'elephant,' or 'justice,' or 'fairy,' in the same context, is to be understood of the same thing under the same _suppositio_.

But, further, it is assumed that of a given term another term may be predicated again and again in the same sense under the same conditions; that is, we may speak of the identity of meaning in a proposition as well as in a term. To symbolise this we ought to alter the usual formula for Identity and write it thus: _If B is A, B is A; if B is not-A, B is not-A_. If Socrates is wise, he is wise; if fairies frequent the moonlight, they do; if Justice is not of this world, it is not. _Whatever affirmation or denial we make concerning any subject, we are bound to adhere to it for the purposes of the current argument or investigation._ Of course, if our assertion turns out to be false, we must not adhere to it; but then we must repudiate all that we formerly deduced from it.

Again, _whatever is true or false in one form of words is true or false in any other_: this is undeniable, for the important thing is identity of meaning; but in Formal Logic it is not very convenient. If Socrates is wise, is it an identity to say 'Therefore the master of Plato is wise'; or, further that he 'takes enlightened views of life'? If _Every man is fallible_, is it an identical proposition that _Every man is liable to error_? It seems pedantic to demand a separate proposition that _Fallible is liable to error_. But, on the other hand, the insidious substitution of one term for another speciously identical, is a chief occasion of fallacy. How if we go on to argue: therefore, _Every man is apt to blunder, prone to confusion of thought, inured to self-contradiction_? Practically, the substitution of identities must be left to candour and good-sense; and may they increase among us. Formal Logic is, no doubt, safest with symbols; should, perhaps, content itself with A and B; or, at least, hardly venture beyond Y and Z.

Sec. 5. The principle of Contradiction is usually written symbolically, thus: _A is not not-A_. But, since this formula seems to be adapted to a single term, whereas we want one that is applicable to propositions, it may be better to write it thus: _B is not both A and not-A_. That is to say: _if any term may be affirmed of a subject, the contradictory term may, in the same relation, be denied of it_. A leaf that is green on one side of it may be not-green on the other; but it is not both green and not-green on the same surface, at the same time, and in the same light. If a stick is straight, it is false that it is at the same time not-straight: having granted that two angles are equal, we must deny that they are unequal.

But is it necessarily false that the stick is 'crooked'; must we deny that either angle is 'greater or less' than the other? How far is it permissible to substitute any other term for the formal contradictory? Clearly, the principle of Contradiction takes for granted the principle of Identity, and is subject to the same difficulties in its practical application. As a matter of fact and common sense, if we affirm any term of a Subject, we are bound to deny of that Subject, in the same relation, not only the contradictory but all synonyms for this, and also all contraries and opposites; which, of course, are included in the contradictory. But who shall determine what these are? Without an authoritative Logical Dictionary to refer to, where all contradictories, synonyms, and contraries may be found on record, Formal Logic will hardly sanction the free play of common sense.

The principle of Excluded Middle may be written: _B is either A or not-A_; that is, _if any term be denied of a subject, the contradictory term may, in the same relation, be affirmed_. Of course, we may deny that a leaf is green on one side without being bound to affirm that it is not-green on the other. But in the same relation a leaf is either green or not-green; at the same time, a stick is either bent or not-bent. If we deny that A is greater than B, we must affirm that it is not-greater than B.

Whilst, then, the principle of Contradiction (that 'of contradictory predicates, one being affirmed, the other is denied ') might seem to leave open a third or middle course, the denying of both contradictories, the principle of Excluded Middle derives its name from the excluding of this middle course, by declaring that the one or the other must be affirmed. Hence the principle of Excluded Middle does not hold good of mere contrary terms. If we deny that a leaf is green, we are not bound to affirm it to be yellow; for it may be red; and then we may deny both contraries, yellow and green. In fact, two contraries do not between them cover the whole predicable area, but contradictories do: the form of their expression is such that (within the _suppositio_) each includes all that the other excludes; so that the subject (if brought within the _suppositio_) must fall under the one or the other. It may seem absurd to say that Mont Blanc is either wise or not-wise; but how comes any mind so ill-organised as to introduce Mont Blanc into this strange company? Being there, however, the principle is inexorable: Mont Blanc is not-wise.

In fact, the principles of Contradiction and Excluded Middle are inseparable; they are implicit in all distinct experience, and may be regarded as indicating the two aspects of Negation. The principle of Contradiction says: _B is not both A and not-A_, as if _not-A_ might be nothing at all; this is abstract negation. But the principle of Excluded Middle says: _Granting that B is not A, it is still something_--namely, _not-A_; thus bringing us back to the concrete experience of a continuum in which the absence of one thing implies the presence of something else. Symbolically: to deny that B is A is to affirm that B is not A, and this only differs by a hyphen from B is not-A.

These principles, which were necessarily to some extent anticipated in chap. iv. Sec. 7, the next chapter will further illustrate.

Sec. 6. But first we must draw attention to a maxim (also already mentioned), which is strictly applicable to Immediate Inferences, though (as we shall see) in other kinds of proof it may be only a formal condition: this is the general caution _not to go beyond the evidence_. An immediate inference ought to contain nothing that is not contained (or formally implied) in the proposition by which it is proved. With respect to quantity in denotation, this caution is embodied in the rule 'not to distribute any term that is not given distributed.' Thus, if there is a predication concerning 'Some S,' or 'Some men,' as in the forms I. and O., we cannot infer anything concerning 'All S.' or 'All men'; and, as we have seen, if a term is given us preindesignate, we are generally to take it as of particular quantity. Similarly, in the case of affirmative propositions, we saw that this rule requires us to assume that their predicates are undistributed.

As to the grounds of this maxim, not to go beyond the evidence, not to distribute a term that is given as undistributed, it is one of the things so plain that to try to justify is only to obscure them. Still, we must here state explicitly what Formal Logic assumes to be contained or implied in the evidence afforded by any proposition, such as 'All S is P.' If we remember that in chap. iv. Sec. 7, it was assumed that every term may have a contradictory; and if we bear in mind the principles of Contradiction and Excluded Middle, it will appear that such a proposition as 'All S is P' tells us something not only about the relations of 'S' and 'P,' but also of their relations to 'not-S' and 'not-P'; as, for example, that 'S is not not-P,' and that 'not-P is not-S.' It will be shown in the next chapter how Logicians have developed these implications in series of Immediate Inferences.

If it be asked whether it is true that every term, itself significant, has a significant contradictory, and not merely a formal contradictory, generated by force of the word 'not,' it is difficult to give any better answer than was indicated in Sec.Sec. 3-5, without venturing further into Metaphysics. I shall merely say, therefore, that, granting that some such term as 'Universe' or 'Being' may have no significant contradictory, if it stand for 'whatever can be perceived or thought of'; yet every term that stands for less than 'Universe' or 'Being' has, of course, a contradictory which denotes the rest of the universe. And since every argument or train of thought is carried on within a special 'universe of discourse,' or under a certain _suppositio_, we may say that _within the given suppositio every term has a contradictory_, and that every predication concerning a term implies some predication concerning its contradictory. But the name of the _suppositio_ itself has no contradictory, except with reference to a wider and inclusive _suppositio_.

The difficulty of actual reasoning, not with symbols, but about matters of fact, does not arise from the principles of Logic, but sometimes from the obscurity or complexity of the facts, sometimes from the ambiguity or clumsiness of language, sometimes from the deficiency of our own minds in penetration, tenacity and lucidity. One must do one's best to study the facts, and not be too

easily discouraged.

CHAPTER VII

IMMEDIATE INFERENCES

Sec. 1. Under the general title of Immediate Inference Logicians discuss three subjects, namely, Opposition, Conversion, and Obversion; to which some writers add other forms, such as Whole and Part in Connotation, Contraposition, Inversion, etc. Of Opposition, again, all recognise four modes: Subalternation, Contradiction, Contrariety and Sub-contrariety. The only peculiarities of the exposition upon which we are now entering are, that it follows the lead of the three Laws of Thought, taking first those modes of Immediate Inference in which Identity is most important, then those which plainly involve Contradiction and Excluded Middle; and that this method results in separating the modes of Opposition, connecting Subalternation with Conversion, and the other modes with Obversion. To make up for this departure from usage, the four modes of Opposition will be brought together again in Sec. 9.

Sec. 2. Subalternation.--Opposition being the relation of propositions that have the same matter and differ only in form (as A., E., I., O.), propositions of the forms A. and I. are said to be Subalterns in relation to one another, and so are E. and O.; the universal of each quality being distinguished as 'subalternans,' and the particular as 'subalternate.'

It follows from the principle of Identity that, the matter of the propositions being the same, if A. is true I. is true, and that if E. is true O. is true; for A. and E. predicate something of _All S_ or _All men_; and since I. and O. make the same predication of _Some S_ or _Some men_, the sense of these particular propositions has already been predicated in A. or E. If _All S is P, Some S is P_; if _No S is P, Some S is not P_; or, if _All men are fond of laughing, Some men are_; if _No men are exempt from ridicule, Some men are not_.

Similarly, if I. is false A. is false; if O. is false E. is false. If we deny any predication about _Some S_, we must deny it of _All S_; since in denying it of _Some_, we have denied it of at least part of _All_; and whatever is false in one form of words is false in any other.

On the other hand, if I. is true, we do not know that A. is; nor if O. is true, that E. is; for to infer from _Some_ to _All_ would be going beyond the evidence. We shall see in discussing Induction that the great problem of that part of Logic is, to determine the conditions under which we may in reality transcend this rule and infer from _Some_ to _All_; though even there it will appear that, formally, the rule is observed. For the present it is enough that I. is an immediate inference from A., and O. from E.; but that A. is not an immediate inference from I., nor E. from O.

Sec. 3. Connotative Subalternation.--We have seen (chap. iv. Sec. 6) that if the connotation of one term is only part of another's its denotation is greater and includes that other's. Hence genus and species stand in subaltern relation, and whatever is true of the genus is true of the species: If _All animal life is dependent on vegetation, All human life is dependent on vegetation_. On the other hand, whatever is not true of the species or narrower term, cannot be true of the whole genus: If it is false that '_All human life is happy_,' it is false that '_All animal life is happy_.'

Similar inferences may be drawn from the subaltern relation of predicates; affirming the species we affirm the genus. To take Mill's example, if _Socrates is a man, Socrates is a living creature_. On the other hand, denying the genus we deny the species: if _Socrates is not vicious, Socrates is not drunken_.

Such cases as these are recognised by Mill and Bain as immediate inferences under the principle of Identity. But some Logicians might treat them as imperfect syllogisms, requiring another premise to legitimate the conclusion, thus:

All animal life is dependent on vegetation; All human life is animal life; .'. All human life is dependent on vegetation.

Or again:

All men are living creatures; Socrates is a man; .'. Socrates is a living creature.

The decision of this issue turns upon the question (_cf._ chap. vi. Sec. 3) how far a Logician is entitled to assume that the terms he uses are understood, and that the identities involved in their meanings will be recognised. And to this question, for the sake of consistency, one of two answers is required; failing which, there remains the rule of thumb. First, it may be held that no terms are understood except those that are defined in expounding the science, such as 'genus' and 'species,' 'connotation' and 'denotation.'

But very few Logicians observe this limitation; few would hesitate to substitute 'not wise' for 'foolish.' Yet by what right? Malvolio being foolish, to prove that he is not-wise, we may construct the following syllogism:

Foolish is not-wise; Malvolio is foolish; .'. Malvolio is not-wise.

Is this necessary? Why not?

Secondly, it may be held that all terms may be assumed as understood unless a definition is challenged. This principle will justify the substitution of 'not-wise' for 'foolish'; but it will also legitimate the above cases (concerning 'human life' and 'Socrates') as immediate inferences, with innumerable others that might be based upon the doctrine of relative terms: for example, _The hunter missed his aim_: therefore, _The prey escaped_. And from this principle it will further follow that all apparent syllogisms, having one premise a verbal proposition, are immediate inferences (_cf._ chap. ix. Sec. 4).

Closely connected with such cases as the above are those mentioned by Archbishop Thomson as "Immediate Inferences by added Determinants" (_Laws of Thought_, Sec. 87). He takes the case: '_A negro is a fellow-creature_: therefore, _A negro in suffering is a fellow-creature in suffering_.' This rests upon the principle that to increase the connotations of two terms by the same attribute or determinant does not affect the relationship of their denotations, since it must equally diminish (if at all) the denotations of both classes, by excluding the same individuals, if any want the given attribute. But this principle is true only when the added attribute is not merely the same verbally, but has the same significance in qualifying both terms. We cannot argue _A mouse is an animal_; therefore, _A large mouse is a large animal_; for 'large' is an attribute relative to the normal magnitude of the thing described.

Sec. 4. Conversion is Immediate Inference by transposing the terms of a given proposition without altering its quality. If the quantity is also unaltered, the inference is called 'Simple Conversion'; but if the quantity is changed from universal to particular, it is called 'Conversion by limitation' or '_per accidens._' The given proposition is called the 'convertend'; that which is derived from it, the 'converse.'

Departing from the usual order of exposition, I have taken up Conversion next to Subalternation, because it is generally thought to rest upon the principle of Identity, and because it seems to be a good method to exhaust the forms that come only under Identity before going on to those that involve Contradiction and Excluded Middle. Some, indeed, dispute the claims of Conversion to illustrate the principle of Identity; and if the sufficient statement of that principle be 'A is A,' it may be a question how Conversion or any other mode of inference can be referred to it. But if we state it as above (chap. vi. Sec. 3), that whatever is true in one form of words is true in any other, there is no difficulty in applying it to Conversion.

Thus, to take the simple conversion of I.,

Some S is P; .'. Some P is S. _Some poets are business-like; .'. Some business-like men are poets._

Here the convertend and the converse say the same thing, and this is true if that is.

We have, then, two cases of simple conversion: of I. (as above) and of E. For E.:

_No S is P; .'. No P is S._ _No ruminants are carnivores; .'. No carnivores are ruminants._

In converting I., the predicate (P) when taken as the new subject, being preindesignate, is treated as particular; and in converting E., the predicate (P), when taken as the new subject, is treated as universal, according to the rule in chap. v. Sec. 1.

A. is the one case of conversion by limitation:

All S is P; .'. Some P is S.

All cats are grey in the dark; .'. Some things grey in the dark are cats.

The predicate is treated as particular, when taking it for the new subject, according to the rule not to go beyond the evidence. To infer that _All things grey in the dark are cats_ would be palpably absurd; yet no error of reasoning is commoner than the simple conversion of A. The validity of conversion by limitation may be shown thus: if, _All S is P_, then, by subalternation, _Some S is P_, and therefore, by simple conversion, _Some P is S_.

O. cannot be truly converted. If we take the proposition: _Some S is not P_, to convert this into _No P is S_, or _Some P is not S_, would break the rule in chap. vi. Sec. 6; since _S,_ undistributed in the convertend, would be distributed in the converse. If we are

told that _Some men are not cooks_, we cannot infer that _Some cooks are not men_. This would be to assume that '_Some men_' are identical with '_All men_.'

By quantifying the predicate, indeed, we may convert O. simply, thus:

Some men are not cooks .'. _No cooks are some men._

And the same plan has some advantage in converting A.; for by the usual method _per accidens_, the converse of A. being I., if we convert this again it is still I., and therefore means less than our original convertend. Thus:

All S is P .'. Some P is S .'. Some S is P.

Such knowledge, as that _All S_ (the whole of it) _is P_, is too precious a thing to be squandered in pure Logic; and it may be preserved by quantifying the predicate; for if we convert A. to Y., thus--

All S is P .'. Some P is all S--

we may reconvert Y. to A. without any loss of meaning. It is the chief use of quantifying the predicate that, thereby, every proposition is capable of simple conversion.

The conversion of propositions in which the relation of terms is inadequately expressed (see chap. ii., Sec. 2) by the ordinary copula (_is_ or _is not_) needs a special rule. To argue thus--

A is followed by B .'. _Something followed by B is A_--

would be clumsy formalism. We usually say, and we ought to say--

A is followed by B .'. _B follows A_ (or _is preceded by A_).

Now, any relation between two terms may be viewed from either side--_A: B_ or _B: A_. It is in both cases the same fact; but, with the altered point of view, it may present a different character. For example, in the Immediate Inference--_A > B_ .'. _B < A_--a diminishing turns into an increasing ratio, whilst the fact predicated remains the same. Given, then, a relation between two terms as viewed from one to the other, the same relation viewed from the other to the one may be called the Reciprocal. In the cases of Equality, Co-existence and Simultaneity, the given relation and its reciprocal are not only the same fact, but they also have the same character: in the cases of Greater and Less and Sequence, the character alters.

We may, then, state the following rule for the conversion of propositions in which the whole relation explicitly stated is taken as the copula: Transpose the terms, and for the given relation substitute its reciprocal. Thus--

A is the cause of B .'. B is the effect of A.

The rule assumes that the reciprocal of a given relation is definitely known; and so far as this is true it may be extended to more concrete relations--

A is a genus of B .'. B is a species of A A is the father of B .'. B is a child of A.

But not every relational expression has only one definite reciprocal. If we are told that _A is the brother of B_, we can only infer that _B is either the brother or the sister of A_. A list of all reciprocal relations is a desideratum of Logic.

Sec. 5. Obversion (otherwise called Permutation or AEquipollence) is Immediate Inference by changing the quality of the given proposition and substituting for its predicate the contradictory term. The given proposition is called the 'obvertend,' and the inference from it the 'obverse.' Thus the obvertend being--_Some philosophers are consistent reasoners_, the obverse will be--_Some philosophers are not inconsistent reasoners_.

The legitimacy of this mode of reasoning follows, in the case of affirmative propositions, from the principle of Contradiction, that if any term be affirmed of a subject, the contradictory term may be denied (chap. vi. Sec. 3). To obvert affirmative propositions, then, the rule is--Insert the negative sign, and for the predicate substitute its contradictory term.

A. _All S is P .'. No S is not-P All men are fallible .'. No men are infallible._

I. _Some S is P .'. some S is not-P Some philosophers are consistent .'. Some philosophers are not inconsistent._

In agreement with this mode of inference, we have the rule of modern English grammar, that 'two negatives make an affirmative.'

Again, by the principle of Excluded Middle, if any term be denied of a subject, its contradictory may be affirmed: to obvert negative propositions, then, the rule is--Remove the negative sign, and for the predicate substitute its contradictory term.

E. _No S is P .'. All S is not-P No matter is destructible .'. All matter is indestructible._

O. _Some S is not P .'. Some S is not-P Some ideals are not attainable .'. Some ideals are unattainable._

Thus, by obversion, each of the four propositions retains its quantity but changes its quality: A. to E., I. to O., E. to A., O. to I. And all the obverses are infinite propositions, the affirmative infinites having the sense of negatives, and the negative infinites having the sense of affirmatives.

Again, having obtained the obverse of a given proposition, it may be desirable to recover the obvertend; or it may at any time be requisite to change a given infinite proposition into the corresponding direct affirmative or negative; and in such cases the process is still obversion. Thus, if _No S is not-P_ be given us to recover the obvertend or to find the corresponding affirmative; the proposition being formally negative, we apply the rule for obverting negatives: 'Remove the negative sign, and for the predicate substitute its contradictory.' This yields the affirmative _All S is P_. Similarly, to obtain the obvertend of _All S is not-P_, apply the rule for obverting Affirmatives; and this yields _No S is P_.

Sec. 6. Contrariety.--We have seen in chap. iv. Sec. 8, that contrary terms are such that no two of them are predicable in the same way of the same subject, whilst perhaps neither may be predicable of it. Similarly, Contrary Propositions may be defined as those of which no two are ever both true together, whilst perhaps neither may be true; or, in other words, both may be false. This is the relation between A. and E. when concerned with the same matter: as A.--_All men are wise_; E.--_No men are wise_. Such propositions cannot both be true; but they may both be false, for some men may be wise and some not. They cannot both be true; for, by the principle of Contradiction, if _wise_ may be affirmed of _All men, not-wise_ must be denied; but _All men are not-wise_ is the obverse of _No men are wise_, which therefore may also be denied.

At the same time we cannot apply to A. and E. the principle of Excluded Middle, so as to show that one of them must be true of the same matter. For if we deny that _All men are wise_, we do not necessarily deny the attribute 'wise' of each and every man: to say that _Not all are wise_ may mean no more than that _Some are not_. This gives a proposition in the form of O.; which, as we have seen, does not imply its subalternans, E.

If, however, two Singular Propositions, having the same matter, but differing in quality, are to be treated as universals, and therefore as A. and E., they are, nevertheless, contradictory and not merely contrary; for one of them must be false and the other true.

Sec. 7. Contradiction is a relation between two propositions analogous to that between contradictory terms (one of which being affirmed of a subject the other is denied)--such, namely, that one of them is false and the other true. This is the case with the forms A. and O., and E. and I., in the same matter. If it be true that _All men are wise_, it is false that _Some men are not wise_ (equivalent by obversion to _Some men are not-wise_); or else, since the 'Some men' are included in the 'All men,' we should be predicating of the same men that they are both 'wise' and 'not-wise'; which would violate the principle of Contradiction. Similarly, _No men are wise_, being by obversion equivalent to _All men are not-wise_, is incompatible with _Some men are wise_, by the same principle of Contradiction.

But, again, if it be false that _All men are wise_, it is always true that _Some are not wise_; for though in denying that 'wise' is a predicate of 'All men' we do not deny it of each and every man, yet we deny it of 'Some men.' Of 'Some men,' therefore, by the principle of Excluded Middle, 'not-wise' is to be affirmed; and _Some men are not-wise_, is by obversion equivalent to _Some men are not wise_. Similarly, if it be false that _No men are wise_, which by obversion is equivalent to _All men are not-wise_, then it is true at least that _Some men are wise_.

By extending and enforcing the doctrine of relative terms, certain other inferences are implied in the contrary and contradictory relations of propositions. We have seen in chap. iv. that the contradictory of a given term includes all its contraries: 'not-blue,' for example, includes red and yellow. Hence, since _The sky is blue_ becomes by obversion, _The sky is not not-blue_, we may also infer _The sky is not red_, etc. From the truth, then, of any proposition predicating a given term, we may infer the falsity of all propositions predicating the contrary terms in the same relation. But, on the other hand, from the falsity of a proposition predicating

a given term, we cannot infer the truth of the predication of any particular contrary term. If it be false that _The sky is red_, we cannot formally infer, that _The sky is blue_ (_cf._ chap. iv. Sec. 8).

Sec. 8. Sub-contrariety is the relation of two propositions, concerning the same matter that may both be true but are never both false. This is the case with I. and O. If it be true that _Some men are wise_, it may also be true that _Some (other) men are not wise_. This follows from the maxim in chap. vi. Sec. 6, not to go beyond the evidence.

For if it be true that _Some men are wise_, it may indeed be true that _All are_ (this being the subalternans): and if _All are_, it is (by contradiction) false that _Some are not_; but as we are only told that _Some men are_, it is illicit to infer the falsity of _Some are not_, which could only be justified by evidence concerning _All men_.

But if it be false that _Some men are wise_, it is true that _Some men are not wise_; for, by contradiction, if _Some men are wise_ is false, _No men are wise_ is true; and, therefore, by subalternation, _Some men are not wise_ is true.

Sec. 9. The Square of Opposition.--By their relations of Subalternation, Contrariety, Contradiction, and Sub-contrariety, the forms A. I. E. O. (having the same matter) are said to stand in Opposition: and Logicians represent these relations by a square having A. I. E. O. at its corners:

A. Contraries E.

S Co s S u nt e u b ra i b a di r a l ct o l t ct o t e di r e r ra i r n nt e n s Co s s

I. Sub-contraries O.

As an aid to the memory, this diagram is useful; but as an attempt to represent the logical relations of propositions, it is misleading. For, standing at corners of the same square, A. and E., A. and I., E. and O., and I. and O., seem to be couples bearing the same relation to one another; whereas we have seen that their relations are entirely different. The following traditional summary of their relations in respect of truth and falsity is much more to the purpose:

(1) If A. is true, I. is true, E. is false, O. is false. (2) If A. is false, I. is unknown, E. is unknown, O. is true. (3) If I. is true, A. is unknown, E. is false, O. is unknown. (4) If I. is false, A. is false, E. is true, O. is true. (5) If E. is true, A. is false, I. is false, O. is true. (6) If E. is false, A. is unknown, I. is true, O. is unknown. (7) If O. is true, A. is false, I. is unknown, E. is unknown. (8) If O. is false, A. is true, I. is true, E. is false.

Where, however, as in cases 2, 3, 6, 7, alleging either the falsity of universals or the truth of particulars, it follows that two of the three Opposites are unknown, we may conclude further that one of them must be true and the other false, because the two unknown are always Contradictories.

Sec. 10. Secondary modes of Immediate Inference are obtained by applying the process of Conversion or Obversion to the results already obtained by the other process. The best known secondary form of Immediate Inference is the Contrapositive, and this is the converse of the obverse of a given proposition. Thus:

DATUM. OBVERSE. CONTRAPOSITIVE.

A. _All S is P_ .'. _No S is not-P_ .'. _No not-P is S_ I. _Some S is P_ .'. _Some S is not not-P_ .'. (none) E. _No S is P_ .'. _All S is not-P_ .'. _Some not-P is S_ O. _Some S is not P_ .'. _Some S is not-P_ .'. _Some not-P is S_

There is no contrapositive of I., because the obverse of I. is in the form of O., and we have seen that O. cannot be converted. O., however, has a contrapositive (_Some not-P is S_); and this is sometimes given instead of the converse, and called the 'converse by negation.'

Contraposition needs no justification by the Laws of Thought, as it is nothing but a compounding of conversion with obversion, both of which processes have already been justified. I give a table opposite of the other ways of compounding these primary modes of Immediate Inference.

A I E O ----------

1 All A is B Some A is B No A is B Some A is not B

Obverse 2 No A is b Some A is not b All A is b Some A is b

Converse 3 Some B is A Some B is A No B is A

Obverse of 4 Some B is not a Some B is not a All B is a Converse

---

Contra- positive 5 No b is A Some b is A Some b is A

Obverse of 6 All b is a Some b is not a Some b is not a Contrapos

---

Converse of Obverse 7 Some a is B of Converse

Obverse of Converse of 8 Some a is not b Obverse of Converse

Converse of Obverse 9 Some a is b of Contrapos

Obverse of Converse of 10 Some a is not B Obverse of Contrapos

---

In this table _a_ and _b_ stand for _not-A_ and _not-B_ and had better be read thus: for _No A is b, No A is not-B_; for _All b is a_ (col. 6), _All not-B is not-A_; and so on.

It may not, at first, be obvious why the process of alternately obverting and converting any proposition should ever come to an end; though it will, no doubt, be considered a very fortunate circumstance that it always does end. On examining the results, it will be found that the cause of its ending is the inconvertibility of O. For E., when obverted, becomes A.; every A, when converted, degenerates into I.; every I., when obverted, becomes O.; O cannot be converted, and to obvert it again is merely to restore the former proposition: so that the whole process moves on to inevitable dissolution. I. and O. are exhausted by three transformations, whilst A. and E. will each endure seven.

Except Obversion, Conversion and Contraposition, it has not been usual to bestow special names on these processes or their results. But the form in columns 7 and 10 (_Some a is B--Some a is not B_), where the original predicate is affirmed or denied of the contradictory of the original subject, has been thought by Dr. Keynes to deserve a distinctive title, and he has called it the 'Inverse.' Whilst the Inverse is one form, however, Inversion is not one process, but is obtained by different processes from E. and A. respectively. In this it differs from Obversion, Conversion, and Contraposition, each of which stands for one process.

The Inverse form has been objected to on the ground that the inference _All A is B .'. Some not-A is not B_, distributes _B_ (as predicate of a negative proposition), though it was given as undistributed (as predicate of an affirmative proposition). But Dr. Keynes defends it on the ground that (1) it is obtained by obversions and conversions which are all legitimate and (2) that although _All A is B_ does not distribute _B_ in relation to _A_, it does distribute _B_ in relation to some _not-A_ (namely, in relation to whatever _not-A_ is _not-B_). This is one reason why, in stating the rule in chap. vi. Sec. 6, I have written: "an immediate inference ought to contain nothing that is not contained, _or formally implied_, in the proposition from which it is inferred"; and have maintained that every term formally implies its contradictory within the _suppositio_.

Sec. 11. Immediate Inferences from Conditionals are those which consist--(1) in changing a Disjunctive into a Hypothetical, or a Hypothetical into a Disjunctive, or either into a Categorical; and (2) in the relations of Opposition and the equivalences of Obversion, Conversion, and secondary or compound processes, which we have already examined in respect of Categoricals. As no new principles are involved, it may suffice to exhibit some of the results.

We have already seen (chap. v. Sec. 4) how Disjunctives may be read as Hypotheticals and Hypotheticals as Categoricals. And, as to Opposition, if we recognise four forms of Hypothetical A. I. E. O., these plainly stand to one another in a Square of Opposition, just as Categoricals do. Thus A. and E. (_If A is B, C is D_, and _If A is B, C is not D_) are contraries, but not contradictories; since both may be false (_C_ may sometimes be _D_, and sometimes not), though they cannot both be true. And if they are both false, their subalternates are both true, being respectively the contradictories of the universals of opposite quality, namely, I. of E., and O. of A. But in the case of Disjunctives, we cannot set out a satisfactory Square of Opposition; because, as we saw (chap. v. Sec. 4), the forms required for E. and O. are not true Disjunctives, but Exponibles.

The Obverse, Converse, and Contrapositive, of Hypotheticals (admitting the distinction of quality) may be exhibited thus:

DATUM. OBVERSE.

A. _If A is B, C is D_ _If A is B, C is not d_ I. Sometimes _when A is B, C is D_ Sometimes _when A is B, C is not d_ E. _If A is B, C is not D_ _If A is B, C is d_ O. Sometimes _when A is B, C is not D_ Sometimes _when A is B, C is d_

CONVERSE. CONTRAPOSITIVE.

Sometimes _when C is D, A is B_ _If C is d, A is not B_ Sometimes _when C is D, A is B_ (none) _If C is D, A is not B_ Sometimes _when C is d, A is B_ (none) Sometimes _when C is d, A is B_

As to Disjunctives, the attempt to put them through these different forms immediately destroys their disjunctive character. Still, given any proposition in the form _A is either B or C_, we can state the propositions that give the sense of obversion, conversion, etc., thus:

DATUM.--_A is either B or C;_ OBVERSE.--_A is not both b and c;_ CONVERSE.--_Something, either B or C, is A;_ CONTRAPOSITIVE.--_Nothing that is both b and c is A_.

For a Disjunctive in I., of course, there is no Contrapositive. Given a Disjunctive in the form _Either A is B or C is D_, we may write for its Obverse--_In no case is A b, and C at the same time d_. But no Converse or Contrapositive of such a Disjunctive can be obtained, except by first casting it into the hypothetical or categorical form.

The reader who wishes to pursue this subject further, will find it elaborately treated in Dr. Keynes' _Formal Logic_, Part II.; to which work the above chapter is indebted.

CHAPTER VIII

ORDER OF TERMS, EULER'S DIAGRAMS, LOGICAL EQUATIONS, EXISTENTIAL IMPORT OF PROPOSITIONS

Sec. 1. Of the terms of a proposition which is the Subject and which the Predicate? In most of the exemplary propositions cited by Logicians it will be found that the subject is a substantive and the predicate an adjective, as in _Men are mortal_. This is the relation of Substance and Attribute which we saw (chap. i. Sec. 5) to be the central type of relations of coinherence; and on this model other predications may be formed in which the subject is not a substance, but is treated as if it were, and could therefore be the ground of attributes; as _Fame is treacherous, The weather is changeable_. But, in literature, sentences in which the adjective comes first are not uncommon, as _Loud was the applause, Dark is the fate of man, Blessed are the peacemakers_, and so on. Here, then, 'loud,' 'dark' and 'blessed' occupy the place of the logical subject. Are they really the subject, or must we alter the order of such sentences into _The applause was loud_, etc.? If we do, and then proceed to convert, we get _Loud was the applause_, or (more scrupulously) _Some loud noise was the applause_. The last form, it is true, gives the subject a substantive word, but 'applause' has become the predicate; and if the substantive 'noise' was not implied in the first form, _Loud is the applause_, by what right is it now inserted? The recognition of Conversion, in fact, requires us to admit that, formally, in a logical proposition, the term preceding the copula is subject and the one following is predicate. And, of course, materially considered, the mere order of terms in a proposition can make no difference in the method of proving it, nor in the inferences that can be drawn from it.

Still, if the question is, how we may best cast a literary sentence into logical form, good grounds for a definite answer may perhaps be found. We must not try to stand upon the naturalness of expression, for _Dark is the fate of man_ is quite as natural as _Man is mortal_. When the purpose is not merely to state a fact, but also to express our feelings about it, to place the grammatical predicate first may be perfectly natural and most effective. But the grounds of a logical order of statement must be found in its adaptation to the purposes of proof and inference. Now general propositions are those from which most inferences can be drawn, which, therefore, it is most important to establish, if true; and they are also the easiest to disprove, if false; since a single negative instance suffices to establish the contradictory. It follows that, in re-casting a literary or colloquial sentence for logical purposes, we should try to obtain a form in which the subject is distributed--is either a singular term or a general term predesignate as 'All' or 'No.' Seeing, then, that most adjectives connote a single attribute, whilst most substantives connote more than one attribute; and that therefore the denotation of adjectives is usually wider than that of substantives; in any proposition, one term of which is an adjective and the other a substantive, if either can be distributed in relation to the other, it is nearly sure to be the substantive; so that to take the substantive term for subject is our best chance of obtaining an universal proposition. These considerations seem to justify the practice of Logicians in selecting their examples.

For similar reasons, if both terms of a proposition are substantive, the one with the lesser denotation is (at least in affirmative propositions) the more suitable subject, as _Cats are carnivores_. And if one term is abstract, that is the more suitable subject; for, as we have seen, an abstract term may be interpreted by a corresponding concrete one distributed, as _Kindness is infectious_; that is, _All kind actions suggest imitation_.

If, however, a controvertist has no other object in view than to refute some general proposition laid down by an opponent, a particular proposition is all that he need disentangle from any statement that serves his purpose.

Sec. 2. Toward understanding clearly the relations of the terms of a proposition, it is often found useful to employ diagrams; and the diagrams most in use are the circles of Euler.

These circles represent the denotation of the terms. Suppose the proposition to be _All hollow-horned animals ruminate_: then, if we could collect all ruminants upon a prairie, and enclose them with a circular palisade; and segregate from amongst them all the hollow-horned beasts, and enclose them with another ring-fence inside the other; one way of interpreting the proposition (namely, in denotation) would be figured to us thus:

[Illustration: FIG. 1.]

An Universal Affirmative may also state a relation between two terms whose denotation is co-extensive. A definition always does this, as _Man is a rational animal_; and this, of course, we cannot represent by two distinct circles, but at best by one with a thick circumference, to suggest that two coincide, thus:

[Illustration: FIG. 2.]

The Particular Affirmative Proposition may be represented in several ways. In the first place, bearing in mind that 'Some' means 'some at least, it may be all,' an I. proposition may be represented by Figs. 1 and 2; for it is true that _Some horned animals ruminate_, and that _Some men are rational_. Secondly, there is the case in which the 'Some things' of which a predication is made are, in fact, not all; whilst the predicate, though not given as distributed, yet might be so given if we wished to state the whole truth; as if we say _Some men are Chinese_. This case is also represented by Fig. 1, the outside circle representing 'Men,' and the inside one 'Chinese.' Thirdly, the predicate may appertain to some only of the subject, but to a great many other things, as in _Some horned beasts are domestic_; for it is true that some are not, and that certain other kinds of animals are, domestic. This case, therefore, must be illustrated by overlapping circles, thus:

[Illustration: FIG. 3.]

The Universal Negative is sufficiently represented by a single Fig. (4): two circles mutually exclusive, thus:

[Illustration: FIG. 4.]

That is, _No horned beasts are carnivorous_.

Lastly, the Particular Negative may be represented by any of the Figs. 1, 3, and 4; for it is true that _Some ruminants are not hollow-horned_, that _Some horned animals are not domestic_, and that _Some horned beasts are not carnivorous_.

Besides their use in illustrating the denotative force of propositions, these circles may be employed to verify the results of Obversion, Conversion, and the secondary modes of Immediate Inference. Thus the Obverse of A. is clear enough on glancing at Figs. 1 and 2; for if we agree that whatever term's denotation is represented by a given circle, the denotation of the contradictory term shall be represented by the space outside that circle; then if it is true that _All hollow horned animals are ruminants_, it is at the same time true that _No hollow-horned animals are not-ruminants_; since none of the hollow-horned are found outside the palisade that encloses the ruminants. The Obverse of I., E. or O. may be verified in a similar manner.

As to the Converse, a Definition is of course susceptible of Simple Conversion, and this is shown by Fig. 2: 'Men are rational animals' and 'Rational animals are men.' But any other A. proposition is presumably convertible only by limitation, and this is shown by Fig. 1; where _All hollow-horned animals are ruminants_, but we can only say that _Some ruminants are hollow-horned_.

That I. may be simply converted may be seen in Fig. 3, which represents the least that an I. proposition can mean; and that E. may be simply converted is manifest in Fig. 4.

As for O., we know that it cannot be converted, and this is made plain enough by glancing at Fig. 1; for that represents the O., _Some ruminants are not hollow-horned_, but also shows this to be compatible with _All hollow-horned animals are ruminants_ (A.). Now in conversion there is (by definition) no change of quality. The Converse, then, of _Some ruminants are not hollow-horned_ must be a negative proposition, having 'hollow-horned' for its subject, either in E. or O.; but these would be respectively the contrary and contradictory of _All hollow-horned animals are ruminants_; and, therefore, if this be true, they must both be false.

But (referring still to Fig. 1) the legitimacy of contrapositing O. is equally clear; for if _Some ruminants are not hollow-horned_, _Some animals that are not hollow-horned are ruminants_, namely, all the animals between the two ring-fences. Similar inferences may be illustrated from Figs. 3 and 4. And the Contraposition of A. may be verified by Figs. 1 and 2, and the Contraposition of E. by Fig. 4.

Lastly, the Inverse of A. is plain from Fig. 1--_Some things that are not hollow-horned are not ruminants_, namely, things that lie outside the outer circle and are neither 'ruminants' nor 'hollow-horned.' And the Inverse of E may be studied in Fig. 4--_Some things that are not-horned beasts are carnivorous_.

Notwithstanding the facility and clearness of the demonstrations thus obtained, it may be said that a diagrammatic method, representing denotations, is not properly logical. Fundamentally, the relation asserted (or denied) to exist between the terms of a proposition, is a relation between the terms as determined by their attributes or connotation; whether we take Mill's view, that a proposition asserts that the connotation of the subject is a mark of the connotation of the predicate; or Dr. Venn's view, that things denoted by the subject (as having its connotation) have (or have not) the attribute connoted by the predicate; or, the Conceptualist view, that a judgment is a relation of concepts (that is, of connotations). With a few exceptions artificially framed (such as 'kings now reigning in Europe'), the denotation of a term is never directly and exhaustively known, but consists merely in 'all things that have the connotation.' If the value of logical training depends very much upon our habituating ourselves to construe propositions, and to realise the force of inferences from them, according to the connotation of their terms, we shall do well not to turn too hastily to the circles, but rather to regard them as means of verifying in denotation the conclusions that we have already learnt to recognise as necessary in connotation.

Sec. 3. The equational treatment of propositions is closely connected with the diagrammatic. Hamilton thought it a great merit of his plan of quantifying the predicate, that thereby every proposition is reduced to its true form--an equation. According to this doctrine, the proposition _All X is all Y_ (U.) equates X and Y; the proposition _All X is some Y_ (A.) equates X with some part of Y; and similarly with the other affirmatives (Y. and I.). And so far it is easy to follow his meaning: the Xs are identical with some or all the Ys. But, coming to the negatives, the equational interpretation is certainly less obvious. The proposition _No X is Y_ (E.) cannot be said in any sense to equate X and Y; though, if we obvert it into _All X is some not-Y_, we have (in the same sense, of course, as in the above affirmative forms) X equated with part at least of 'not-Y.'

But what is that sense? Clearly not the same as that in which mathematical terms are equated, namely, in respect of some mode of quantity. For if we may say _Some X is some Y_, these Xs that are also Ys are not merely the same in number, or mass, or figure; they are the same in every respect, both quantitative and qualitative, have the same positions in time and place, are in fact identical. The proposition 2+2=4 means that any two things added to any other two are, _in respect of number_, equal to any three things added to one other thing; and this is true of all things that can be counted, however much they may differ in other ways. But

All X is all Y means that Xs and Ys are the same things, although they have different names when viewed in different aspects or relations. Thus all equilateral triangles are equiangular triangles; but in one case they are named from the equality of their angles, and in the other from the equality of their sides. Similarly, 'British subjects' and 'subjects of King George V' are the same people, named in one case from the person of the Crown, and in the other from the Imperial Government. These logical equations, then, are in truth identities of denotation; and they are fully illustrated by the relations of circles described in the previous section.

When we are told that logical propositions are to be considered as equations, we naturally expect to be shown some interesting developments of method in analogy with the equations of Mathematics; but from Hamilton's innovations no such thing results. This cannot be said, however, of the equations of Symbolic Logic; which are the starting-point of very remarkable processes of ratiocination. As the subject of Symbolic Logic, as a whole, lies beyond the compass of this work, it will be enough to give Dr. Venn's equations corresponding with the four propositional forms of common Logic.

According to this system, universal propositions are to be regarded as not necessarily implying the existence of their terms; and therefore, instead of giving them a positive form, they are translated into symbols that express what they deny. For example, the proposition _All devils are ugly_ need not imply that any such things as 'devils' really exist; but it certainly does imply that _Devils that are not ugly do not exist_. Similarly, the proposition _No angels are ugly_ implies that _Angels that are ugly do not exist_. Therefore, writing _x_ for 'devils,' _y_ for 'ugly,' and _[y]_ for 'not-ugly,' we may express A., the universal affirmative, thus:

A. _x[y]_ = 0.

That is, _x that is not y is nothing_; or, _Devils that are not-ugly do not exist_. And, similarly, writing _x_ for 'angels' and _y_ for 'ugly,' we may express E., the universal negative, thus:

E. _xy_ = 0.

That is, _x that is y is nothing_; or, _Angels that are ugly do not exist_.

On the other hand, particular propositions are regarded as implying the existence of their terms, and the corresponding equations are so framed as to express existence. With this end in view, the symbol v is adopted to represent 'something,' or indeterminate reality, or more than nothing. Then, taking any particular affirmative, such as _Some metaphysicians are obscure_, and writing _x_ for 'metaphysicians,' and _y_ for 'obscure,' we may express it thus:

I. _xy_ = v.

That is, _x that is y is something_; or, _Metaphysicians that are obscure do occur in experience_ (however few they may be, or whether they all be obscure). And, similarly, taking any particular negative, such as _Some giants are not cruel_, and writing _x_ for 'giants' and _y_ for 'not-cruel,' we may express it thus:

O. _x[y]_ = v.

That is, _x that is not y is something_; or, _giants that are not-cruel do occur_--in romances, if nowhere else.

Clearly, these equations are, like Hamilton's, concerned with denotation. A. and E. affirm that the compound terms x[y] and xy have no denotation; and I. and O. declare that x[y] and xy have denotation, or stand for something. Here, however, the resemblance to Hamilton's system ceases; for the Symbolic Logic, by operating upon more than two terms simultaneously, by adopting the algebraic signs of operations, +,-, x, / (with a special signification), and manipulating the symbols by quasi-algebraic processes, obtains results which the common Logic reaches (if at all) with much greater difficulty. If, indeed, the value of logical systems were to be judged of by the results obtainable, formal deductive Logic would probably be superseded. And, as a mental discipline, there is much to be said in favour of the symbolic method. But, as an introduction to philosophy, the common Logic must hold its ground. (Venn: _Symbolic Logic_, c. 7.)

Sec. 4. Does Formal Logic involve any general assumption as to the real existence of the terms of propositions?

In the first place, Logic treats primarily of the _relations_ implied in propositions. This follows from its being the science of proof for all sorts of (qualitative) propositions; since all sorts of propositions have nothing in common except the relations they express.

But, secondly, relations without terms of some sort are not to be thought of; and, hence, even the most formal illustrations of logical doctrines comprise such terms as S and P, X and Y, or x and y, in a symbolic or representative character. Terms, therefore, of

some sort are assumed to exist (together with their negatives or contradictories) _for the purposes of logical manipulation_.

Thirdly, however, that Formal Logic cannot as such directly involve the existence of any particular concrete terms, such as 'man' or 'mountain,' used by way of illustration, is implied in the word 'formal,' that is, 'confined to what is common or abstract'; since the only thing common to all terms is to be related in some way to other terms. The actual existence of any concrete thing can only be known by experience, as with 'man' or 'mountain'; or by methodically justifiable inference from experience, as with 'atom' or 'ether.' If 'man' or 'mountain,' or 'Cuzco' be used to illustrate logical forms, they bring with them an existential import derived from experience; but this is the import of language, not of the logical forms. 'Centaur' and 'El Dorado' signify to us the non-existent; but they serve as well as 'man' and 'London' to illustrate Formal Logic.

Nevertheless, fourthly, the existence or non-existence of particular terms may come to be implied: namely, wherever the very fact of existence, or of some condition of existence, is an hypothesis or datum. Thus, given the proposition _All S is P_, to be P is made a condition of the existence of S: whence it follows that an S that is not P does not exist (_x[y]_ = 0). On the further hypothesis that S exists, it follows that P exists. On the hypothesis that S does not exist, the existence of P is problematic; but, then, if P does exist we cannot convert the proposition; since _Some P is S_ (P existing) would involve the existence of S; which is contrary to the hypothesis.

Assuming that Universals _do not_, whilst Particulars _do_, imply the existence of their subjects, we cannot infer the subalternate (I. or O.) from the subalternans (A. or E.), for that is to ground the actual on the problematic; and for the same reason we cannot convert A. _per accidens_.

Assuming, again, a certain _suppositio_ or universe, to which in a given discussion every argument shall refer, then, any propositions whose terms lie outside that _suppositio_ are irrelevant, and for the purposes of that discussion are sometimes called "false"; though it seems better to call them irrelevant or meaningless, seeing that to call them false implies that they might in the same case be true. Thus propositions which, according to the doctrine of Opposition, appear to be Contradictories, may then cease to be so; for of Contradictories one is true and the other false; but, in the case supposed, both are meaningless. If the subject of discussion be Zoology, all propositions about centaurs or unicorns are absurd; and such specious Contradictories as _No centaurs play the lyre--Some centaurs do play the lyre_; or _All unicorns fight with lions--Some unicorns do not fight with lions_, are both meaningless, because in Zoology there are no centaurs nor unicorns; and, therefore, in this reference, the propositions are not really contradictory. But if the subject of discussion or _suppositio_ be Mythology or Heraldry, such propositions as the above are to the purpose, and form legitimate pairs of Contradictories.

In Formal Logic, in short, we may make at discretion any assumption whatever as to the existence, or as to any condition of the existence of any particular term or terms; and then certain implications and conclusions follow in consistency with that hypothesis or datum. Still, our conclusions will themselves be only hypothetical, depending on the truth of the datum; and, of course, until this is empirically ascertained, we are as far as ever from empirical reality. (Venn: _Symbolic Logic_, c. 6; Keynes: _Formal Logic_, Part II. c. 7: _cf._ Wolf: _Studies in Logic_.)

CHAPTER IX

FORMAL CONDITIONS OF MEDIATE INFERENCE

Sec. 1. A Mediate Inference is a proposition that depends for proof upon two or more other propositions, so connected together by one or more terms (which the evidentiary propositions, or each pair of them, have in common) as to justify a certain conclusion, namely, the proposition in question. The type or (more properly) the unit of all such modes of proof, when of a strictly logical kind, is the Syllogism, to which we shall see that all other modes are reducible. It may be exhibited symbolically thus:

M is P; S is M: .'. S is P.

Syllogisms may be classified, as to quantity, into Universal or Particular, according to the quantity of the conclusion; as to quality, into Affirmative or Negative, according to the quality of the conclusion; and, as to relation, into Categorical, Hypothetical and Disjunctive, according as all their propositions are categorical, or one (at least) of their evidentiary propositions is a hypothetical or a disjunctive.

To begin with Categorical Syllogisms, of which the following is an example:

All authors are vain; Cicero is an author: .'. Cicero is vain.

Here we may suppose that there are no direct means of knowing that Cicero is vain; but we happen to know that all authors are vain and that he is an author; and these two propositions, put together, unmistakably imply that he is vain. In other words, we do not at first know any relation between 'Cicero' and 'vanity'; but we know that these two terms are severally related to a third term, 'author,' hence called a Middle Term; and thus we perceive, by mediate evidence, that they are related to one another. This sort of proof bears an obvious resemblance (though the relations involved are not the same) to the mathematical proof of equality between two quantities, that cannot be directly compared, by showing the equality of each of them to some third quantity: A = B = C .'. A = C. Here B is a middle term.

We have to inquire, then, what conditions must be satisfied in order that a Syllogism may be formally conclusive or valid. A specious Syllogism that is not really valid is called a Parasyllogism.

Sec. 2. General Canons of the Syllogism.

(1) A Syllogism contains three, and no more, distinct propositions.

(2) A Syllogism contains three, and no more, distinct univocal terms.

These two Canons imply one another. Three propositions with less than three terms can only be connected in some of the modes of Immediate Inference. Three propositions with more than three terms do not show that connection of two terms by means of a third, which is requisite for proving a Mediate Inference. If we write--

All authors are vain; Cicero is a statesman--

there are four terms and no middle term, and therefore there is no proof. Or if we write--

All authors are vain; Cicero is an author: .'. Cicero is a statesman--

here the term 'statesman' occurs without any voucher; it appears in the inference but not in the evidence, and therefore violates the maxim of all formal proof, 'not to go beyond the evidence.' It is true that if any one argued--

All authors are vain; Cicero wrote on philosophy: .'. Cicero is vain--

this could not be called a bad argument or a material fallacy; but it would be a needless departure from the form of expression in which the connection between the evidence and the inference is most easily seen.

Still, a mere adherence to the same form of words in the expression of terms is not enough: we must also attend to their meaning. For if the same word be used ambiguously (as 'author' now for 'father' and anon for 'man of letters'), it becomes as to its meaning two terms; so that we have four in all. Then, if the ambiguous term be the Middle, no connection is shown between the other two; if either of the others be ambiguous, something seems to be inferred which has never been really given in evidence.

The above two Canons are, indeed, involved in the definition of a categorical syllogism, which may be thus stated: A Categorical Syllogism is a form of proof or reasoning (way of giving reasons) in which one categorical proposition is established by comparing two others that contain together only three terms, or that have one and only one term in common.

The proposition established, derived, or inferred, is called the Conclusion: the evidentiary propositions by which it is proved are called the Premises.

The term common to the premises, by means of which the other terms are compared, is called the Middle Term; the subject of the conclusion is called the Minor Term; the predicate of the conclusion, the Major Term.

The premise in which the minor term occurs is called the Minor Premise; that in which the major term occurs is called the Major Premise. And a Syllogism is usually written thus:

Major Premise--All authors (Middle) are vain (Major);

Minor Premise--Cicero (Minor) is an author (Middle):

Conclusion--.'. Cicero (Minor) is vain (Major).

Here we have three propositions with three terms, each term occurring twice. The minor and major terms are so called, because, when the conclusion is an universal affirmative (which only occurs in Barbara; see chap. x. Sec. 6), its subject and predicate are respectively the less and the greater in extent or denotation; and the premises are called after the peculiar terms they contain: the expressions 'major premise' and 'minor premise' have nothing to do with the order in which the premises are presented; though it is usual to place the major premise first.

(3) No term must be distributed in the conclusion unless it is distributed in the premises.

It is usual to give this as one of the General Canons of the Syllogism; but we have seen (chap. vi. Sec. 6) that it is of wider application. Indeed, 'not to go beyond the evidence' belongs to the definition of formal proof. A breech of this rule in a syllogism is the fallacy of Illicit Process of the Minor, or of the Major, according to which term has been unwarrantably distributed. The following parasyllogism illicitly distributes both terms of the conclusion:

All poets are pathetic; Some orators are not poets: .'. No orators are pathetic.

(4) The Middle Term must be distributed at least once in the premises (in order to prove a conclusion in the given terms).

For the use of mediate evidence is to show the relation of terms that cannot be directly compared; this is only possible if the middle term furnishes the ground of comparison; and this (in Logic) requires that the whole denotation of the middle should be either included or excluded by one of the other terms; since if we only know that the other terms are related to _some_ of the middle, their respective relations may not be with the same part of it.

It is true that in what has been called the "numerically definite syllogism," an inference may be drawn, though our canon seems to be violated. Thus:

60 sheep in 100 are horned; 60 sheep in 100 are blackfaced: .'. at least 20 blackfaced sheep in 100 are horned.

But such an argument, though it may be correct Arithmetic, is not Logic at all; and when such numerical evidence is obtainable the comparatively indefinite arguments of Logic are needless. Another apparent exception is the following:

Most men are 5 feet high; Most men are semi-rational: .'. Some semi-rational things are 5 feet high.

Here the Middle Term (men) is distributed in neither premise, yet the indisputable conclusion is a logical proposition. The premises, however, are really arithmetical; for 'most' means 'more than half,' or more than 50 per cent.

Still, another apparent exception is entirely logical. Suppose we are given, the premises--_All P is M_, and _All S is M_--the middle term is undistributed. But take the obverse of the contrapositive of both premises:

All m is p; All m is s: .'. Some s is p.

Here we have a conclusion legitimately obtained; but it is not in the terms originally given.

For Mediate Inference depending on truly logical premises, then, it is necessary that one premise should distribute the middle term; and the reason of this may be illustrated even by the above supposed numerical exceptions. For in them the premises are such that, though neither of the two premises by itself distributes the Middle, yet they always overlap upon it. If each premise dealt with exactly half the Middle, thus barely distributing it between them, there would be no logical proposition inferrible. We require that the middle term, as used in one premise, should necessarily overlap the same term as used in the other, so as to furnish common ground for comparing the other terms. Hence I have defined the middle term as 'that term common to both premises by means of which the other terms are compared.'

(5) One at least of the premises must be affirmative; or, from two negative premises nothing can be inferred (in the given terms).

The fourth Canon required that the middle term should be given distributed, or in its whole extent, at least once, in order to afford sure ground of comparison for the others. But that such comparison may be effected, something more is requisite; the relation of the other terms to the Middle must be of a certain character. One at least of them must be, as to its extent or denotation, partially or wholly identified with the Middle; so that to that extent it may be known to bear to the other term, whatever relation we are told that so much of the Middle bears to that other term. Now, identity of denotation can only be predicated in an affirmative proposition: one premise, then, must be affirmative.

If both premises are negative, we only know that both the other terms are partly or wholly excluded from the Middle, or are not identical with it in denotation: where they lie, then, in relation to one another we have no means of knowing. Similarly, in the mediate comparison of quantities, if we are told that A and C are both of them unequal to B, we can infer nothing as to the relation of C to A. Hence the premises--

No electors are sober; No electors are independent--

however suggestive, do not formally justify us in inferring any connection between sobriety and independence. Formally to draw a conclusion, we must have affirmative grounds, such as in this case we may obtain by obverting both premises:

All electors are not-sober; All electors are not-independent: .'. Some who are not-independent are not-sober.

But this conclusion is not in the given terms.

(6) (a) If one premise be negative, the conclusion must be negative: and (b) to prove a negative conclusion, one premise must be negative.

(a) For we have seen that one premise must be affirmative, and that thus one term must be partly (at least) identified with the Middle. If, then, the other premise, being negative, predicates the exclusion of the remaining term from the Middle, this remaining term must be excluded from the first term, so far as we know the first to be identical with the Middle: and this exclusion will be expressed by a negative conclusion. The analogy of the mediate comparison of quantities may here again be noticed: if A is equal to B, and B is unequal to C, A is unequal to C.

(b) If both premises be affirmative, the relations to the Middle of both the other terms are more or less inclusive, and therefore furnish no ground for an exclusive inference. This also follows from the function of the middle term.

For the more convenient application of these canons to the testing of syllogisms, it is usual to derive from them three Corollaries:

(i) Two particular premises yield no conclusion.

For if both premises be affirmative, _all_ their terms are undistributed, the subjects by predesignation, the predicates by position; and therefore the middle term must be undistributed, and there can be no conclusion.

If one premise be negative, its predicate is distributed by position: the other terms remaining undistributed. But, by Canon 6, the conclusion (if any be possible) must be negative; and therefore its predicate, the major term, will be distributed. In the premises, therefore, both the middle and the major terms should be distributed, which is impossible: e.g.,

Some M is not P; Some S is M: .'. Some S is not P.

Here, indeed, the major term is legitimately distributed (though the negative premise might have been the minor); but M, the middle term, is distributed in neither premise, and therefore there can be no conclusion.

Still, an exception may be made by admitting a bi-designate conclusion:

Some P is M; Some S is not M: .'. Some S is not some P.

(ii) If one premise be particular, so is the conclusion.

For, again, if both premises be affirmative, they only distribute one term, the subject of the universal premise, and this must be the middle term. The minor term, therefore, is undistributed, and the conclusion must be particular.

If one premise be negative, the two premises together can distribute only two terms, the subject of the universal and the predicate of the negative (which may be the same premise). One of these terms must be the middle; the other (since the conclusion is negative) must be the major. The minor term, therefore, is undistributed, and the conclusion must be particular.

(iii) From a particular major and a negative minor premise nothing can be inferred.

For the minor premise being negative, the major premise must be affirmative (5th Canon); and therefore, being particular, distributes the major term neither in its subject nor in its predicate. But since the conclusion must be negative (6th Canon), a distributed major term is demanded, e.g.,

Some M is P; No S is M: .'. ------

Here the minor and the middle terms are both distributed, but not the major (P); and, therefore, a negative conclusion is impossible.

Sec. 3. First Principle or Axiom of the Syllogism.--Hitherto in this chapter we have been analysing the conditions of valid mediate inference. We have seen that a single step of such inference, a Syllogism, contains, when fully expressed in language, three propositions and three terms, and that these terms must stand to one another in the relations required by the fourth, fifth, and sixth Canons. We now come to a principle which conveniently sums up these conditions; it is called the _Dictum de omni et nullo_, and may be stated thus:

Whatever is predicated (affirmatively or negatively) of a term distributed,

With which term another term can be (partly or wholly) identified,

May be predicated in like manner (affirmatively or negatively) of the latter term (or part of it).

Thus stated (nearly as by Whately in the introduction to his _Logic_) the _Dictum_ follows line by line the course of a Syllogism in the First Figure (see chap. X. Sec. 2). To return to our former example: _All authors are vain_ is the same as--Vanity is predicated of all authors; _Cicero is an author_ is the same as--Cicero is identified as an author; therefore _Cicero is vain_, or--Vanity may be predicated of Cicero. The _Dictum_ then requires: (1) three propositions; (2) three terms; (3) that the middle term be distributed; (4) that one premise be affirmative, since only by an affirmative proposition can one term be identified with another; (5) that if one premise be negative the conclusion shall be so too, since whatever is predicated of the middle term is predicated _in like manner_ of the minor.

Thus far, then, the _Dictum_ is wholly analytic or verbal, expressing no more than is implied in the definitions of 'Syllogism' and 'Middle Term'; since (as we have seen) all the General Canons (except the third, which is a still more general condition of formal proof) are derivable from those definitions. However, the _Dictum_ makes a further statement of a synthetic or real character, namely, that _when these conditions are fulfilled an inference is justified_; that then the major and minor terms are brought into comparison through the middle, and that the major term may be predicated affirmatively or negatively of all or part of the minor. It is this real assertion that justifies us in calling the _Dictum_ an Axiom.

Sec. 4. Whether the Laws of Thought may not fully explain the Syllogism without the need of any synthetic principle has, however, been made a question. Take such a syllogism as the following:

All domestic animals are useful; All pugs are domestic animals: .'. All pugs are useful.

Here (an ingenious man might urge), having once identified pugs with domestic animals, that they are useful follows from the Law of Identity. If we attend to the meaning, and remember that what is true in one form of words is true in any other form, then, all domestic animals being useful, of course pugs are. It is merely a case of subalternation: we may put it in this way:

All domestic animals are useful: .'. Some domestic animals (e.g., pugs) are useful.

The derivation of negative syllogisms from the Law of Contradiction (he might add) may be shown in a similar manner.

But the force of this ingenious argument depends on the participial clause--'having once identified pugs with domestic animals.' If this is a distinct step of the reasoning, the above syllogism cannot be reduced to one step, cannot be exhibited as mere subalternation, nor be brought directly under the law of Identity. If 'pug,' 'domestic,' and 'useful' are distinct terms; and if 'pug' and 'useful' are only known to be connected because of their relations to 'domestic': this is something more than the Laws of Thought provide for: it is not Immediate Inference, but Mediate; and to justify it, scientific method requires that its conditions be generalised. The _Dictum_, then, as we have seen, does generalise these conditions, and declares that when such conditions are satisfied a Mediate Inference is valid.

But, after all (to go back a little), consider again that proposition _All pugs are domestic animals_: is it a distinct step of the reasoning; that is to say, is it a Real Proposition? If, indeed, 'domestic' is no part of the definition of 'pug,' the proposition is real, and is a distinct part of the argument. But take such a case as this:

All dogs are useful; All pugs are dogs.

Here we clearly have, in the minor premise, only a verbal proposition; to be a dog is certainly part of the definition of 'pug.' But, if so, the inference 'All pugs are useful' involves no real mediation, and the argument is no more than this:

All dogs are useful; .'. Some dogs (e.g., pugs) are useful.

Similarly, if the major premise be verbal, thus:

All men are rational; Socrates is a man--

to conclude that 'Socrates is rational' is no Mediate Inference; for so much was implied in the minor premise, 'Socrates is a man,' and the major premise adds nothing to this.

Hence we may conclude (as anticipated in chap. vii. Sec. 3) that 'any apparent syllogism, having one premise a verbal proposition, is really an Immediate Inference'; but that, if both premises are real propositions, the Inference is Mediate, and demands for its explanation something more than the Laws of Thought.

The fact is that to prove the minor to be a case of the middle term may be an exceedingly difficult operation (chap. xiii. Sec. 7). The difficulty is disguised by ordinary examples, used for the sake of convenience.

Sec. 5. Other kinds of Mediate Inference exist, yielding valid conclusions, without being truly syllogistic. Such are mathematical inferences of Equality, as--

A = B = C .'. A = C.

Here, according to the usual logical analysis, there are strictly four terms--(1) A, (2) equal to B, (3) B, (4) equal to C.

Similarly with the argument _a fortiori_,

A > B > C .'. (much more) A > C.

This also is said to contain four terms: (1) A, (2) greater than B, (3) B, (4) greater than C. Such inferences are nevertheless intuitively sound, may be verified by trial (within the limits of sense-perception), and are generalised in appropriate axioms of their own, corresponding to the _Dictum_ of the syllogism; as 'Things equal to the same thing are equal to one another,' etc.

Now, surely, this is an erroneous application of the usual logical analysis of propositions. Both Logic and Mathematics treat of the _relations_ of terms; but whilst Mathematics employs the sign = for only one kind of relation, and for that relation exclusive of the terms; Logic employs the same signs (_is_ or _is not_) for all relations, recognising only a difference of quality in predication, and treating every other difference of relation as belonging to one of the terms related. Thus Logicians read _A--is--equal to B_: as if _equal to B_ could possibly be a term co-relative with A. Whence it follows that the argument _A = B = C .'. A = C_ contains four terms; though everybody sees that there are only three.

In fact (as observed in chap. ii. Sec. 2) the sign of logical relation (_is_ or _is not_), whilst usually adequate for class-reasoning (coinherence) and sometimes extensible to causation (because a cause implies a class of events), should never be stretched to include other relations in such a way as to sacrifice intelligence to formalism. And, besides mathematical or quantitative relations, there are others (usually considered qualitative because indefinite) which cannot be justly expressed by the logical copula. We ought to read propositions expressing time-relations (and inferences drawn accordingly) thus:

B--is before--C; A--is before--B: .'. A--is before--C.

And in like manner _A--is simultaneous with--B; etc._ Such arguments (as well as the mathematical) are intuitively sound and verifiable, and might be generalised in axioms if it were worth while: but it is not, because no method could be founded on such axioms.

The customary use of relative terms justifies some Mediate Inferences, as, _The father of a father is a grand-father_.

Some cases, however, that at first seem obvious, are really delusive unless further data be supplied. Thus _A co-exists with B, B with C; .'. A with C_--is not sound unless _B_ is an instantaneous event; for where B is perdurable, _A_ may co-exist with it at one time and _C_ at another.

Again: _A is to the left of B, B of C; .'. A of C_. This may pass; but it is not a parallel argument that if _A is north of B and B west of C_, then _A is north-west of C_: for suppose that A is a mile to the north of B, and B a yard to the west of C, then A is practically north of C; at least, its westward position cannot be expressed in terms of the mariner's compass. In such a case we require to know not only the directions but the distances of A and C from B; and then the exact direction of A from C is an affair of mathematical calculation.

Qualitative reasoning concerning position is only applicable to things in one dimension of space, or in time considered as having one dimension. Under these conditions we may frame the following generalisation concerning all Mediate Inferences: Two terms definitely related to a third, and one of them positively, are related to one another as the other term is related to the third (that is, positively or negatively); provided that the relations given are of the same kind (that is, of Time, or Coinherence, or Likeness, or Equality).

Thus, to illustrate by relations of Time--

B is simultaneous with C; A is not simultaneous with B: .'. A is not simultaneous with C.

Here the relations are of the same kind but of different logical quality, and (as in the syllogism) a negative copula in the premises leads to a negative conclusion.

An examination in detail of particular cases would show that the above generalisation concerning all Mediate Inferences is subject to too many qualifications to be called an Axiom; it stands to the real Axioms (the _Dictum_, etc.) as the notion of the Uniformity of Nature does to the definite principles of natural order (_cf._ chap. xiii. Sec. 9).

CHAPTER X

CATEGORICAL SYLLOGISMS

Sec. 1. The type of logical, deductive, mediate, categorical Inference is a Syllogism directly conformable with the _Dictum_: as--

All carnivores (M) are excitable (P); Cats (S) are carnivores (M): .'. Cats (S) are excitable (P).

In this example P is predicated of M, a term distributed; in which term, M, S is given as included; so that P may be predicated of S.

Many arguments, however, are of a type superficially different from the above: as--

No wise man (P) fears death (M); Balbus (S) fears death (M): .'. Balbus (S) is not a wise man (P).

In this example, instead of P being predicated of M, M is predicated of P, and yet S is given as included not in P, but in M. The divergence of such a syllogism from the _Dictum_ may, however, be easily shown to be superficial by writing, instead of _No wise man fears death_, the simple, converse, _No man who fears death is wise_.

Again:

Some dogs (M) are friendly to man (P); All dogs (M) are carnivores (S): .'. Some carnivores (S) are friendly to man (P).

Here P is predicated of M undistributed; and instead of S being included in M, M is included in S: so that the divergence from the type of syllogism to which the _Dictum_ directly applies is still greater than in the former case. But if we transpose the premises, taking first

All dogs (M) are carnivores (P),

then P is predicated of M distributed; and, simply converting the other premise, we get--

Some things friendly to man (S) are dogs (M):

whence it follows that--

Some things friendly to man (S) are carnivores (P);

and this is the simple converse of the original conclusion.

Once more:

No pigs (P) are philosophers (M); Some philosophers (M) are hedonists (S): .'. Some hedonists (S) are not pigs (P).

In this case, instead of P being predicated of M distributed, M is predicated of P distributed; and instead of S (or part of it) being included in M, we are told that some M is included in S. Still there is no real difficulty. Simply convert both the premises, and we have:

No philosophers (M) are pigs (P); Some hedonists (S) are philosophers (M).

Whence the same conclusion follows; and the whole syllogism plainly conforms directly to the _Dictum_.

Such departures as these from the normal syllogistic form are said to constitute differences of Figure (see Sec. 2); and the processes by which they are shown to be unessential differences are called Reduction (see Sec. 6).

Sec. 2. Figure is determined by the position of the Middle Term in the premises; of which position there are four possible variations. The middle term may be subject of the major premise, and predicate of the minor, as in the first example above; and this position, being directly conformable to the requirements of the _Dictum_, is called the First Figure. Or the middle term may be predicate of both premises, as in the second of the above examples; and this is called the Second Figure. Or the middle term may be subject of both premises, as in the third of the above examples; and this is called the Third Figure. Or, finally, the middle term may be predicate of the major premise, and subject of the minor, as in the fourth example given above; and this is the Fourth Figure.

It may facilitate the recollection of this most important point if we schematise the figures thus:

I. II. III. IV.

M---P P---M M---P P---M \ | | / \ | | / \ | | / S---M S---M M---S M---S

The horizontal lines represent the premises, and at the angles formed with them by the slanting or by the perpendicular lines the middle term occurs. The schema of Figure IV. resembles Z, the last letter of the alphabet: this helps one to remember it in contrast with Figure I., which is thereby also remembered. Figures II. and III. seem to stand back to back.

Sec. 3. The Moods of each Figure are the modifications of it which arise from different combinations of propositions according to quantity and quality. In Figure I., for example, four Moods are recognised: A.A.A., E.A.E., A.I.I., E.I.O.

A. All M is P; A. All S is M: A. .'. All S is P.

E. No M is P; A. All S is M: E. .'. No S is P.

A. All M is P; I. Some S is M: I. .'. Some S is P.

E. No M is P; I. Some S is M: O. .'. Some S is not P.

Now, remembering that there are four Figures, and four kinds of propositions (A. I. E. O.), each of which propositions may be major premise, minor premise, or conclusion of a syllogism, it appears that in each Figure there may be 64 Moods, and therefore 256 in all. On examining these 256 Moods, however, we find that only 24 of them are valid (i.e., of such a character that the conclusion strictly follows from the premises), whilst 5 of these 24 are needless, because their conclusions are 'weaker' or less extensive than the premises warrant; that is to say, they are particular when they might be universal. Thus, in Figure I., besides the above 4 Moods, A.A.I. and E.A.O. are valid in the sense of being conclusive; but they are superfluous, because included in A.A.A. and E.A.E. Omitting, then, these 5 needless Moods, which are called 'Subalterns' because their conclusions are subaltern (chap. vii. Sec. 2) to those of other Moods, there remain 19 Moods that are valid and generally recognised.

Sec. 4. How these 19 Moods are determined must be our next inquiry. There are several ways more or less ingenious and interesting; but all depend on the application, directly or indirectly, of the Six Canons, which were shown in the last chapter to be the conditions of Mediate Inference.

(1) One way is to begin by finding what Moods of Figure I. conform to the _Dictum_. Now, the _Dictum_ requires that, in the major premise, P be predicated of a term distributed, from which it follows that no Mood can be valid whose major premise is particular, as in I.A.I. or O.A.O. Again, the _Dictum_ requires that the minor premise be affirmative ("with which term another is identified"); so that no Mood can be valid whose minor premise is negative, as in A.E.E. or A.O.O. By such considerations we find that in Figure I.,

out of 64 Moods possible, only six are valid, namely, those above-mentioned in Sec. 3, including the two subalterns. The second step of this method is to test the Moods of the Second, Third, and Fourth Figures, by trying whether they can be reduced to one or other of the four Moods of the First (as briefly illustrated in Sec. 1, and to be further explained in Sec. 6).

(2) Another way is to take the above six General or Common Canons, and to deduce from them Special Canons for testing each Figure: an interesting method, which, on account of its length, will be treated of separately in the next section.

(3) Direct application of the Common Canons is, perhaps, the simplest plan. First write out the 64 Moods that are possible without regard to Figure, and then cross out those which violate any of the Canons or Corollaries, thus:

[Transcriber's Note: Moods surrounded with square brackets were crossed out in the original text.]

AAA, [AAE] (6th Can. b). AAI. [AAO] (6th Can. b). [AEA] (6th Can. a) AEE, [AEI] (6th Can. a) AEO, [AIA] (Cor. ii.) [AIE] (6th Can. b) AII, [AIO] (6th Can. b) [AOA] (6th Can. a) [AOE] (Cor. ii.) [AOI] (6th Can. a) AOO.

Whoever has the patience to go through the remaining 48 Moods will discover that of the whole 64 only 11 are valid, namely:

A.A.A., A.A.I., A.E.E., A.E.O., A.I.I., A.O.O., E.A.E., E.A.O., E.I.O., I.A.I., O.A.O.

These 11 Moods have next to be examined in each Figure, and if valid in every Figure there will still be 44 moods in all. We find, however, that in the First Figure, A.E.E., A.E.O., A.O.O. involve illicit process of the major term (3rd Can.); I.A.I., O.A.O. involve undistributed Middle (4th Can.); and A.A.I., E.A.O. are subalterns. In the Second Figure all the affirmative Moods, A.A.A., A.A.I., A.I.I., I.A.I., involve undistributed Middle; O.A.O. gives illicit process of the major term; and A.E.O., E.A.O. are subalterns. In the Third Figure, A.A.A., E.A.E., involve illicit process of the minor term (3rd Can.); A.E.E., A.E.O., A.O.O., illicit process of the major term. In the Fourth Figure, A.A.A. and E.A.E. involve illicit process of the minor term; A.I.I., A.O.O., undistributed Middle; O.A.O. involves illicit process of the major term; and A.E.O. is subaltern.

Those moods of each Figure which, when tried by these tests, are not rejected, are valid, namely:

Fig. I.--A.A.A., E.A.E., A.I.I., E.I.O. (A.A.I., E.A.O., Subaltern);

Fig. II.--E.A.E., A.E.E., E.I.O., A.O.O. (E.A.O., A.E.O., Subaltern);

Fig. III.--A.A.I., I.A.I., A.I.I., E.A.O., O.A.O., E.I.O.;

Fig. IV.--A.A.I., A.E.E., I.A.I., E.A.O., E.I.O. (A.E.O., Subaltern).

Thus, including subaltern Moods, there are six valid in each Figure. In Fig. III. alone there is no subaltern Mood, because in that Figure there can be no universal conclusion.

Sec. 5. Special Canons of the several Figures, deduced from the Common Canons, enable us to arrive at the same result by a somewhat different course. They are not, perhaps, necessary to the Science, but afford a very useful means of enabling one to thoroughly appreciate the character of formal syllogistic reasoning. Accordingly, the proof of each rule will be indicated, and its elaboration left to the reader. There is no difficulty, if one bears in mind that Figure is determined by the position of the middle term.

Fig. I., Rule (a): _The minor premise must be affirmative_.

For, if not, in negative Moods there will be illicit process of the major term. Applying this rule to the eleven possible Moods given in Sec. 4, as remaining after application of the Common Canons, it eliminates A.E.E., A.E.O., A.O.O.

(b) _The major premise must be universal_.

For, if not, the minor premise being affirmative, the middle term will be undistributed. This rule eliminates I.A.I., O.A.O.; leaving six Moods, including two subalterns.

Fig. II. (a) _One premise must be negative._

For else neither premise will distribute the middle term. This rule eliminates A.A.A., A.A.I., A.I.I., I.A.I.

(b) _The major premise must be universal._

For else, the conclusion being negative, there will be illicit process of the major term. This eliminates I.A.I., O.A.O.; leaving six Moods, including two subalterns.

Fig. III. (a) _The minor premise must be affirmative._

For else, in negative moods there will be illicit process of the major term. This rule eliminates A.E.E., A.E.O., A.O.O.

(b) _The conclusion must be particular._

For, if not, the minor premise being affirmative, there will be illicit process of the minor term. This eliminates A.A.A., A.E.E., E.A.E.; leaving six Moods.

Fig. IV. (a) _When the major premise is affirmative, the minor must be universal._

For else the middle term is undistributed. This eliminates A.I.I., A.O.O.

(b) _When the minor premise is affirmative the conclusion must be particular._

Otherwise there will be illicit process of the minor term. This eliminates A.A.A., E.A.E.

(c) _When either premise is negative, the major must be universal._

For else, the conclusion being negative, there will be illicit process of the major term. This eliminates O.A.O.; leaving six Moods, including one subaltern.

Sec. 6. Reduction is either--(1) Ostensive or (2) Indirect. Ostensive Reduction consists in showing that an argument given in one Mood can also be stated in another; the process is especially used to show that the Moods of the second, third, and fourth Figures are equivalent to one or another Mood of the first Figure. It thus proves the validity of the former Moods by showing that they also essentially conform to the _Dictum_, and that all Categorical Syllogisms are only superficial varieties of one type of proof.

To facilitate Reduction, the recognised Moods have all had names given them; which names, again, have been strung together into mnemonic verses of great force and pregnancy:

Barbara, Celarent, Darii, Ferioque prioris: Cesare, Camestres, Festino, Baroco, secundae: Tertia, Darapti, Disamis, Datisi, Felapton, Bocardo, Ferison, habet: Quarta insuper addit Bramantip, Camenes, Dimaris, Fesapo, Fresison.

In the above verses the names of the Moods of Fig. I. begin with the first four consonants B, C, D, F, in alphabetical order; and the names of all other Moods likewise begin with these letters, thus signifying (except in Baroco and Bocardo) the mood of Fig. I., to which each is equivalent, and to which it is to be reduced: as Bramantip to Barbara, Camestres to Celarent, and so forth.

The vowels A, E, I, O, occurring in the several names, give the quantity and quality of major premise, minor premise, and conclusion in the usual order.

The consonants s and p, occurring after a vowel, show that the proposition which the vowel stands for is to be converted either (s) simply or (p) _per accidens_; except where s or p occurs after the third vowel of a name, the conclusion: then it refers not to the conclusion of the given Mood (say Disamis), but to the conclusion of that Mood of the first Figure to which the given Mood is reduced (Darii).

M (_mutare_, metathesis) means 'transpose the premises' (as of Ca_m_estres).

C means 'substitute the contradictory of the conclusion for the foregoing premise,' a process of the Indirect Reduction to be presently explained (see Baroco, Sec. 8).

The other consonants, r, n, t (with b and d, when not initial), occurring here and there, have no mnemonic significance.

What now is the problem of Reduction? The difference of Figures depends upon the position of the Middle Term. To reduce a Mood of any other Figure to the form of the First, then, we must so manipulate its premises that the Middle Term shall be subject of the major premise and predicate of the minor premise.

Now in Fig. II. the Middle Term is predicate of both premises; so that the minor premise may need no alteration, and to convert the major premise may suffice. This is the case with Cesare, which reduces to Celarent by simply converting the major premise; and

with Festino, which by the same process becomes Ferio. In Camestres, however, the minor premise is negative; and, as this is impossible in Fig. I., the premises must be transposed, and the new major premise must be simply converted: then, since the transposition of the premises will have transposed the terms of the conclusion (according to the usual reading of syllogisms), the new conclusion must be simply converted in order to prove the validity of the original conclusion. The process may be thus represented (_s.c._ meaning 'simply convert')

Camestres. Celarent.

All P is M; ----\ /---> No M is S; \ c/ \/ s/\ / \ No S is M: ----/ \---> All P is M:

s.c. .'. No S is P. <---------- No P is S.

The Ostensive Reduction of Baroco also needs special explanation; for as it used to be reduced indirectly, its name gives no indication of the ostensive process. To reduce it ostensively let us call it Faksnoko, where k means 'obvert the foregoing premise.' By thus obverting (k) and simply converting (s) (in sum, contrapositing) the major premise, and obverting the minor premise, we get a syllogism in Ferio, thus:

Baroco or Faksnoko. Ferio. _contrap_ All P is M; ----------> No m (not-M) is P;

obv Some S is not M: ----------> Some S is m (not-M): .'. Some S is not P. .'. Some S is not P.

In Fig. III. the middle term is subject of both premises; so that, to reduce its Moods to the First Figure, it may be enough to convert the minor premise. This is the case with Darapti, Datisi, Felapton, and Ferison. But, with Disamis, since the major premise must in the First Figure be universal, we must transpose the premises, and then simply convert the new minor premise; and, lastly, since the major and minor terms have now changed places, we must simply convert the new conclusion in order to verify the old one. Thus:

Disamis. Darii.

Some M is P; ----\ /---> All M is S; \s./ \/ /\c. / \ All M is S: ----/ \---> Some P is M:

s.c. .'. Some S is P. <---------- .'. Some P is S.

Bocardo, like Baroco, indicates by its name the indirect process. To reduce it ostensively let its name be Doksamrosk, and proceed thus:

Bocardo or Doksamrosk. Darii.

Some M is not P; ----------\ /---------> All M is S; \ / \/ /\ _contrap_ / \ All M is S: ----------/ \---------> Some p (not-P) is M:

convert & obvert .'. Some S is not P. <---------- .'. Some p (not-P) is S.

In Fig. IV. the position of the middle term is, in both premises, the reverse of what it is in the First Figure; we may therefore reduce its Moods either by transposing the premises, as with Bramantip, Camenes, and Dimaris; or by converting both premises, the course pursued with Fesapo and Fresison. It may suffice to illustrate by the case of Bramantip:

Bramantip. Barbara.

All P is M; ----------\ /------> All M is S; \/ /\ All M is S: ----------/ \------> All P is M:

convert per acc. .'. Some S is P. <---------- .'. All P is S.

This case shows that a final significant consonant (s, p, or sk) in the name of any Mood refers to the conclusion of the new syllogism in the First Figure; since p in Bramantip cannot refer to that Mood's own conclusion in I.; which, being already particular, cannot be converted _per accidens_.

Finally, in Fig. I., Darii and Ferio differ respectively from Barbara and Celarent only in this, that their minor premises, and consequently their conclusions, are subaltern to the corresponding propositions of the universal Moods; a difference which seems insufficient to give them rank as distinct forms of demonstration. And as for Barbara and Celarent, they are easily reducible to one another by obverting their major premises and the new conclusions, thus:

Barbara. Celarent. obv. All M is P; ----------> No M is p (not-P);

All S is M: ----------> All S is M:

obv. .'. All S is P. <---------- .'. No S is p (not-P).

There is, then, only one fundamental syllogism.

Sec. 7. A new version of the mnemonic lines was suggested in _Mind_ No. 27, with the object of (1) freeing them from all meaningless letters, (2) showing by the name of each Mood the Figure to which it belongs, (3) giving names to indicate the ostensive reduction of Baroco and Bocardo. To obtain the first two objects, _l_ is used as the mark of Fig. I., _n_ of Fig II., _r_ of Fig. III., _t_ of Fig. IV. The verses (to be scanned discreetly) are as follows:

Balala, Celalel, Dalii, Felioque prioris:

{Faksnoko} Cesane, Camenes, Fesinon, { } secundae: { Banoco,}

Tertia, Darapri, Drisamis, Darisi, Ferapro,

Doksamrosk} }, Ferisor habet: Quarta insuper addit. Bocaro }

Bamatip, Cametes, Dimatis, Fesapto, Fesistot.

De Morgan praised the old verses as "more full of meaning than any others that ever were made"; and in defence of the above alteration it may be said that they now deserve that praise still more.

Sec. 8. Indirect reduction is the process of proving a Mood to be valid by showing that the supposition of its invalidity involves a contradiction. Take Baroco, and (since the doubt as to its validity is concerned not with the truth of the premises, but with their relation to the conclusion) assume the premises to be true. Then, if the conclusion be false, its contradictory is true. The conclusion being in O., its contradictory will be in A. Substituting this A. for the minor premise of Baroco, we have the premises of a syllogism in Barbara, which will be found to give a conclusion in A., contradictory of the original minor premise; thus:

Baroco. Barbara.

All P is M; ----------> All P is M;

Some S is not M: <-----\ /-----> All S is P: \ / contradictory \/ /\ contradictory / \ .'. Some S is not P ------/ \------ .'. All S is M.

But the original minor premise, _Some S is not M_, is true by hypothesis; and therefore the conclusion of Barbara, _All S is M_, is false. This falsity cannot, however, be due to the form of Barbara, which we know to be valid; nor to the major premise, which, being taken from Baroco, is true by hypothesis: it must, therefore, lie in the minor premise of Barbara, _All S is P_; and since this is contradictory of the conclusion of Baroco _Some S is not P_, that conclusion was true.

Similarly, with Bocardo, the Indirect Reduction proceeds by substituting for the major premise the contradictory of the conclusion; thus again obtaining the premises of a syllogism in Barbara, whose conclusion is contradictory of the original major premise. Hence the initial B in Baroco and Bocardo: it points to a syllogism in Barbara as the means of Indirect Reduction (_Reductio ad impossibile_).

Any other Mood may be reduced indirectly: as, for example, Dimaris. If this is supposed to be invalid and the conclusion false, substitute the contradictory of the conclusion for the major premise, thus obtaining the premises of Celarent:

Dimaris. Celarent.

contradictory Some P is M; <--------- --------> No S is P; \ / \/ All M is S: ----------/\---------> All M is S: / \ contradictory/ \ .'. Some S is P. ---------- -------- .'. No M is P} } simply converted .'. No P is M}

The conclusion of Celarent, simply converted, contradicts the original major premise of Dimaris, and is therefore false. Therefore the major premise of Celarent is false, and the conclusion of Dimaris is true. We might, of course, construct mnemonic names for the Indirect Reduction of all the Moods: the name of Dimaris would then be Cicari.

Sec. 9. The need or use of any Figure but the First has been much discussed by Logicians. Since, in actual debate, arguments are rarely stated in syllogistic form, and, therefore, if reduced to that form for closer scrutiny, generally have to be treated with some freedom; why not always throw them at once into the First Figure? That Figure has manifest advantages: it agrees directly with the _Dictum_; it gives conclusions in all four propositional forms, and therefore serves every purpose of full affirmation or denial, of showing agreement or difference (total or partial), of establishing the contradictories of universal statements; and it is the only Figure in which the subject and predicate of the conclusion occupy the same positions in the premises, so that the course of argument has in its mere expression an easy and natural flow.

Still, the Second Figure also has a very natural air in some kinds of negative arguments. The parallelism of the two premises, with the middle term as predicate in both, brings out very forcibly the necessary difference between the major and minor terms that is involved in their opposite relations to the middle term. _P is not, whilst S is, M_, says Cesare: that drives home the conviction that _S is not P_. Similarly in Camestres: _Deer do, oxen do not, shed their horns_. What is the conclusion?

The Third Figure, again, furnishes in Darapti and Felapton, the most natural forms of stating arguments in which the middle term is singular:

Socrates was truthful; Socrates was a Greek: .'. Some Greek was truthful.

Reducing this to Fig I., we should get for the minor premise, _Some Greek was Socrates_: which is certainly inelegant. Still, it might be urged that, in relation to proof, elegance is an extraneous consideration. And as for the other advantage claimed for Fig. III.--that, as it yields only particular conclusions, it is useful in establishing contradictories against universals--for that purpose none of its Moods can be better than Darii or Ferio.

As for Fig. IV., no particular advantage has been claimed for it. It is of comparatively late recognition (sometimes called the 'Galenian,' after Galen, its supposed discoverer); and its scientific claim to exist at all is disputed. It is said to be a mere inversion of Fig. I.; which is not true in any sense in which Figs. II. and III. may not be condemned as partial inversions of Fig. I., and as having therefore still less claim to recognition. It is also said to invert the order of thought; as if thought had only one order, or as if the order of thought had anything to do with Formal Logic. Surely, if distinction of Figure be recognised at all, the Fourth Figure is scientifically necessary, because it is inevitably generated by an analysis of the possible positions of the middle term.

Sec. 10. Is Reduction necessary, however; or have not all the Figures equal and independent validity? In one sense not only every Figure but each Mood has independent validity: for any one capable of abstract thinking sees its validity by direct inspection; and this is true not only of the abstract Moods, but very frequently of particular concrete arguments. But science aims at unifying knowledge; and after reducing all possible arguments that form categorical syllogisms to the nineteen Moods, it is another step in the same direction to reduce these Moods to one form. This is the very nature of science: and, accordingly, the efforts of some Logicians to expound separate principles of each Figure seem to be supererogatory. Grant that they succeed; and what can the next step be, but either to reduce these principles to the _Dictum_, or the _Dictum_ and the rest to one of these principles? Unless this can be done there is no science of Formal Logic. If it is done, what is gained by reducing the principles of the other Figures to the _Dictum_, instead of the Moods of the other Figures to those of the first Figure? It may, perhaps, be said that to show (1) that the Moods of the second, third, and fourth Figures flow from their own principles (though, in fact, these principles are laboriously adapted to the Moods); and (2) that these principles may be derived from the _Dictum_, is the more uncompromisingly gradual and regular method: but is not Formal Logic already sufficiently encumbered with formalities?

Sec. 11. Euler's diagrams are used to illustrate the syllogism, though not very satisfactorily, thus:

Barbara--

[Illustration: FIG. 5.]

Celarent--

[Illustration: FIG. 6.]

Darii--

[Illustration: FIG. 7.]

Remembering that 'Some' means 'It may be all,' it is plain that any one of these diagrams in Fig. 7, or the one given above for Barbara, may represent the denotative relations of P, M and S in Darii; though no doubt the diagram we generally think of as representing Darii is No. 1 in Fig. 7.

Remembering that A may be U, and that, therefore, wherever A occurs there may be only one circle for S and P, these syllogisms may be represented by only two circles, and Barbara by only one.

Ferio--

[Illustration: FIG. 8.]

Here, again, probably, we generally think of No. 1 as the diagram representing Ferio; but 2, or 3, or that given above for Celarent, is compatible with the premises.

If instead of dealing with M, P, and S, a concrete example be taken of Darii or Ferio, a knowledge of the facts of the case will show what diagram is suitable to it. But, then, surely it must be possible to do without the diagram. These diagrams, of course, can be used to illustrate Moods of the other Figures.

CHAPTER XI

ABBREVIATED AND COMPOUND ARGUMENTS

Sec. 1. In ordinary discussion, whether oral or written, it is but rarely that the forms of Logic are closely adhered to. We often leave wide gaps in the structure of our arguments, trusting the intelligence of those addressed to bridge them over; or we invert the regular order of propositions, beginning with the conclusion, and mentioning the premises, perhaps, a good while after, confident that the sagacity of our audience will make all smooth. Sometimes a full style, like Macaulay's, may, by means of amplification and illustration, spread the elements of a single syllogism over several pages--a pennyworth of logic steeped in so much eloquence. These practices give a great advantage to sophists; who would find it very inconvenient to state explicitly in Mood and Figure the pretentious antilogies which they foist upon the public; and, indeed, such licences of composition often prevent honest men from detecting errors into which they themselves have unwittingly fallen, and which, with the best intentions, they strive to communicate to others: but we put up with these drawbacks to avoid the inelegance and the tedium of a long discourse in accurate syllogisms.

Many departures from the strictly logical statement of reasonings consist in the use of vague or figurative language, or in the substitution for one another of expressions supposed to be equivalent, though, in fact, dangerously discrepant. Against such occasions of error the logician can provide no safeguard, except the advice to be careful and discriminating in what you say or hear. But as to any derangement of the elements of an argument, or the omission of them, Logic effectually aids the task of restoration; for it has shown what the elements are that enter into the explicit statement of most ratiocinations, namely, the four forms of propositions and what that connected order of propositions is which most easily and surely exposes the validity or invalidity of reasoning, namely, the premises and conclusion of the Syllogism. Logic has even gone so far as to name certain abbreviated forms of proof, which may be regarded as general types of those that actually occur in debate, in leading articles, pamphlets and other persuasive or polemic writings--namely, the Enthymeme, Epicheirema and Sorites.

Sec. 2. The Enthymeme, according to Aristotle, is the Syllogism of probable reasoning about practical affairs and matters of opinion, in contrast with the Syllogism of theoretical demonstration upon necessary grounds. But, as now commonly treated, it is an argument with one of its elements omitted; a Categorical Syllogism, having one or other of its premises, or else its conclusion, suppressed. If the major premise be suppressed, it is called an Enthymeme of the First Order; if the minor premise be wanting, it is said to be of the Second Order; if the conclusion be left to be understood, there is an Enthymeme of the Third Order.

Let the following be a complete Syllogism:

All free nations are enterprising; The Dutch are a free nation: .'. The Dutch are enterprising.

Reduced to Enthymemes, this argument may be put thus:

In the First Order:

The Dutch are a free nation: .'. The Dutch are enterprising.

In the Second Order--

All free nations are enterprising; .'. The Dutch are enterprising.

In the Third Order--

All free nations are enterprising; And the Dutch are a free nation.

It is certainly very common to meet with arguments whose statement may be represented by one or other of these three forms; indeed, the Enthymeme is the natural substitute for a full syllogism in oratory: whence the transition from Aristotle's to the modern meaning of the term. The most unschooled of men readily apprehend its force; and a student of Logic can easily supply the proposition that may be wanted in any case to complete a syllogism, and thereby test the argument's formal validity. In any Enthymeme of the Third Order, especially, to supply the conclusion cannot present any difficulty at all; and hence it is a favourite vehicle of innuendo, as in Hamilton's example:

Every liar is a coward; And Caius is a liar.

The frankness of this statement and its reticence, together, make it a biting sarcasm upon Caius.

The process of finding the missing premise in an Enthymeme of either the First or the Second Order, so as to constitute a syllogism, is sometimes called Reduction; and for this a simple rule may be given: Take that term of the given premise which does not occur in the conclusion (and which must therefore be the Middle), and combine it with that term of the conclusion which does not occur in the given premise; the proposition thus formed is the premise which was requisite to complete the Syllogism. If the premise thus constituted contain the predicate of the conclusion, the Enthymeme was of the First Order; if it contain the subject of the conclusion, the Enthymeme was of the Second Order.

That a statement in the form of a Hypothetical Proposition may really be an Enthymeme (as observed in chap. v. Sec. 4) can easily be shown by recasting one of the above Enthymemes thus: _If all free nations are enterprising, the Dutch are enterprising_. Such statements should be treated according to their true nature.

To reduce the argument of any ordinary discourse to logical form, the first care should be to make it clear to oneself what exactly the conclusion is, and to state it adequately but as succinctly as possible. Then look for the evidence. This may be of an inductive character, consisting of instances, examples, analogies; and, if so, of course its cogency must be evaluated by the principles of Induction, which we shall presently investigate. But if the evidence be deductive, it will probably consist of an Enthymeme, or of several Enthymemes one depending on another. Each Enthymeme may be isolated and expanded into a syllogism. And we may then inquire: (1) whether the syllogisms are formally correct according to Barbara (or whatever the appropriate Mood); (2) whether the premises, or the ultimate premises, are true in fact.

Sec. 3. A Monosyllogism is a syllogism considered as standing alone or without relation to other arguments. But, of course, a disputant may be asking to prove the premises of any syllogism; in which case other syllogisms may be advanced for that purpose. When the conclusion of one syllogism is used to prove another, we have a chain-argument which, stated at full length, is a Polysyllogism. In any Polysyllogism, again, a syllogism whose conclusion is used as the premise of another, is called in relation to that other a Prosyllogism; whilst a syllogism one of whose premises is the conclusion of another syllogism, is in relation to that other an Episyllogism. Two modes of abbreviating a Polysyllogism, are usually discussed, the Epicheirema and the Sorites.

Sec. 4. An Epicheirema is a syllogism for one or both of whose premises a reason is added; as--

All men are mortal, for they are animals; Socrates is a man, for rational bipeds are men: .'. Socrates is mortal.

The Epicheirema is called Single or Double, says Hamilton, according as an "adscititious proposition" attaches to one or both of the premises. The above example is of the double kind. The Single Epicheirema is said to be of the First Order, if the adscititious proposition attach to the major premise; if to the minor, of the Second Order. (Hamilton's _Logic_: Lecture xix.)

An Epicheirema, then, is an abbreviated chain of reasoning, or Polysyllogism, comprising an Episyllogism with one or two enthymematic Prosyllogisms. The major premise in the above case, _All men are mortal, for they are animals,_ is an Enthymeme of the First Order, suppressing its own major premise, and may be restored thus:

All animals are mortal; All men are animals: .'. All men are mortal.

The minor premise, _Socrates is a man, for rational bipeds are men_, is an Enthymeme of the Second Order, suppressing its own minor premise, and may be restored thus:

All rational bipeds are men; Socrates is a rational biped: .'. Socrates is a man.

Sec. 5. The Sorites is a Polysyllogism in which the Conclusions, and even some of the Premises, are suppressed until the arguments end. If the chain of arguments were freed of its enthymematic character, the suppressed conclusions would appear as premises of Episyllogisms.

Two varieties of Sorites are recognised, the Aristotelian (so called, though not treated of by Aristotle), and the Goclenian (named after its discoverer, Goclenius of Marburg, who flourished about 1600 A.D.). In order to compare these two forms of argument, it will be convenient to place side by side Hamilton's classical examples of them.

Aristotelian. Goclenian. Bucephalus is a horse; An animal is a substance; A horse is a quadruped; A quadruped is an animal; A quadruped is an animal; A horse is a quadruped; An animal is a substance: Bucephalus is a horse: .'. Bucephalus is a substance. .'. Bucephalus is a substance.

The reader wonders what is the difference between these two forms. In the Aristotelian Sorites the minor term occurs in the first premise, and the major term in the last; whilst in the Goclenian the major term occurs in the first premise, and the minor in the last. But since the character of premises is fixed by their terms, not by the order in which they are written, there cannot be a better example of a distinction without a difference. At a first glance, indeed, there may seem to be a more important point involved; the premises of the Aristotelian Sorites seem to proceed in the order of Fig. IV. But if that were really so the conclusion would be, _Some Substance is Bucephalus_. That, on the contrary, every one writes the conclusion, _Bucephalus is a substance_, proves that the logical order of the premises is in Fig. I. Logically, therefore, there is absolutely no difference between these two forms, and pure reason requires either that the "Aristotelian Sorites" disappear from the text-books, or that it be regarded as in Fig. IV., and its conclusion converted. It is the shining merit of Goclenius to have restored the premises of the Sorites to the usual order of Fig. I.: whereby he has raised to himself a monument more durable than brass, and secured indeed the very cheapest immortality.

The common Sorites, then, being in Fig. I., its rules follow from those of Fig. I:

(1) Only one premise can be particular; and, if any, only that in which the minor term occurs.

For, just as in Fig I., a particular premise anywhere else involves undistributed Middle.

(2) Only one premise can be negative; and, if any, only that in which the major term occurs.

For if there were two negative premises, at the point where the second entered the chain of argument there must be a syllogism with two negative premises, which is contrary to Rule 5; whilst if one premise be negative it must be that which contains the major term, for the same reason as in Fig. I., namely, that the conclusion will be negative, and that therefore only a negative major premise can prevent illicit process of the major term.

If we expand a Sorites into its constituent syllogisms, the conclusions successively suppressed will reappear as major premises; thus:

(1) An animal is a substance; A quadruped is an animal: .'. A quadruped is a substance.

(2) A quadruped is a substance; A horse is a quadruped: .'. A horse is a substance.

(3) A horse is a substance: Bucephalus is a horse: .'. Bucephalus is a substance.

This suffices to show that the Protosyllogism of a Goclenian Sorites is an Enthymeme of the Third Order; after which the argument is a chain of Enthymemes of the First Order, or of the First and Third combined, since the conclusions as well as the major premises are omitted, except in the last one.

Lest it should be thought that the Sorites is only good for arguments so frivolous as the above, I subjoin an example collected from various parts of Mill's _Political Economy_:--

The cost of labour depends on the efficiency of labour; The rate of profits depends on the cost of labour; The investment of capital depends on the rate of profits; Wages depend on the investment of capital: .'. Wages depend on the efficiency of labour.

Had it occurred to Mill to construct this Sorites, he would have modified his doctrine of the wages-fund, and would have spared many critics the malignant joy of refuting him.

Sec. 6. The Antinomy is a combination of arguments by which contradictory attributes are proved to be predicable of the same subject. In symbols, thus:

All M is P; All N is p; All S is M: All S is N: .'. All S is P. .'. All S is p.

Now, by the principle of Contradiction, S cannot be P and p (not-P): therefore, if both of the above syllogisms are sound, S, as the subject of contradictory attributes, is logically an impossible thing. The contradictory conclusions are called, respectively, Thesis and Antithesis.

To come to particulars, we may argue: (1) that a constitution which is at once a monarchy, an aristocracy and a democracy, must comprise the best elements of all three forms; and must, therefore, be the best of all forms of government: the British Constitution is, therefore, the best of all. But (2) such a constitution must also comprise the worst elements of monarchy, aristocracy and democracy; and, therefore, must be the worst of all forms. Are we, then, driven to conclude that the British Constitution, thus proved to be both the best and worst, does not really exist at all, being logically impossible? The proofs seem equally cogent; but perhaps neither the best nor the worst elements of the simpler constitutions need be present in our own in sufficient force to make it either good or bad.

Again:

(1) Every being who is responsible for his actions is free; Man is responsible for his actions: .'. Man is free.

(2) Every being whose actions enter into the course of nature is not free; Man is such a being: .'. Man is not free.

Does it, then, follow that 'Man,' as the subject of contradictory attributes, is a nonentity? This doctrine, or something like it, has been seriously entertained; but if to any reader it seem extravagant (as it certainly does to me), he will no doubt find an error in the above arguments. Perhaps the major term is ambiguous.

For other examples it is enough to refer to the _Critique of Pure Reason_, where Kant sets out the Antinomies of Rational Cosmology. But even if we do not agree with Kant that the human understanding, in attempting to deal with certain subjects beyond its reach, inevitably falls into such contradictory reasonings; yet it can hardly be doubted that we not unfrequently hold opinions which, if logically developed, result in Antinomies. And, accordingly, the Antinomy, if it cannot be imputed to Reason herself, may be a very fair, and a very wholesome _argumentum ad hominem_. It was the favourite weapon of the Pyrrhonists against the dogmatic philosophies that flourished after the death of Aristotle.

CHAPTER XII

CONDITIONAL SYLLOGISMS

Sec. 1. Conditional Syllogisms may be generally described as those that contain conditional propositions. They are usually divided into two classes, Hypothetical and Disjunctive.

A Hypothetical Syllogism is one that consists of a Hypothetical Major Premise, a Categorical Minor Premise, and a Categorical Conclusion. Two Moods are usually recognised the _Modus ponens_, in which the antecedent of the hypothetical major premise is affirmed; and the _Modus tollens_, in which its consequent is denied.

(1) _Modus ponens_, or Constructive.

If A is B, C is D; A is B: .'. C is D.

If Aristotle's reasoning is conclusive, Plato's theory of Ideas is erroneous;

Aristotle's reasoning is conclusive: .'. Plato's theory of Ideas is erroneous.

Rule of the _Modus ponens_: The antecedent of the major premise being affirmed in the minor premise, the consequent is also affirmed in the conclusion.

(2) _Modus tollens_, or Destructive.

If A is B, C is D; C is not D: .'. A is not B.

If Pythagoras is to be trusted, Justice is a number; Justice is not a number: .'. Pythagoras is not to be trusted.

Rule of the _Modus tollens_: The consequent of the major premise being denied in the minor premise, the antecedent is denied in the conclusion.

By using negative major premises two other forms are obtainable: then, either by affirming the antecedent or by denying the consequent, we draw a negative conclusion.

Thus (_Modus ponens_): (_Modus tollens_):

If A is B, C is not D; If A is B, C is not D; A is B: C is D: .'. C is not D. .'. A is not B.

Further, since the antecedent of the major premise, taken by itself, may be negative, it seems possible to obtain four more forms, two in each Mood, from the following major premises:

(1) If A is not B, C is D; (2) If A is not B, C is not D.

But since the quality of a Hypothetical Proposition is determined by the quality of its consequent, not at all by the quality of its antecedent, we cannot get from these two major premises any really new Moods, that is to say, Moods exhibiting any formal difference from the four previously expounded.

It is obvious that, given the hypothetical major premise--

If A is B, C is D--

we cannot, by denying the antecedent, infer a denial of the consequent. That A is B, is a mark of C being D; but we are not told that it is the sole and indispensable condition of it. If men read good books, they acquire knowledge; but they may acquire knowledge by other means, as by observation. For the same reason, we cannot by affirming the consequent infer the affirmation of the antecedent: Caius may have acquired knowledge; but we cannot thence conclude that he has read good books.

To see this in another light, let us recall chap. v. Sec. 4, where it was shown that a hypothetical proposition may be translated into a categorical one; whence it follows that a Hypothetical Syllogism may be translated into a Categorical Syllogism. Treating the above examples thus, we find that the _Modus ponens_ (with affirmative major premise) takes the form of Barbara, and the _Modus tollens_ the form of Camestres:

Modus ponens. Barbara.

If A is B, C is D; The case of A being B is a case of C being D; A is B: This is a case of A being B: .'. C is D. .'. This is a case of C being D.

Now if, instead of this, we affirm the consequent, to form the new minor premise,

This is a case of C being D,

there will be a Syllogism in the Second Figure with two affirmative premises, and therefore the fallacy of undistributed Middle. Again:

Modus tollens. Camestres.

If A is B, C is D; The case of A being B is a case of C being D: C is not D: This is not a case of C being D: .'. A is not B. .'. This is not a case of A being B.

But if, instead of this, we deny the antecedent, to form the new minor premise,

This is not a case of A being B,

there arises a syllogism in the First Figure with a negative minor premise, and therefore the fallacy of illicit process of the major term.

By thus reducing the Hypothetical Syllogism to the Categorical form, what is lost in elegance is gained in intelligibility. For, first, we may justify ourselves in speaking of the hypothetical premise as the major, and of the categorical premise as the minor; since in the categorical form they contain respectively the major and minor terms. And, secondly, we may justify ourselves in treating the Hypothetical Syllogism as a kind of Mediate Inference, in spite of the fact that it does not exhibit two terms compared by means of a third; since in the Categorical form such terms distinctly appear: a new term ('This') emerges in the position of the minor; the place of the Middle is filled by the antecedent of the major premise in the _Modus ponens_, and by the consequent in the _Modus tollens_.

The mediate element of the inference in a Hypothetical Syllogism consists in asserting, or denying, the fulfilment of a given condition; just as in a Categorical syllogism to identify the minor term with the Middle is a condition of the major term's being predicated of it. In the hypothetical proposition--

If A is B, C is D--

the Antecedent, _A is B_, is the _conditio sufficiens_, or mark, of the Consequent, _C is D_; and therefore the Consequent, _C is D_, is a _conditio sine qua non_ of the antecedent, _A is B_; and it is by means of affirming the former condition, or else denying the latter, that a conclusion is rendered possible.

Indeed, we need not say that the element of mediation consists in affirming, _or denying_, the fulfilment of a given condition: it is enough to say 'in affirming.' For thus to explain the _Modus tollens_, reduce it to the _Modus ponens_ (contrapositing the major premise and obverting the minor):

Celarent.

If A is B, C is D: The case of C being not-D is .'. If C is not-D, A is not B; not a case of A being B; C is not-D: This is a case of C being .'. A is not B. not-D: .'. This is not a case of A being B.

The above four forms commonly treated of as Hypothetical Syllogisms, are called by Ueberweg and Dr. Keynes 'Hypothetico-Categorical.' Ueberweg restricts the name 'Hypothetical' simply (and Dr. Keynes the name 'Conditional') to such Syllogisms as the following, having two Hypothetical Premises:

If C is D, E is F; If A is B, C is D: .'. If A is B, E is F.

If we recognise particular hypothetical propositions (see chap. v. Sec. 4), it is obvious that such Syllogisms may be constructed in all the Moods and Figures of the Categorical Syllogism; and of course they may be translated into Categoricals. We often reason in this hypothetical way. For example:

If the margin of cultivation be extended, rents will rise; If prices of produce rise, the margin of cultivation will be extended: .'. If prices of produce rise, rents will rise.

But the function of the Hypothetical Syllogism (commonly so called), as also of the Disjunctive Syllogism (to be discussed in the next section) is to get rid of the conditional element of the premises, to pass from suspense to certainty, and obtain a decisive categorical conclusion; whereas these Syllogisms with two hypothetical premises leave us still with a hypothetical conclusion. This circumstance seems to ally them more closely with Categorical Syllogisms than with those that are discussed in the present chapter. That they are Categoricals in disguise may be seen by considering that the above syllogism is not materially significant, unless in each proposition the word 'If' is equivalent to 'Whenever.' Accordingly, the name 'Hypothetical Syllogism,' is here employed in the older usage.

Sec. 2. A Disjunctive Syllogism consists of a Disjunctive Major Premise, a Categorical Minor Premise, and a Categorical Conclusion.

How many Moods are to be recognised in this kind of argument depends on whether the alternatives of the Disjunctive Premise are regarded as mutually exclusive or possibly coincident. In saying '_Either_ A is B, _or_ C is D,' do we mean 'either, but not both,' or 'either, it may be both'? (See chap. v. Sec. 4.)

When the alternatives of the Disjunctive are not exclusive, we have only the

Modus tollendo ponens.

Either A is B, or C is D; A is not B (or C is not D): .'. C is D (or A is B).

Either wages fall, or the weaker hands are dismissed;

Wages do not fall: .'. The weaker hands are dismissed.

But we cannot argue--

Wages fall: .'. The weaker hands are not dismissed;

since in 'hard times' both events may happen together.

Rule of the _Modus tollendo ponens_: If one alternative be denied, the other is affirmed.

When, however, the alternatives of the Disjunctive are mutually exclusive, we have also the

Modus ponendo tollens.

Either A is B, or C is D; A is B (or C is D): .'. C is not D (or A is not B).

Either the Tories or the Whigs win the election;

The Tories win: .'. The Whigs do not win.

We may also, of course, argue as above in the _Modus tollendo ponens_--

The Tories do not win: .'. The Whigs do.

But in this example, to make the _Modus tollendo ponens_ materially valid, it must be impossible that the election should result in a tie. The danger of the Disjunctive Proposition is that the alternatives may not, between them, exhaust the possible cases. Only contradictory alternatives are sure to cover the whole ground.

Rule of the _Modus ponendo tollens:_ If one alternative be affirmed, the other is denied.

Since a disjunctive proposition may be turned into a hypothetical proposition (chap. v. Sec. 4,) a Disjunctive Syllogism may be turned into a Hypothetical Syllogism:

Modus tollendo ponens. _Modus ponens._

Either A is B, or C is D; If A is not B, C is D; A is not B: A is not B: .'. C is D. .'. C is D.

Similarly the _Modus ponendo tollens_ is equivalent to that kind of _Modus ponens_ which may be formed with a negative major premise; for if the alternatives of a disjunctive proposition be exclusive, the corresponding hypothetical be affirmative or negative:

Modus ponendo tollens. _Modus ponens._

Either A is B, or C is D; If A is B, C is not D; A is B: A is B: .'. C is not D. .'. C is not D.

Hence, finally, a Disjunctive Syllogism being equivalent to a Hypothetical, and a Hypothetical to a Categorical; a Disjunctive Syllogism is equivalent and reducible to a Categorical. It is a form of Mediate Inference in the same sense as the Hypothetical Syllogism is; that is to say, the conclusion depends upon an affirmation, or denial, of the fulfilment of a condition implied in the disjunctive major premise.

Sec. 3. The Dilemma is perhaps the most popularly interesting of all forms of proof. It is a favourite weapon of orators and wits; and "impaled upon the horns of a dilemma" is a painful situation in which every one delights to see his adversary. It seems to have been described by Rhetoricians before finding its way into works on Logic; and Logicians, to judge from their diverse ways of defining it, have found some difficulty in making up their minds as to its exact character.

There is a famous Dilemma employed by Demosthenes, from which the general nature of the argument may be gathered:

If AEschines joined in the public rejoicings, he is inconsistent; if he did not, he is unpatriotic;

But either he joined, or he did not join:

Therefore he is either inconsistent or unpatriotic.

That is, reduced to symbols:

If A is B, C is D; and if E is F, G is H: But either A is B, or E is F; .'. Either C is D or G is H (_Complex Constructive_).

This is a compound Conditional Syllogism, which may be analysed as follows:

Either A is B or E is F.

Suppose that E is not F: Suppose that A is not B: Then A is B. Then E is F. But if A is B, C is D; But if E is F, G is H; (A is B): (E is F): .'. C is D. .'. G is H.

.'. Either C is D or G is H.

A Dilemma, then, is a compound Conditional Syllogism, having for its Major Premise two Hypothetical Propositions, and for its Minor Premise a Disjunctive Proposition, whose alternative terms either affirm the Antecedents or deny the Consequents of the two Hypothetical Propositions forming the Major Premise.

The hypothetical propositions in the major premise, may have all four terms distinct (as in the above example); and then the conclusion is a disjunctive proposition, and the Dilemma is said to be Complex. Or the two hypothetical propositions may have a common antecedent or a common consequent; and then the conclusion is a categorical proposition, and the Dilemma is said to be Simple.

Again, the alternatives of the disjunctive minor premise may be affirmative or negative: if affirmative, the Dilemma is called Constructive; and if negative, Destructive.

Using, then, only affirmative hypothetical propositions in the major premise, there are four Moods:

1. The Simple Constructive--

If A is B, C is D; and if E is F, C is D: But either A is B, or E is F: .'. C is D.

If the Tories win the election, the Government will avoid innovation; and if the Whigs win, the House of Lords will prevent them innovating:

But either the Tories or the Whigs will win:

.'. There will be no innovation.

2. The Complex Constructive--

If A is B, C is D; and if E is F, G is H: But either A is B, or E is F: .'. Either C is D or G is H.

If appearance is all that exists, reality is a delusion; and if there is a substance beyond consciousness, knowledge of reality is impossible:

But either appearance is all, or there is a substance beyond consciousness:

.'. Either reality is a delusion, or a knowledge of it is impossible.

3. Simple Destructive--

If A is B, C is D; and if A is B, E is F: But either C is not D, or E is not F: .'. A is not B.

If table-rappers are to be trusted, the departed are spirits; and they also exert mechanical energy:

But either the departed are not spirits, or they do not exert mechanical energy:

.'. Table-rappers are not to be trusted.

4. Complex Destructive--

If A is B, C is D; and if E is F, G is H: But either C is not D, or G is not H: .'. Either A is not B, or E is not F.

If poetic justice is observed, virtue is rewarded; and if the mirror is held up to Nature, the villain triumphs:

But either virtue is not rewarded, or the villain does not triumph:

.'. Either poetic justice is not observed, or the mirror is not held up to Nature.

Such are the four Moods of the Dilemma that emerge if we only use affirmative hypotheticals for the major premise; but, certainly, it is often quite as natural to employ two negative hypotheticals (indeed, one might be affirmative and the other negative; but waive that); and then four more moods emerge, all having negative conclusions. It is needless to intimidate the reader by drawing up these four moods in battle array: they always admit of reduction to the foregoing moods by obverting the hypotheticals. Still, by the same process we may greatly decrease the number of moods of the Categorical Syllogism; and just as some Syllogisms are most simply expressed in Celarent or Cesare, so some Dilemmas are most simply stated with negative major premises--e.g., The example of a Simple Constructive Dilemma above given would run more naturally thus: _If the Tories win, the Government will not innovate; and if the Whigs, the Lords will not let them_: and similarly Demosthenes' Dilemma--_If AEschines joined, he is not consistent; and if he did not, he is not patriotic_. Moreover, the propriety of recognising Dilemmas with negative major premises, follows from the above analysis of the Dilemma into a combination of Conditional Syllogisms, even if (as in Sec. 1 of this chapter) we take account of only four Moods of the Hypothetical Syllogism.

In the rhetorical use of the Dilemma, it may be observed that the disjunction in the minor premise ought to be obvious, or (at any rate) easily acceptable to the audience. Thus, _Either the Tories or the Whigs will win; Either AEschines joined in the rejoicings, or he did not_; such propositions are not likely to be disputed. But if the orator must stop to prove his minor premise, the smacking effect of this figure (if the expression be allowed) will be lost. Hence the minor premises of other examples given above are only fit for a select audience. That _Either ghosts are not spirits, or they do not exert mechanical energy_, supposes a knowledge of the principle, generally taught by physical philosophers, that only matter is the vehicle of energy; and that _Either appearance is all, or there is substance beyond consciousness_, is a doctrine which only metaphysical philosophers could be expected to understand, and upon which they could not be expected to agree. However, the chief danger is that a plausible disjunction may not be really such as to exclude any middle ground: _Either the Tories or the Whigs win_, is bad, if a tie be possible; though in the above argument this is negligible, seeing that a tie cannot directly cause innovations. _Either AEschines joined in the rejoicings, or he did not_, does not allow for a decent conformity with the public movement where resistance would be vain; yet such conformity as need not be inconsistent with subsequent condemnation of the proceedings, nor incompatible with patriotic reserve founded on a belief that the rejoicings are premature and ominous.

Another rhetorical consideration is, that the alternatives of the disjunctive conclusion of a Complex Dilemma should both point the same way, should be equally distasteful or paradoxical. 'Either inconsistent or unpatriotic': horrid words to a politician! 'Either no reality or no possible knowledge of it': very disappointing to an anxious inquirer! Thus the disjunctive conclusion is as bad for an opponent as the categorical one in a Simple Dilemma.

Logicians further speak of the Trilemma, with three Hypotheticals and a corresponding triple Disjunction; and of a Polylemma, with any further number of perplexities. But anyone who has a taste for logical forms may have it amply gratified in numerous text-books.

CHAPTER XIII

TRANSITION TO INDUCTION

Sec. 1. Having now discussed Terms, Propositions, Immediate and Mediate Inferences, and investigated the conditions of formal truth or consistency, we have next to consider the conditions of material truth: whether (or how far) it is possible to arrive at propositions that accurately represent the course of nature or of human life. Hitherto we have dealt with no sort of proof that gives any such assurance. A valid syllogism guarantees the truth of its conclusion, provided the premises be true: but what of the premises? The relation between the premises of a valid syllogism and its conclusion is the same as the relation between the antecedent and consequent of a hypothetical proposition. If A is B, C is D: grant that A is B, and it follows that C is D; and, similarly, grant the premises of a syllogism, and the conclusion follows. Again, grant that C is not D, and it follows that A is not B; and, similarly, if the conclusion of a valid syllogism be false, it follows that one, or other, or both of the premises must be false. But, once

more, grant that C is D, and it does not follow that A is B; so neither, if the conclusion of a syllogism be true, does it follow that the premises are. For example:--

Sociology is an exact science; Mathematics is a branch of Sociology: .'. Mathematics is an exact science.

Here the conclusion is true although the premises are absurd. Or again:--

Mathematics is an exact science; Sociology is a branch of Mathematics: .'. Sociology is an exact science.

Here the major premise is true, but the minor is false, and the conclusion is false. In both cases, however, whether the conclusion be true or false, it equally follows from the premises, if there is any cogency in Barbara. The explanation of this is, that Barbara has only formal cogency; and that whether the conclusion of that, or any other valid mood, shall be true according to fact and experience, depends upon how the form is filled up. How to establish the premises, then, is a most important problem; and it still remains to be solved.

Sec. 2. We may begin by recalling the distinction between the denotation and connotation of a general term: the denotation comprising the things or events which the term is a name for; the connotation comprising the common qualities on account of which these things are called by the same name. Obviously, there are very few general terms whose denotation is exhaustively known; since the denotation of a general term comprises all the things that have its connotation, or that ever have had, or that ever will have it, whether they exist here, or in Australia, or in the Moon, or in the utmost stars. No one has examined all men, all mammoths, all crystals, all falling bodies, all cases of fever, all revolutions, all stars--nor even all planets, since from time to time new ones are discerned. We have names for animals that existed long before there were men to observe them, and of which we know only a few bones, the remains of multitudinous species; and for others that may continue to exist when men have disappeared from the earth.

If, indeed, we definitely limit the time, or place, or quantity of matter to be explored, we may sometimes learn, within the given limits, all that there is to know: as all the bones of a particular animal, or the list of English monarchs hitherto, or the names of all the members of the House of Commons at the present time. Such cases, however, do not invalidate the above logical truth that few general terms are exhaustively known in their denotation; for the very fact of assigning limits of time and place impairs the generality of a term. The bones of a certain animal may be all examined, but not the bones of all animals, nor even of one species. The English monarchs that have reigned hitherto may be known, but there may be many still to reign.

The general terms, then, with which Logic is chiefly concerned, the names of Causes and Kinds, such as gravitation, diseases, social events, minerals, plants and animals, stand for some facts that are, or have been, known, and for a great many other similar ones that have not been, and never will be, known. The use of a general term depends not upon our direct knowledge of everything comprised in its denotation, but upon our readiness to apply it to anything that has its connotation, whether we have seen the thing or not, and even though we never can perceive it; as when a man talks freely of the ichthyosaurus, or of the central heat of planets, or of atoms and ether.

Hence Universal Propositions, which consist of general terms, deceive us, if we suppose that their predicates are directly known to be related to all the facts denoted by their subjects. In exceptional cases, in which the denotation of a subject is intentionally limited, such exhaustive direct knowledge may be possible; as that "all the bones of a certain animal consist of phosphate of lime," or that every member of the present Parliament wears a silk hat. But what predication is possible concerning the hats of all members of Parliament from the beginning? Ordinarily, then, whilst the relation of predicate to subject has been observed in some cases, in much the greater number of cases our belief about it depends upon something besides observation, or may be said (in a certain sense) to be taken on trust.

'All rabbits are herbivorous': why do we believe that? We may have seen a few wild rabbits feeding: or have kept tame ones, and tried experiments with their diet; or have read of their habits in a book of Natural History; or have studied the anatomy and physiology of the digestive system in many sorts of animals: but with whatever care we add testimony and scientific method to our own observation, it still remains true that the rabbits observed by ourselves and others are few in comparison with those that live, have lived and will live. Similarly of any other universal proposition; that it 'goes beyond the evidence' of direct observation plainly follows from the fact that the general terms, of which such propositions consist, are never exhaustively known in their denotation. What right have we then to state Universal Propositions? That is the problem of Inductive Logic.

Sec. 3. Universal Propositions, of course, cannot always be proved by syllogisms; because to prove a universal proposition by a syllogism, its premises must be universal propositions; and, then, these must be proved by others. This process may sometimes go

a little way, thus: _All men are mortal_, because _All animals are_; and _All animals are mortal_, because _All composite bodies are subject to dissolution._ Were there no limit to such sorites, proof would always involve a _regressus ad infinitum_, for which life is too short; but, in fact, prosyllogisms soon fail us.

Clearly, the form of the Syllogism must itself be misleading if the universal proposition is so: if we think that premises prove the conclusion because they themselves have been established by detailed observation, we are mistaken. The consideration of any example will show this. Suppose any one to argue:

All ruminants are herbivorous; Camels are ruminants: .'. Camels are herbivorous.

Have we, then, examined all ruminants? If so, we must have examined all camels, and cannot need a syllogism to prove their herbivorous nature: instead of the major premise proving the conclusion, the proof of the conclusion must then be part of the proof of the major premise. But if we have not examined all ruminants, having omitted most giraffes, most deer, most oxen, etc., how do we know that the unexamined (say, some camels) are not exceptional? Camels are vicious enough to be carnivorous; and indeed it is said that Bactrian camels will eat flesh rather than starve, though of course their habit is herbivorous.

Or, again, it is sometimes urged that--

All empires decay: .'. Britain will decay.

This is manifestly a prediction: at present Britain flourishes, and shows no signs of decay. Yet a knowledge of its decay seems necessary, to justify any one in asserting the given premise. If it is a question whether Britain will decay, to attempt (while several empires still flourish) to settle the matter by asserting that _all_ empires decay, seems to be 'a begging of the question.' But although this latter case is a manifest prediction, it does not really differ from the former one; for the proof that camels are herbivorous has no limits in time. If valid, it shows not only that they are, but also that they will be, herbivorous.

Hence, to resort to a dilemma, it may be urged: If _all_ the facts of the major premise of any syllogism have been examined, the syllogism is needless; and if _some_ of them have not been examined, it is a _petitio principii_. But either all have been examined, or some have not. Therefore; the syllogism is either useless or fallacious.

Sec. 4. A way of escape from this dilemma is provided by distinguishing between the formal and material aspects of the syllogism considered as a means of proof. It begs the question formally, but not materially; that is to say, if it be a question whether camels are herbivorous, and to decide it we are told that '_all_ ruminants are,' laying stress upon the 'all,' as if all had been examined, though in fact camels have not been, then the question as to camels is begged. The form of a universal proposition is then offered as evidence, when in fact the evidence has not been universally ascertained. But if in urging that 'all ruminants are herbivorous' no more is meant than that so many other ruminants of different species are known to be herbivorous, and that the ruminant stomach is so well adapted to a coarse vegetable diet, that the same habit may be expected in other ruminants, such as camels, the argument then rests upon material evidence without unfairly implying the case in question. Now the nature of the material evidence is plainly this, that the resemblance of camels to deer, oxen, etc., in chewing the cud, justifies us in believing that they have a further resemblance in feeding on herbs; in other words, we assume that _resemblance is a ground of inference_.

Another way of putting this difficulty which we have just been discussing, with regard to syllogistic evidence, is to urge that by the Laws of Syllogism a conclusion must never go beyond the premises, and that therefore no progress in knowledge can ever be established, except by direct observation. Now, taking the syllogism formally, this is true: if the conclusion go beyond the premises, there must be either four terms, or illicit process of the major or minor term. But, taking it materially, the conclusion may cover facts which were not in view when the major premise was laid down; facts of which we predicate something not as the result of direct observation, but because they resemble in a certain way those facts which had been shown to carry the predicate when the major premise was formed.

'What sort of resemblance is a sufficient ground of inference?' is, therefore, the important question alike in material Deduction and in Induction; and in endeavouring to answer it we shall find that the surest ground of inference is resemblance of causation. For example, it is due to causation that ruminants are herbivorous. Their instincts make them crop the herb, and their stomachs enable them easily to digest it; and in these characters camels are like the other ruminants.

Sec. 5. In ch. ix, Sec. 3, the _Dictum de omni et nullo_ was stated: 'Whatever may be predicated of a term distributed may be predicated of anything that can be identified with that term.' Nothing was there said (as nothing was needed) of the relations that

might be implied in the predication. But now that it comes to the ultimate validity of predication, we must be clear as to what these relations are; and it will also be convenient to speak no longer of terms, as in Formal Logic, but of the things denoted. What relations, then, can be determined between concrete facts or phenomena (physical or mental) with the greatest certainty of general truth; and what axioms are there that sanction mediate inferences concerning those relations?

In his _Logic_ (B. II. c. 2, Sec. 3) Mill gives as the axiom of syllogistic reasoning, instead of the _Dictum_: "A thing which co-exists with another thing, which other co-exists with a third thing, also co-exists with that third thing." Thus the peculiar properties of Socrates co-exist with the attributes of man, which co-exist with mortality: therefore, Socrates is mortal. But, again, he says that the ground of the syllogism is Induction; that man is mortal is an induction. And, further, the ground of Induction is causation; the law of causation is the ultimate major premise of every sound induction. Now causation is the principle of the succession of phenomena: how, then, can the syllogism rest on an axiom concerning co-existence? On reflection, too, it must appear that 'Man is mortal' predicates causation: the human constitution issues in death.

The explanation of this inconsistency may perhaps be found in the history of Mill's work. Books I. and II. were written in 1831; but being unable at that time to explain Induction, he did not write Book III. until 1837-8. Then, no doubt, he revised the earlier Books, but not enough to bring his theory of the syllogism into complete agreement with the theory of Induction; so that the axiom of co-existence was allowed to stand.

Mill also introduced the doctrine of Natural Kinds as a ground of Induction supplementary, at least provisionally, to causation; and to reasoning about Kinds, or Substance and Attribute, his axiom of co-existence is really adapted. Kinds are groups of things that agree amongst themselves and differ from all others in a multitude of qualities: these qualities co-exist, or co-inhere, with a high degree of constancy; so that where some are found others may be inferred. Their co-inherence is not to be considered an ultimate fact; for, "since everything which occurs is determined by laws of causation and collocations of the original causes, it follows that the co-existences observable amongst effects cannot themselves be the subject of any similar set of laws distinct from laws of causation" (B. III. c. 5, Sec. 9). According to the theory of evolution (worked out since Mill wrote), Kinds--that is, species of plants, animals and minerals--with their qualities are all due to causation. Still, as we can rarely, or never, trace the causes with any fullness or precision, a great deal of our reasoning, as, e.g., about men and camels, does in fact trust to the relative permanence of natural Kinds as defined by co-inhering attributes.

To see this more clearly, we should consider that causation and natural Kinds are not at present separable; propositions about causation in concrete phenomena (as distinct from abstract 'forces') always involve the assumption of Kinds. For example--'Water rusts iron,' or the oxygen of water combines with iron immersed in it to form rust: this statement of causation assumes that water, oxygen, iron, and iron-rust are known Kinds. On the other hand, the constitution of every concrete thing, and manifestly of every organised body, is always undergoing change, that is, causation, upon which fact its properties depend.

How, then, can we frame principles of mediate reasoning, about such things? So far as we consider them as Kinds, it is enough to say: _Whatever can be identified as a specimen of a known substance or Kind has the properties of that Kind_. So far as we consider them as in the relation of causation, we may say: _Whatever relation of events can be identified with the relation of cause and effect is constant_. And these principles may be generalised thus: _Whatever is constantly related to a phenomenon (cause or Kind), determined by certain characters, is related in the same way to any phenomenon, that has the same characters_. Taking this as axiom of the syllogism materially treated, we see that herbivorousness, being constantly related to ruminants, is constantly related to camels; mortality to man and, therefore, to Socrates; rusting to the immersion of iron in water generally and, therefore, to this piece of iron. _Nota notae, nota rei ipsius_ is another statement of the same principle; still another is Mill's axiom, "Whatever has a mark has what it is a mark of." A mark is anything (A) that is never found without something else (B)--a phenomenon constantly related to another phenomenon--so that wherever A is found, B may be expected: human nature is a mark of mortality.

Sec. 6. The Syllogism has sometimes been discarded by those who have only seen that, as formally stated, it is either useless or fallacious: but those who also perceive its material grounds retain and defend it. In fact, great advantages are gained by stating an argument as a formal syllogism. For, in the first place, we can then examine separately the three conditions on which the validity of the argument depends:

(1) Are the Premises so connected that, _if they are true_, the Conclusion follows? This depends upon the formal principles of chap. x.

(2) Is the Minor Premise true? This question can only arise when the minor premise is a real proposition; and then it may be very difficult to answer. Water rusts iron; but is the metal we are now dealing with a fair specimen of iron? Few people, comparatively, know how to determine whether diamonds, or even gold or silver coins, are genuine. That _Camels are ruminants_ is now a verbal proposition to a Zoologist, but not to the rest of us; and to the Zoologist the ascertaining of the relation in which camels stand to such ruminants as oxen and deer, was not a matter of analysing words but of dissecting specimens. What a long controversy as to whether the human race constitutes a Family of the Primates! That 'the British Empire is an empire' affords no matter for doubt or inquiry; but how difficult to judge whether the British Empire resembles Assyria, Egypt, Rome, Spain in those characters and circumstances that caused their downfall!

(3) Is the Major Premise true? Are all ruminants herbivorous? If there be any exceptions to the rule, camels are likely enough to be among the exceptions. And here the need of Inductive Logic is most conspicuous: how can we prove our premises when they are universal propositions? Universal propositions, however, are also involved in proving the minor premise: to prove a thing to be iron, we must know the constant reactions of iron.

A second advantage of the syllogism is, that it makes us fully aware of what an inference implies. An inference must have some grounds, or else it is a mere prejudice; but whatever the grounds, if sufficient in a particular case, they must be sufficient for all similar cases, they must admit of being generalised; and to generalise the grounds of the inference, is nothing else than to state the major premise. If the evidence is sufficient to justify the argument that camels are herbivorous _because_ they are ruminants, it must also justify the major premise, _All ruminants are herbivorous_; for else the inference cannot really depend merely upon the fact of ruminating. To state our evidence syllogistically, then, must be possible, if the evidence is mediate and of a logical kind; and to state it in this formal way, as depending on the truth of a general principle (the major premise), increases our sense of responsibility for the inference that is thus seen to imply so much; and if any negative instances lie within our knowledge, we are the more likely to remember them. The use of syllogisms therefore tends to strengthen our reasonings.

A third advantage is, that to formulate an accurate generalisation may be useful to others: it is indeed part of the systematic procedure of science. The memoranda of our major premises, or reasons for believing anything, may be referred to by others, and either confirmed or refuted. When such a memorandum is used for further inferences, these inferences are said, in the language of Formal Logic, to be drawn _from_ it, as if the conclusion were contained in our knowledge of the major premise; but, considering the limited extent of the material evidence, it is better to say that the inference is drawn _according to_ the memorandum or major premise, since the grounds of the major premise and of the conclusion are in fact the same (Mill: _Logic_, B. II. c. 3). Inductive proofs may be stated in Syllogisms, and inductive inferences are drawn _according to_ the Law of Causation.

Sec. 7. To assume that resemblance is a ground of inference, and that substance and attribute, or cause and effect, are phenomena constantly related, implies belief in the Uniformity of Nature. The Uniformity of Nature cannot be defined, and is therefore liable to be misunderstood. In many ways Nature seems not to be uniform: there is great variety in the sizes, shapes, colours and all other properties of things: bodies falling in the open air--pebbles, slates, feathers--descend in different lines and at different rates; the wind and weather are proverbially uncertain; the course of trade or of politics, is full of surprises. Yet common maxims, even when absurd, testify to a popular belief that the relations of things are constant: the doctrine of St. Swithin and the rhyme beginning 'Evening red and morning grey,' show that the weather is held to be not wholly unpredictable; as to human affairs, it is said that 'a green Yule makes a fat churchyard,' that 'trade follows the flag,' and that 'history repeats itself'; and Superstition knows that witches cannot enter a stable-door if a horse-shoe is nailed over it, and that the devil cannot cross a threshold inscribed with a perfect pentagram. But the surest proof of a belief in the uniformity of nature is given by the conduct of men and animals; by that adherence to habit, custom and tradition, to which in quiet times they chiefly owe their safety, but which would daily disappoint and destroy them, if it were not generally true that things may be found where they have been left and that in similar circumstances there are similar events.

Now this general belief, seldom distinctly conceived, for the most part quite unconscious (as a principle), merely implied in what men do, is also the foundation of all the Sciences; which are entirely occupied in seeking the Laws (that is, the Uniformities) of Nature. As the uniformity of nature cannot be defined, it cannot be proved; the most convincing evidence in its favour is the steady progress made by Science whilst trusting in it. Nevertheless, what is important is not the comprehensive but indeterminate notion of Uniformity so much as a number of First Principles, which may be distinguished in it as follows:

(1) The Principles of Contradiction and Excluded Middle (ch. vi. Sec. 3) declare that in a given relation to a given phenomenon any two or more other phenomena are incompatible (_B is not A and a_); whilst the given phenomenon either stands related to another

phenomenon or not (_B is either A or a_). It is not only a matter of Logic but of fact that, if a leaf is green, it is not under the same conditions red or blue, and that if it is not green it is some other colour.

(2) Certain Axioms of Mediate Evidence: as, in Mathematics, 'that magnitudes equal to the same magnitude are equal to one another'; and, in Logic, the _Dictum_ or its material equivalent.

(3) That all Times and all Spaces are commensurable; although in certain relations of space (as [pi]) the unit of measurement must be infinitely small.--If Time really trotted with one man and galloped with another, as it seems to; if space really swelled in places, as De Quincey dreamed that it did; life could not be regulated, experience could not be compared and science would be impossible. The Mathematical Axioms would then never be applicable to space or time, or to the objects or processes that fill them.

(4) The Persistence of Matter and Energy: the physical principle that, in all changes of the universe, the quantities of Matter and Energy (actual and potential, so-called) remain the same.--For example, as to matter, although dew is found on the grass at morning without any apparent cause, and although a candle seems to burn away to a scrap of blackened wick, yet every one knows that the dew has been condensed from vapour in the air, and that the candle has only turned into gas and smoke. As to energy, although a stone thrown up to the housetop and resting there has lost actual energy, it has gained such a position that the slightest touch may bring it to the earth again in the same time as it took to travel upwards; so on the house-top it is said to have potential energy. When a boiler works an engine, every time the piston is thrust forward (mechanical energy), an equivalent in heat (molecular energy) is lost. But for the elucidation of these principles, readers must refer to treatises of Chemistry and Physics.

(5) Causation, a special form of the foregoing principles of the persistence of matter and energy, we shall discuss in the next chapter. It is not to be conceived of as anything occult or noumenal, but merely as a special mode of the uniformity of Nature or experience.

(6) Certain Uniformities of Co-existence; but for want of a general principle of Co-existence, corresponding to Causation (the principle of Succession), we can only classify these uniformities as follows:

(a) The Geometrical; as that, in a four-sided figure, if the opposite angles are equal, the opposite sides are equal and parallel.--Countless similar uniformities of co-existence are disclosed by Geometry. The co-existent facts do not cause one another, nor are they jointly caused by something else; they are mutually involved: such is the nature of space.

(b) Universal co-inherences among the properties of concrete things.--The chief example is the co-inherence of gravity with inertia in all material bodies. There is, I believe, no other entirely satisfactory case; but some good approximations to such uniformity are known to physical science.

(c) Co-existence due to Causation; such as the positions of objects in space at any time.--The houses of a town are where they are, because they were put there; and they remain in their place as long as no other causes arise strong enough to remove or destroy them. Similarly, the relative positions of rocks in geological strata, and of trees in a forest, are due to causes.

(d) The co-inherence of properties in Natural Kinds; which we call the constitution, defining characters, or specific nature of such things.--Oxygen, platinum, sulphur and the other elements; water, common salt, alcohol and other compounds; the various species of plants and animals: all these are known to us as different groups of co-inherent properties. It may be conjectured that these groupings of properties are also due to causation, and sometimes the causes can be traced: but very often the causes are still unknown; and, until resolved into their causes, they must be taken as necessary data in the investigation of nature. Laws of the co-inherence of the properties of Kinds do not, like laws of causation, admit of methodical proof upon their own principles, but only by constancy in experience and statistical probability (c. xix, Sec. 4).

(e) There are also a few cases in which properties co-exist in an unaccountable way, without being co-extensive with any one species, genus, or order: as most metals are whitish, and scarlet flowers are wanting in fragrance. (On this Sec. 7, see Venn's _Empirical Logic_, c. 4.)

Sec. 8. Inasmuch as Axioms of Uniformity are ultimate truths, they cannot be deduced; and inasmuch as they are universal, no proof by experience can ever be adequate. The grounds of our belief in them seem to be these:

(1) Every inference takes for granted an order of Nature corresponding with it; and every attempt to explain the origin of anything assumes that it is the transformation of something else: so that uniformity of order and conservation of matter and energy are necessary presuppositions of reasoning.

(2) On the rise of philosophic reflection, these tacit presuppositions are first taken as dogmas, and later as postulates of scientific generalisation, and of the architectonic unification of science. Here they are indispensable.

(3) The presuppositions or postulates are, in some measure, verifiable in practical life and in scientific demonstration, and the better verifiable as our methods become more exact.

(4) There is a cause of this belief that cannot be said to contain any evidence for it, namely, the desire to find in Nature a foundation for confidence in our own power to foresee and to control events.

CHAPTER XIV

CAUSATION

Sec. 1. For the theory of Induction, the specially important aspect of the Uniformity of Nature is Causation.

For (1) the Principles of Contradiction and Excluded Middle are implied in all logical operations, and need no further explication.

(2) That one thing is a mark of another or constantly related to it, must be established by Induction; and the surest of all marks is a Cause. So that the application of the axiom of the Syllogism in particular cases requires, when most valid, a previous appeal to Causation.

(3) The uniformity of Space and of Time is involved in Causation, so far as we conceive Causation as essentially matter in motion--for motion is only known as a traversing of space in time; and so far as forces vary in any way according to the distance between bodies; so that if space and time were not uniform, causation would be irregular. Not that time and space are agents, but they are conditions of every agent's operation.

(4) The persistence of Matter and Energy, being nothing else than Causation in the general movement of the world, is applied under the name of that principle in explaining any particular limited phenomenon, such as a soap-bubble, or a thunderstorm, or the tide.

(5) As to co-existences, the Geometrical do not belong to Logic: those involved in the existence of plants, animals, and inorganic bodies, must, as far as possible, be traced to causes; and so, of course, must the relative positions of objects in space at any time: and what Co-existences remain do not admit of methodical inductive treatment; they will be briefly discussed in chap. xix.

Causation, then, is that mode or aspect of the Uniformity of Nature which especially concerns us in Induction; and we must make it as definite as possible. It is nothing occult, but merely a convenient name for phenomena in a particular relation to other phenomena, called their effect. Similarly, if the word 'force' is sometimes used for convenience in analysing causation, it means nothing more than something in time and space, itself moving, or tending to move, or hindering or accelerating other things. If any one does not find these words convenient for the purpose, he can use others.

Sec. 2. A Cause, according to Mill, is "the invariable unconditional antecedent" of a given phenomenon. To enlarge upon this:

(1) A Cause is _relative to a given phenomenon_, called the Effect. Logic has no method for investigating the cause of the universe as a whole, but only of a part or epoch of it: we select from the infinite continuum of Nature any portion that is neither too large nor too small for a trained mind to comprehend. The magnitude of the phenomenon may be a matter of convenience. If the cause of disease in general be too wide a problem, can fevers be dealt with; or, if that be too much, is typhus within the reach of inquiry? In short, how much can we deal with accurately?

(2) The given phenomenon is always _an event_; that is to say, not a new thing (nothing is wholly new), but a change in something, or in the relative position of things. We may ask the cause of the phases of the moon, of the freezing of water, of the kindling of a match, of a deposit of chalk, of the differentiation of species. To inquire the cause of France being a republic, or Russia an autocracy, implies that these countries were once otherwise governed, or had no government: to inquire the cause of the earth being shaped like an orange, implies that the matter of the earth had once another shape.

(3) The Cause is _antecedent_ to the Effect, which accordingly is often called its _consequent_. This is often misunderstood and sometimes disputed. It has been said that the meaning of 'cause' implies an 'effect,' so that until an effect occurs there can be no cause. But this is a blunder; for whilst the word 'cause' implies 'effect,' it also implies the relative futurity of the effect; and effect

implies the relative priority of the cause. The connotation of the words, therefore, agrees well enough with Mill's doctrine. In fact, the danger is that any pair of contrasted words may suggest too strongly that the phenomena denoted are separate in Nature; whereas every natural process is continuous. If water, dripping from the roof wears away a stone, it fell on the roof as rain; the rain came from a condensing cloud; the cloud was driven by the wind from the sea, whence it exhaled; and so on. There is no known beginning to this, and no break in it. We may take any one of these changes, call it an effect, and ask for its cause; or call it a cause, and ask for its effect. There is not in Nature one set of things called causes and another called effects; but every change is both cause (or a condition) of the future and effect of the past; and whether we consider an event as the one or the other, depends upon the direction of our curiosity or interest.

Still, taking the event as effect, its cause is the antecedent process; or, taking it as a cause, its effect is the consequent process. This follows from the conception of causation as essentially motion; for that _motion takes time_ is (from the way our perceptive powers grow) an ultimate intuition. But, for the same reason, there is no interval of time between cause and effect; since all the time is filled up with motion.

Nor must it be supposed that the whole cause is antecedent to the effect as a whole: for we often take the phenomenon on such a scale that minutes, days, years, ages, may elapse before we consider the cause as exhausted (e.g., an earthquake, a battle, an expansion of credit, natural selection operating on a given variety); and all that time the effect has been accumulating. But we may further consider such a cause as made up of moments or minute factors, and the effect as made up of corresponding moments; and then the cause, taken in its moments, is antecedent throughout to the effect, taken in its corresponding moments.

(4) The Cause is the _invariable_ antecedent of the effect; that is to say, whenever a given cause occurs it always has the same effect: in this, in fact, consists the Uniformity of Causation. Accordingly, not every antecedent of an event is its Cause: to assume that it is so, is the familiar fallacy of arguing '_post hoc ergo propter hoc_.' Every event has an infinite number of antecedents that have no ascertainable connection with it: if a picture falls from the wall in this room, there may have occurred, just previously, an earthquake in New Zealand, an explosion in a Japanese arsenal, a religious riot in India, a political assassination in Russia and a vote of censure in the House of Commons, besides millions of other less noticeable events, between none of which and the falling of the picture can any direct causation be detected; though, no doubt, they are all necessary occurrences in the general world-process, and remotely connected. The cause, however, was that a door slammed violently in the room above and shook the wall, and that the picture was heavy and the cord old and rotten. Even if two events invariably occur one after the other, as day follows night, or as the report follows the flash of a gun, they may not be cause and effect, though it is highly probable that they are closely connected by causation; and in each of these two examples the events are co-effects of a common cause, and may be regarded as elements of its total effect. Still, whilst it is not true that every antecedent, or that every invariable antecedent, of an event is its cause, the cause is conceived of as some change in certain conditions, or some state and process of things, such that should it exactly recur the same event would invariably follow. If we consider the antecedent state and process of things very widely or very minutely, it never does exactly recur; nor does the consequent. But the purpose of induction is to get as near the truth as possible within the limits set by our faculties of observation and calculation. Complex causal instances that are most unlikely to recur as a whole, may be analysed into the laws of their constituent conditions.

(5) The Cause is the Unconditional Antecedent. A cause is never simple, but may be analysed into several conditions; and 'Condition' means any necessary factor of a Cause: any thing or agent that exerts, absorbs, transforms, or deflects energy; or any relation of time or space in which agents stand to one another. A positive condition is one that cannot be omitted without frustrating the effect; a negative condition is one that cannot be introduced without frustrating the effect. In the falling of the picture, e.g., the positive conditions were the picture (as being heavy), the slamming of the door, and the weakness of the cord: a negative condition was that the picture should have no support but the cord. When Mill, then, defines the Cause of any event as its "unconditional" antecedent, he means that it is that group of conditions (state and process of things) which, without any further condition, is followed by the event in question: it is the least antecedent that suffices, positive conditions being present and negative absent.

Whatever item of the antecedent can be left out, then, without affecting the event, is no part of the cause. Earthquakes have happened in New Zealand and votes of censure in the House of Commons without a picture's falling in this room: they were not unconditional antecedents; something else was needed to bring down a picture. Unconditionality also distinguishes a true cause from an invariable antecedent that is only a co-effect: for when day follows night something else happens; the Earth rotates upon her axis: a flash of gunpowder is not an unconditional antecedent of a report; the powder must be ignited in a closed chamber.

By common experience, and more precisely by experiment, it is found possible to select from among the antecedents of an event a certain number upon which, so far as can be perceived, it is dependent, and to neglect the rest: to purge the cause of all irrelevant antecedents is the great art of inductive method. Remote or minute conditions may indeed modify the event in ways so refined as to escape our notice. Subject to the limitations of our human faculties, however, we are able in many cases to secure an unconditional antecedent upon which a certain event invariably follows. Everybody takes this for granted: if the gas will not burn, or a gun will not go off, we wonder 'what can be wrong with it,' that is, what positive condition is wanting, or what negative one is present. No one now supposes that gunnery depends upon those "remotest of all causes," the stars, or upon the sun being in Sagittarius rather than in Aquarius, or that one shoots straightest with a silver bullet, or after saying the alphabet backwards.

(6) That the Cause of any event is an Immediate Antecedent follows from its being an unconditional one. For if there are three events, A B C, causally connected, it is plain that A is not the unconditional antecedent of C, but requires the further condition of first giving rise to B. But that is not all; for the B that gives rise to C is never merely the effect of A; it involves something further. Take such a simple case as the motion of the earth round the sun (neglecting all other conditions, the other planets, etc.); and let the earth's motion at three successive moments be A B C: A is not the whole cause of B in velocity and direction; we must add relation to the sun, say x. But then, again, the cause of C will not be merely Bx, for the relation to the sun will have altered; so that we must represent it as Bx'. The series, therefore, is Ax Bx' C. What is called a "remote cause" is, therefore, doubly conditional; first, because it supposes an intervening cause; and secondly, because it only in part determines the conditions that constitute this intervening cause.

The immediacy of a cause being implied in its unconditionalness, is an important clue to it; but as far as the detection of causes depends upon sense-perception, our powers (however aided by instruments) are unequal to the subtlety of Nature. Between the event and what seems to us the immediate antecedent many things (molecular or etherial changes) may happen in Chemistry or Physics. The progress of science would be impossible were not observation supplemented by hypothesis and calculation. And where phenomena are treated upon a large scale, as in the biological and social sciences, immediacy, as a mark of causation, must be liberally interpreted. So far, then, as to the qualitative character of Causation.

(7) But to complete our account of it, we must briefly consider its quantitative character. As to the Matter contained, and as to the Energy embodied, Cause and Effect are conceived to be _equal_. As to matter, indeed, they may be more properly called identical; since the effect is nothing but the cause redistributed. When oxygen combines with hydrogen to form water, or with mercury to form red precipitate, the weight of the compound is exactly equal to the weight of the elements combined in it; when a shell explodes and knocks down a wall, the materials of the shell and wall are scattered about. As to energy, we see that in the heavenly bodies, which meet with no sensible impediment, it remains the same from age to age: with things 'below the moon' we have to allow for the more or less rapid conversion of the visible motion of a mass into other forms of energy, such as sound and heat. But the right understanding of this point involves physical considerations of some difficulty, as to which the reader must refer to appropriate books, such as Balfour Stewart's on _The Conservation of Energy_.

The comprehension of the quantitative aspect of causation is greatly aided by Bain's analysis of any cause into a 'Moving or an Inciting Power' and a 'Collocation' of circumstances. When a demagogue by making a speech stirs up a mob to a riot, the speech is the moving or inciting power; the mob already in a state of smouldering passion, and a street convenient to be wrecked, are the collocation. When a small quantity of strychnine kills a man, the strychnine is the inciting power; the nature of his nervo-muscular system, apt to be thrown into spasms by that drug, and all the organs of his body dependent on that system, are the collocation. Now any one who thinks only of the speech, or the drug, in these cases, may express astonishment at the disproportion of cause and effect:

"What great events from trivial causes spring!"

But, remembering that the whole cause of the riot included the excited mob, every one sees that its muscular power is enough to wreck a street; and remembering that breathing depends upon the normal action of the intercostal muscles, it is plain that if this action is stopped by strychnine, a man must die. Again, a slight rise of temperature may be a sufficient inciting power to occasion extensive chemical changes in a collocation of elements otherwise stable; a spark is enough to explode a powder magazine. Hence, when sufficient energy to account for any effect cannot be found in the inciting power, or manifestly active condition, we must look for it in the collocation which is often supposed to be passive.

And that reminds us of another common misapprehension, namely, that in Nature some things are passive and others active: the distinction between 'agent' and 'patient.' This is a merely relative distinction: in Nature all things are active. To the eye some things seem at rest and others in motion; but we know that nothing is really at rest, that everything palpitates with molecular change, and whirls with the planet through space. Everything that is acted upon reacts according to its own nature: the quietest-looking object (say, a moss-covered stone), if we try to push or lift it, pushes or pulls us back, assuring us that 'action and reaction are equal and opposite.' 'Inertia' does not mean want of vigour, but may be metaphorically described as the inexpugnable resolve of everything to have its own way.

The equality of cause and effect defines and interprets the unconditionality of causation. The cause, we have seen, is that group of conditions which, without any further condition, is followed by a given event. But how is such a group to be conceived? Unquantified, it admits only of a general description: quantified, it must mean a group of conditions equal to the effect in mass and energy, the essence of the physical world. Apparently, a necessary conception of the human mind: for if a cause seem greater than its effect, we ask what has become of the surplus matter and energy; or if an effect seem greater than its cause, we ask whence the surplus matter and energy has arisen. So convinced of this truth is every experimenter, that if his results present any deviation from it, he always assumes that it is he who has made some mistake or oversight, never that there is indeterminism or discontinuity in Nature.

The transformation of matter and energy, then, is the essence of causation: because it is continuous, causation is immediate; and because in the same circumstances the transformation always follows the same course, a cause has invariably the same effect. If a fire be lit morning after morning in the same grate, with coal, wood, and paper of the same quality and similarly arranged, there will be each day the same flaming of paper, crackling of wood and glowing of coal, followed in about the same time by the same reduction of the whole mass partly to ashes and partly to gases and smoke that have gone up the chimney. The flaming, crackling and glowing are, physically, modes of energy; and the change of materials into gas and ashes is a chemical and physical redistribution: and, if some one be present, he will be aware of all this; and then, besides the physical changes, there will be sensations of light, sound and heat; and these again will be always the same in the same circumstances.

The Cause of any event, then, when exactly ascertainable, has five marks: it is (quantitatively) _equal_ to the effect, and (qualitatively) _the immediate, unconditional, invariable antecedent of the effect_.

Sec. 3. This scientific conception of causation has been developed and rendered definite by the investigations of those physical sciences that can avail themselves of exact experiments and mathematical calculation; and it is there, in Chemistry and Physics, that it is most at home. The conception can indeed be carried into the Biological and Social Sciences, even in its quantitative form, by making the proper allowances. For the limbs of animals are levers, and act upon mechanical principles; and digestion and the aeration of the blood by breathing are partly chemical processes. There is a quantitative relation between the food a man eats and the amount of work he can do. The numbers of any species of plant or animal depend upon the food supply. The value of a country's imports is equal to the value of its exports and of the services it renders to foreigners. But, generally, the less experiment and exact calculation are practicable in any branch of inquiry, the less rigorously can the conception of causation be applied there, the more will its application depend upon the qualitative marks, and the more need there will be to use it judiciously. In every inquiry the greatest possible precision must be aimed at; but it is unreasonable to expect in any case more precise proof than the subject admits of in the existing state of culture.

Wherever mental action is involved, there is a special difficulty in applying the physical notion of causation. For if a Cause be conceived of as matter in motion, a thought, or feeling, or volition can be neither cause nor effect. And since mental action is involved in all social affairs, and in the life of all men and animals, it may seem impossible to interpret social or vital changes according to laws of causation. Still, animals and men are moving bodies; and it is recognised that their thoughts and feelings are so connected with their movements and with the movements of other things acting upon them, that we can judge of one case by another; although the connection is by no means well understood, and the best words (such as all can agree to use) have not yet been found to express even what we know about it. Hence, a regular connection being granted, I have not hesitated, to use biological and social events and the laws of them, to illustrate causation and induction; because, though less exact than chemical or mechanical examples, they are to most people more familiar and interesting.

In practical affairs, it is felt that everything depends upon causation; how to play the fiddle, or sail a yacht, or get one's living, or defeat the enemy. The price of pig-iron six months hence, the prospects of the harvest, the issue in a Coroner's Court, Home Rule and Socialism, are all questions of causation. But, in such cases, the conception of a cause is rarely applied in its full scientific

acceptation, as the unconditional antecedent, or 'all the conditions' (neither more nor less) upon which the event depends. This is not because men of affairs are bad logicians, or incapable of scientific comprehension; for very often the reverse is conspicuously true; but because practical affairs call for promptitude and a decisive seizing upon what is predominantly important. How learn to play the fiddle? "Go to a good teacher." (Then, beginning young enough, with natural aptitude and great diligence, all may be well.) How defeat the enemy? "Be two to one at the critical juncture." (Then, if the men are brave, disciplined, well armed and well fed, there is a good chance of victory.) Will the price of iron improve? "Yes: for the market is oversold": (that is, many have sold iron who have none to deliver, and must at some time buy it back; and that will put up the price--if the stock is not too great, if the demand does not fall off, and if those who have bought what they cannot pay for are not in the meanwhile obliged to sell.) These prompt and decisive judgments (with the parenthetic considerations unexpressed) as to what is the Cause, or predominantly important condition, of any event, are not as good as a scientific estimate of all the conditions, when this can be obtained; but, when time is short, the insight of trained sagacity may be much better than an imperfect theoretical treatment of such problems.

Sec. 4. To regard the Effect of certain antecedents in a narrow selective way, is another common mistake. In the full scientific conception of an Effect it is the sum of the unconditional consequences of a given state and process of things: the consequences immediately flowing from that situation without further conditions. Always to take account of all the consequences of any cause would no doubt be impracticable; still the practical, as well as the scientific interest, often requires that we should enlarge our views of them; and there is no commoner error in private effort or in legislation than to aim at some obvious good, whilst overlooking other consequences of our action, the evil of which may far outweigh that good. An important consequence of eating is to satisfy hunger, and this is the ordinary motive to eat; but it is a poor account of the physiological consequences. An important consequence of firing a gun is the propulsion of the bullet or shell; but there are many other consequences in the whole effect, and one of them is the heating of the barrel, which, accumulating with rapid firing, may at last put the gun out of action. The tides have consequences to shipping and in the wear and tear of the coast that draw every one's attention; but we are told that they also retard the rotation of the earth, and at last may cause it to present always the same face to the sun, and, therefore, to be uninhabitable. Such concurrent consequences of any cause may be called its Co-effects: the Effect being the sum of them.

The neglect to take account of the whole effect (that is, of all the co-effects) in any case of causation is perhaps the reason why many philosophers have maintained the doctrine of a "Plurality of Causes": meaning not that more than one condition is operative in the antecedent of every event (which is true), but that the same event may be due at different times to different antecedents, that in fact there may be _vicarious_ causes. If, however, we take any effect as a whole, this does not seem to be true. A fire may certainly be lit in many ways: with a match or a flint and steel, or by rubbing sticks together, or by a flash of lightning: have we not here a plurality of causes? Not if we take account of the whole effect; for then we shall find it modified in each case according to the difference of the cause. In one case there will be a burnt match, in another a warm flint, in the last a changed state of electrical tension. And similar differences are found in cases of death under different conditions, as stabbing, hanging, cholera; or of shipwreck from explosion, scuttling, tempest. Hence a Coroner's Court expects to find, by examining a corpse, the precise cause of death. In short, if we knew the facts minutely enough, it would be found that there is only one Cause (sum of conditions) for each Effect (sum of co-effects), and that the order of events is as uniform backwards as forwards.

Still, as we are far from knowing events minutely, it is necessary in practical affairs, and even in the more complex and unmanageable scientific investigations, especially those that deal with human life, to acknowledge a possible plurality of causes for any effect. Indeed, forgetfulness of this leads to many rash generalisations; as that 'revolutions always begin in hunger'; or that 'myths are a disease of language.' Then there is great waste of ingenuity in reconciling such propositions with the recalcitrant facts. A scientific method recognises that there may be other causes of effects thus vaguely conceived, and then proceeds to distinguish in each class of effects the peculiarities due to different causes.

Sec. 5. The understanding of the complex nature of Causes and Effects helps us to overcome some other difficulties that perplex the use of these words. We have seen that the true cause is an _immediate_ antecedent; but if the cause is confounded with _one_ of its constituent conditions, it may seem to have long preceded the event which is regarded as its effect. Thus, if one man's death is ascribed to another's desire of revenge, this desire may have been entertained for years before the assassination occurred: similarly, if a shipwreck is ascribed to a sunken reef, the rock was waiting for ages before the ship sailed that way. But, of course, neither the desire of revenge nor the sunken rock was 'the sum of the conditions' on which the one or the other event depended: as soon as this is complete the effect appears.

We have also seen the true effect of any state and process of things is the immediate consequence; but if the effect be confounded with _one_ of its constituent factors, it may seem to long outlive the cessation of the cause. Thus, in nearly every process of human

industry and art, one factor of the effect--a road, a house, a tool, a picture--may, and generally does, remain long after the work has ceased: but such a result is not the whole effect of the operations that produce it. The other factors may be, and some always are, evanescent. In most of such works some heat is produced by hammering or friction, and the labourers are fatigued; but these consequences soon pass off. Hence the effect as a whole only momentarily survives the cause. Consider a pendulum which, having been once set agoing, swings to and fro in an arc, under the joint control of the shaft, gravitation and its own inertia: at every moment its speed and direction change; and each change may be considered as an effect, of which the antecedent change was one condition. In such a case as this, which, though a very simple, is a perfectly fair example of all causation, the duration of either cause or effect is quite insensible: so that, as Dr. Venn says, an Effect, rigorously conceived, is only "the initial tendency" of its Cause.

Sec. 6. Mill contrasted two forms under which causation appears to us: that is to say, the conditions constituting a cause may be modified, or 'intermixed' in the effect, in two ways, which are typified respectively by Mechanical and Chemical action. In mechanical causation, which is found in Astronomy and all branches of Physics, the effects are all reducible to modes of energy, and are therefore commensurable with their causes. They are either directly commensurable, as in the cases treated of in the consideration of the mechanical powers; or, if different forms of energy enter into cause and effect, such as mechanical energy, electrical energy, heat, these different forms are severally reducible to units, between which equivalents have been established. Hence Mill calls this the "homogeneous intermixture of effects," because the antecedents and consequents are fundamentally of the same kind.

In chemical causation, on the other hand, cause and effect (at least, as they present themselves to us) differ in almost every way: in the act of combination the properties of elements (except weight) disappear, and are superseded by others in the compound. If, for example, mercury (a heavy, silvery liquid) be heated in contact with oxygen (a colourless gas), oxide of mercury is formed (red precipitate, which is a powder). This compound presents very different phenomena from those of its elements; and hence Mill called this class of cases "the heteropathic intermixture of effects." Still, in chemical action, the effect is not (in Nature) heterogeneous with the cause: for the weight of a compound is equal to the sum of the weights of the elements that are merged in it; and an equivalence has been ascertained between the energy of chemical combination and the heat, light, etc., produced in the act of combination.

The heteropathic intermixture of effects is also found in organic processes (which, indeed, are partly chemical): as when a man eats bread and milk, and by digestion and assimilation converts them into nerve, muscle and bone. Such phenomena may make us wonder that people should ever have believed that 'effects resemble their causes,' or that 'like produces like.' A dim recognition of the equivalence of cause and effect in respect of matter and motion may have aided the belief; and the resemblance of offspring to parents may have helped: but it is probably a residuum of magical rites; in which to whistle may be regarded as a means of raising the wind, because the wind whistles; and rain-wizards may make a victim shed tears that the clouds also may weep.

Sec. 7. Another consideration arises out of the complex character of causes and effects. When a cause consists of two or more conditions or forces, we may consider what effect any one of them would have if it operated alone, that is to say, its _Tendency_. This is best illustrated by the Parallelogram of Forces: if two forces acting upon a point, but not in the same direction, be represented by straight lines drawn in the direction of the forces, and in length proportional to their magnitudes, these lines, meeting in an angle, represent severally the tendencies of the forces; whilst if the parallelogram be completed on these lines, the diagonal drawn from the point in which they meet represents their _Resultant_ or effect.

Again, considering the tendency of any force if it operated alone, we may say that, when combined with another force (not in the same direction) in any resultant, its tendency is _counteracted_: either partially, when the direction of the resultant is different; or wholly when, the other force being equal and opposite, the resultant is equilibrium. If the two forces be in the same direction, they are merely added together. Counteraction is only one mode of combination; in no case is any force destroyed.

Sometimes the separate tendencies of combined forces can only be theoretically distinguished: as when the motion of a projectile is analysed into a tendency to travel in the straight line of its discharge, and a tendency to fall straight to the ground. But sometimes a tendency can be isolated: as when,--after dropping a feather in some place sheltered from the wind, and watching it drift to and fro, as the air, offering unequal resistances to its uneven surface, counteracts its weight with varying success, until it slowly settles upon the ground,--we take it up and drop it again in a vacuum, when it falls like lead. Here we have the tendency of a certain cause (namely, the relation between the feather and the earth) free from counteraction: and this is called the _Elimination_ of the counteracting circumstances. In this case indeed there is physical elimination; whereas, in the case of a projectile, when we say

that its actual motion is resolvable (neglecting the resistance of the air) into two tendencies, one in the line of discharge, the other earthwards, there is only theoretical elimination of either tendency, considered as counteracting the other; and this is more specifically called the _Resolution_ or Analysis of the total effect into its component conditions. Now, Elimination and Resolution may be said to be the essential process of Induction in the widest sense of the term, as including the combination of Induction with Deduction.

The several conditions constituting any cause, then, by aiding or counteracting one another's tendencies, jointly determine the total effect. Hence, viewed in relation one to another, they may be said to stand in _Reciprocity_ or mutual influence. This relation at any moment is itself one of co-existence, though it is conceived with reference to a possible effect. As Kant says, all substances, as perceived in space at the same time, are in reciprocal activity. And what is true of the world of things at any moment (as connected, say, by gravity), is true of any selected group of circumstances which we regard as the particular cause of any event to come. The use of the concept of reciprocity, then, lies in the analysis of a cause: we must not think of reciprocity as obtaining in the succession of cause and effect, as if the effect could turn back upon its cause; for as the effect arises its cause disappears, and is irrecoverable by Nature or Magic. There are many cases of rhythmic change and of moving equilibria, in which one movement or process produces another, and this produces something closely resembling the former, and so on in long series; as with the swing of a pendulum or the orbit of a planet: but these are series of cause and effect, not of reciprocity.

CHAPTER XV

INDUCTIVE METHOD

Sec. 1. It is necessary to describe briefly the process of investigating laws of causation, not with the notion of teaching any one the Art of Discovery, which each man pursues for himself according to his natural gifts and his experience in the methods of his own science, but merely to cast some light upon the contents of the next few chapters. Logic is here treated as a process of proof; proof supposes that some general proposition or hypothesis has been suggested as requiring proof; and the search for such propositions may spring from scientific curiosity or from practical interests.

We may, as Bain observes (_Logic_: B. iii. ch. 5), desire to detect a process of causation either (1) amidst circumstances that have no influence upon the process but only obscure it; as when, being pleased with a certain scent in a garden, we wish to know from what flower it rises; or, being attracted by the sound of some instrument in an orchestra, we desire to know which it is: or (2) amidst circumstances that alter the effect from what it would have been by the sole operation of some cause; as when the air deflects a falling feather; or in some more complex case, such as a rise or fall of prices that may extend over many years.

To begin with, we must form definite ideas as to what the phenomenon is that we are about to investigate; and in a case of any complexity this is best done by writing a detailed description of it: e.g., to investigate the cause of a recent fall of prices, we must describe exactly the course of the phenomenon, dating the period over which it extends, recording the successive fluctuations of prices, with their maxima and minima, and noting the classes of goods or securities that were more or less affected, etc.

Then the first step of elimination (as Bain further observes) is "to analyse the situation mentally," in the light of analogies suggested by our experience or previous knowledge. Dew, for example, is moisture formed upon the surface of bodies from no apparent source. But two possible sources are easily suggested by common experience: is it deposited from the air, like the moisture upon a mirror when we breathe upon it; or does it exude from the bodies themselves, like gum or turpentine? Or, again, as to a fall of prices, a little experience in business, or knowledge of Economics, readily suggests two possible explanations: either cheaper production in making goods or carrying them; or a scarcity of that in which the purchasing power of the chief commercial nations is directly expressed, namely, gold.

Having thus analysed the situation and considered the possibility of one, two, three, or more possible causes, we fix upon one of them for further investigation; that is to say, we frame an hypothesis that this is the cause. When an effect is given to find its cause, an inquirer nearly always begins his investigations by thus framing an hypothesis as to the cause.

The next step is to try to _verify_ this Hypothesis. This we may sometimes do by _varying the circumstances_ of the phenomenon, according to the Canons of direct Inductive Proof to be discussed in the next chapter; that is to say, by _observing_ or _experimenting_ in such a way as to get rid of or eliminate the obscuring or disturbing conditions. Thus, to find out which flower in a garden gives a certain scent, it is usually enough to rely on observation, going up to the likely flowers one after the other and smelling them: at close quarters, the greater relative intensity of the scent is sufficiently decisive. Or we may resort to a sort of

experiment, plucking a likely flower, as to which we frame the hypothesis (this is the cause), and carrying it to some place where the air is free from conflicting odours. Should observation or experiment disprove our first hypothesis we try a second; and so on until we succeed, or exhaust the known possibilities.

But if the phenomenon is so complex and extensive as a continuous fall of prices, direct observation or experiment is a useless or impossible method; and we must then resort to Deduction; that is, to indirect Induction. If, for example, we take the hypothesis that the fall is due to a scarcity of gold, we must show that there is a scarcity; what effect such a scarcity may be expected to have upon prices from the acknowledged laws of prices, and from the analogy of other cases of an expanded or restricted currency; that this expectation agrees with the statistics of recent commerce: and finally, that the alternative hypothesis that the fall is due to cheaper production is not true; either because there has not been a sufficient cheapening of general production; or because, if there has been, the results to be rationally expected from it are not such as to agree with the statistics of recent commerce. (Ch. xviii.)

But now suppose that, a phenomenon having been suggested for explanation, we are unable at the time to think of any cause--to frame any hypothesis about it; we must then wait for the phenomenon to occur again, and, once more observing its course and accompaniments and trying to recall its antecedents, do our best to conceive an hypothesis, and proceed as before. Thus, in the first great epidemic of influenza, some doctors traced it to a deluge in China, others to a volcanic eruption near Java; some thought it a mild form of Asiatic plague, and others caught a specific microbe. As the disease often recurred, there were fresh opportunities of framing hypotheses; and the microbe was identified.

Again, the investigation may take a different form: given a supposed Cause to find its Effect; e.g., a new chemical element, to find what compounds it forms with other elements; or, the spots on the sun--have they any influence upon our weather?

Here, if the given cause be under control, as a new element may be, it is possible to try experiments with it according to the Canons of Inductive Proof. The inquirer may form some hypothesis or expectation as to the effects, to guide his observation of them, but will be careful not to hold his expectation so confidently as to falsify his observation of what actually happens.

But if the cause be, like the sun-spots, not under control, the inquirer will watch on all sides what events follow their appearance and development; he must watch for consequences of the new cause he is studying in many different circumstances, that his observations may satisfy the canons of proof. But he will also resort for guidance to deduction; arguing from the nature of the cause, if anything is known of its nature, what consequences may be expected, and comparing the results of this deduction with any consequent which he suspects to be connected with the cause. And if the results of deduction and observation agree, he will still consider whether the facts observed may not be due to some other cause.

A cause, however, may be under control and yet be too dangerous to experiment with; such as the effects of a poison--though, if too dangerous to experiment with upon man, it may be tried upon animals; or such as a proposed change of the constitution by legislation; or even some minor Act of Parliament, for altering the Poor Law, or regulating the hours of labour. Here the first step must be deductive. We must ask what consequences are to be expected from the nature of the change (comparing it with similar changes), and from the laws of the special circumstances in which it is to operate? And sometimes we may partially verify our deduction by trying experiments upon a small scale or in a mild form. There are conflicting deductions as to the probable effect of giving Home Rule to Ireland; and experiments have been made in more or less similar cases, as in the Colonies and in some foreign countries. As to the proposal to make eight hours the legal limit of a day's labour in all trades, we have all tried to forecast the consequences of this; and by way of verification we might begin with nine hours; or we might induce some other country to try the experiment first. Still, no verification by experiments on a small scale, or in a mild form, or in somewhat similar yet different circumstances, can be considered logically conclusive. What proofs are conclusive we shall see in the following chapters.

Sec. 2. To begin with the conditions of direct Induction.--An Induction is an universal real proposition, based on observation, in reliance on the uniformity of Nature: when well ascertained, it is called a Law. Thus, that all life depends on the presence of oxygen is (1) an universal proposition; (2) a real one, since the 'presence of oxygen' is not connoted by 'life'; (3) it is based on observation; (4) it relies on the uniformity of Nature, since all cases of life have not been examined.

Such a proposition is here called 'an induction,' when it is inductively proved; that is, proved by facts, not merely deduced from more general premises (except the premise of Nature's uniformity): and by the 'process of induction' is meant the method of inductive proof. The phrase 'process of induction' is often used in another sense, namely for the inference or judgment by which such propositions are arrived at. But it is better to call this 'the process of hypothesis,' and to regard it as a preliminary to the process of induction (that is, proof), as furnishing the hypothesis which, if it can stand the proper tests, becomes an induction or

law.

Sec. 3. Inductive proofs are usually classed as Perfect and Imperfect. They are said to be perfect when all the instances within the scope of the given proposition have been severally examined, and the proposition has been found true in each case. But we have seen (chap. xiii. Sec. 2) that the instances included in universal propositions concerning Causes and Kinds cannot be exhaustively examined: we do not know all planets, all heat, all liquids, all life, etc.; and we never can, since a man's life is never long enough. It is only where the conditions of time, place, etc., are arbitrarily limited that examination can be exhaustive. Perfect induction might show (say) that every member of the present House of Commons has two Christian names. Such an argument is sometimes exhibited as a Syllogism in Darapti with a Minor premise in U., which legitimates a Conclusion in A., thus:

A.B. to Z have two Christian names; A.B. to Z are all the present M.P.'s: .'. All the present M.P.'s have two Christian names.

But in such an investigation there is no need of logical method to find the major premise; it is mere counting: and to carry out the syllogism is a hollow formality. Accordingly, our definition of Induction excludes the kind unfortunately called Perfect, by including in the notion of Induction a reliance on the uniformity of Nature; for this would be superfluous if every instance in question had been severally examined. Imperfect Induction, then, is what we have to deal with: the method of showing the credibility of an universal real proposition by an examination of _some_ of the instances it includes, generally a small fraction of them.

Sec. 4. Imperfect Induction is either Methodical or Immethodical. Now, Method is procedure upon a principle; and if the method is to be precise and conclusive, the principle must be clear and definite.

There is a Geometrical Method, because the axioms of Geometry are clear and definite, and by their means, with the aid of definitions, laws are deduced of the equality of lines and angles and other relations of position and magnitude in space. The process of proof is purely Deductive (the axioms and definitions being granted). Diagrams are used not as facts for observation, but merely to fix our attention in following the general argument; so that it matters little how badly they are drawn, as long as their divergence from the conditions of the proposition to be proved is not distracting. Even the appeal to "superposition" to prove the equality of magnitudes (as in Euclid I. 4), is not an appeal to observation, but to our judgment of what is implied in the foregoing conditions. Hence no inference is required from the special case to all similar ones; for they are all proved at once.

There is also, as we have seen, a method of Deductive Logic resting on the Principles of Consistency and the _Dictum de omni et nullo_. And we shall find that there is a method of Inductive Logic, resting on the principle of Causation.

But there are a good many general propositions, more or less trustworthy within a certain range of conditions, which cannot be methodically proved for want of a precise principle by which they may be tested; and they, therefore, depend upon Immethodical Induction, that is, upon the examination of as many instances as can be found, relying for the rest upon the undefinable principle of the Uniformity of Nature, since we are not able to connect them with any of its definite modes enumerated in chap. xiii. Sec. 7. To this subject we shall return in chap. xix., after treating of Methodical Induction, or the means of determining that a relation of events is of the nature of cause and effect, because the relation can be shown to have the marks of causation, or some of them.

Sec. 5. Observations and Experiments are the _material_ grounds of Induction. An experiment is an observation made under prepared, and therefore known, conditions; and, when obtainable, it is much to be preferred. Simple observation shows that the burning of the fire depends, for one thing, on the supply of air; but it cannot show us that it depends on oxygen. To prove this we must make experiments as by obtaining pure oxygen and pure nitrogen (which, mixed in the proportion of one to four, form the air) in separate vessels, and then plunging a burning taper into the oxygen--when it will blaze fiercely; and again plunging it into the nitrogen--when it will be extinguished. This shows that the greater part of the air does nothing to keep the fire alight, except by diminishing its intensity and so making it last longer. Experiments are more perfect the more carefully they are prepared, and the more completely the conditions are known under which the given phenomenon is to be observed. Therefore, they become possible only when some knowledge has already been gained by observation; for else the preparation which they require could not be made.

Observation, then, was the first material ground of Induction, and in some sciences it remains the chief ground. The heavenly bodies, the winds and tides, the strata of the earth, and the movements of history, are beyond our power to experiment with. Experiments upon the living body or mind are indeed resorted to when practicable, even in the case of man, as now in all departments of Psychology; but, if of a grave nature, they are usually thought unjustifiable. And in political affairs experiments are hindered by the reflection, that those whose interests are affected must bear the consequences and may resent them. Hence, it is

in physical and chemical inquiries and in the physiology of plants and animals (under certain conditions) that direct experiment is most constantly practised.

Where direct experiment is possible, however, it has many advantages over unaided observation. If one experiment does not enable us to observe the phenomenon satisfactorily, we may try again and again; whereas the mere observer, who wishes to study the bright spots on Mars, or a commercial crisis, must wait for a favourable opportunity. Again, in making experiments we can vary the conditions of the phenomenon, so as to observe its different behaviour in each case; whereas he who depends solely on observation must trust the bounty of nature to supply him with a suitable diversity of instances. It is a particular advantage of experiment that a phenomenon may sometimes be 'isolated,' that is, removed from the influence of all agents except that whose operation we desire to observe, or except those whose operation is already known: whereas a simple observer, who has no control over the conditions of the subject he studies, can never be quite sure that its movements or changes are not due to causes that have never been conspicuous enough to draw his attention. Finally, experiment enables us to observe coolly and circumspectly and to be precise as to what happens, the time of its occurrence, the order of successive events, their duration, intensity and extent.

But whether we proceed by observation or experiment, the utmost attainable exactness of measurements and calculation is requisite; and these presuppose some Unit, in multiples or divisions of which the result may be expressed. This unit cannot be an abstract number as in Arithmetic, but must be one something--an hour, or a yard, or a pound--according to the nature of the phenomenon to be measured. But what is an hour, or a yard or a pound? There must in each case be some constant Standard of reference to give assurance that the unit may always have the same value. "The English pound is defined by a certain lump of platinum preserved at Westminster." The unit may be identical with the standard or some division or multiple of it; and, in measuring the same kind of phenomena, different units may be used for different purposes as long as each bears a constant relation to the standard. Thus, taking the rotation of the earth as the standard of Time, the convenient unit for long periods is a year (which is a multiple); for shorter periods, a day (which is identical); for shorter still, an hour (which is a division), or a second, or a thousandth of a second. (See Jevons' _Principles of Science_, ch. 14.)

Sec. 6. The principle of Causation is the _formal_ ground of Induction; and the Inductive Canons derived from it are means of testing the formal sufficiency of observations to justify the statement of a Law. If we can observe the process of cause and effect in nature we may generalise our observation into a law, because that process is invariable. First, then, can we observe the course of cause and effect? Our power to do so is limited by the refinement of our senses aided by instruments, such as lenses, thermometers, balances, etc. If the causal process is essentially molecular change, as in the maintenance of combustion by oxygen, we cannot directly observe it; if the process is partly cerebral or mental, as in social movements which depend on feeling and opinion, it can but remotely be inferred; even if the process is a collision of moving masses (billiard-balls), we cannot really observe what happens, the elastic yielding, and recoil and the internal changes that result; though no doubt photography will throw some light upon this, as it has done upon the galloping of horses and the impact of projectiles. Direct observation is limited to the effect which any change in a phenomenon (or its index) produces upon our senses; and what we believe to be the causal process is a matter of inference and calculation. The meagre and abstract outlines of Inductive Logic are apt to foster the notion, that the evidence on which Science rests is simple; but it is amazingly intricate and cumulative.

Secondly, so far as we can observe the process of nature, how shall we judge whether a true causal instance, a relation of cause and effect, is before us? By looking for the five marks of Causation. Thus, in the experiment above described, showing that oxygen supports combustion, we find--(1) that the taper which only glowed before being plunged into the oxygen, bursts into flame when there--Sequence; (2) that this begins to happen at once without perceptible interval--Immediacy; (3) that no other agent or disturbing circumstance was present (the preparation of the experiment having excluded any such thing)--Unconditionalness; (4) the experiment may be repeated as often as we like with the same result--Invariableness. Invariableness, indeed, I do not regard as formally necessary to be shown, supposing the other marks to be clear; for it can only be proved within our experience; and the very object of Induction is to find grounds of belief beyond actual experience. However, for material assurance, to guard against his own liability to error, the inquirer will of course repeat his experiments.

The above four are the qualitative marks of Causation: the fifth and quantitative mark is the Equality of Cause and Effect; and this, in the above example, the Chemist determines by showing that, instead of the oxygen and wax that have disappeared during combustion, an equivalent weight of carbon dioxide, water, etc., has been formed.

Here, then, we have all the marks of causation; but in the ordinary judgments of life, in history, politics, criticism, business, we must not expect such clear and direct proofs; in subsequent chapters it will appear how different kinds of evidence are combined in different departments of investigation.

Sec. 7. The Inductive Canons, to be explained in the next chapter, describe the character of observations and experiments that justify us in drawing conclusions about causation; and, as we have mentioned, they are derived from the principle of Causation itself. According to that principle, cause and effect are invariably, immediately and unconditionally antecedent and consequent, and are equal as to the matter and energy embodied.

Invariability can only be observed, in any of the methods of induction, by collecting more and more instances, or repeating experiments. Of course it can never be exhaustively observed.

Immediacy, too, in direct Induction, is a matter for observation the most exact that is possible.

Succession, or the relation itself of antecedent and consequent, must either be directly observed (or some index of it); or else ascertained by showing that energy gained by one phenomenon has been lost by another, for this implies succession.

But to determine the unconditionality of causation, or the indispensability of some condition, is the great object of the methods, and for that purpose the meaning of unconditionality may be further explicated by the following rules for the determination of a Cause.

A. QUALITATIVE DETERMINATION

I.--For Positive Instances.

To prove a supposed Cause: (a) Any agent whose introduction among certain conditions (without further change) is followed by a given phenomenon; or, (b) whose removal is followed by the cessation (or modification) of that phenomenon, is (so far) the cause or an indispensable condition of it.

To find the Effect: (c) Any event that follows a given phenomenon, when there is no further change; or, (d) that does not occur when the conditions of a former occurrence are exactly the same, except for the absence of that phenomenon, is the effect of it (or is dependent on it).

II.--For Negative Instances.

To exclude a supposed Cause: (a) Any agent that can be introduced among certain conditions without being followed by a given phenomenon (or that is found without that phenomenon); or (b) that can be removed when that phenomenon is present without impairing it (or that is absent when that phenomenon is present), is not the cause, or does not complete the cause, of that phenomenon in those circumstances.

To exclude a supposed Effect: (c) Any event that occurs without the introduction (or presence) of a given phenomenon; or (d) that does not occur when that phenomenon is introduced (or is present), is not the effect of that phenomenon.

* * * * *

Subject to the conditions thus stated, the rules may be briefly put as follows:

I. (a) That which (without further change) is followed by a given event is its cause.

II. (a) That which is not so followed is not the cause.

I. (b) That which cannot be left out without impairing a phenomenon is a condition of it.

II. (b) That which can be left out is not a condition of it.

B. QUANTITATIVE DETERMINATION

The Equality of Cause and Effect may be further explained by these rules:

III. (a) When a cause (or effect) increases or decreases, so does its effect (or cause).

III. (b) If two phenomena, having the other marks of cause and effect, seem unequal, the less contains an unexplored factor.

III. (c) If an antecedent and consequent do not increase or decrease correspondingly, they are not cause and effect, so far as they vary.

It will next be shown that these propositions are variously combined in Mill's five Canons of Induction: Agreement, the Joint Method, Difference, Variations, Residues. The first three are sometimes called Qualitative Methods, and the two last Quantitative; and although this grouping is not quite accurate, seeing that Difference is often used quantitatively, yet it draws attention to an important distinction between a mere description of conditions and determination by exact measurement.

To avoid certain misunderstandings, some slight alterations have been made in the wording of the Canons. It may seem questionable whether the Canons add anything to the above propositions: I think they do. They are not discussed in the ensuing chapter merely out of reverence for Mill, or regard for a nascent tradition; but because, as describing the character of observations and experiments that justify us in drawing conclusions about causation, they are guides to the analysis of observations and to the preparation of experiments. To many eminent investigators the Canons (as such) have been unknown; but they prepared their work effectively so far only as they had definite ideas to the same purport. A definite conception of the conditions of proof is the necessary antecedent of whatever preparations may be made for proving anything.

CHAPTER XVI

THE CANONS OF DIRECT INDUCTION

Sec. 1. Let me begin by borrowing an example from Bain (_Logic_: B. III. c. 6). The North-East wind is generally detested in this country: as long as it blows few people feel at their best. Occasional well-known causes of a wind being injurious are violence, excessive heat or cold, excessive dryness or moisture, electrical condition, the being laden with dust or exhalations. Let the hypothesis be that the last is the cause of the North-East wind's unwholesome quality; since we know it is a ground current setting from the pole toward the equator and bent westward by the rotation of the earth; so that, reaching us over thousands of miles of land, it may well be fraught with dust, effluvia, and microbes. Now, examining many cases of North-East wind, we find that this is the only circumstance in which all the instances agree: for it is sometimes cold, sometimes hot; generally dry, but sometimes wet; sometimes light, sometimes violent, and of all electrical conditions. Each of the other circumstances, then, can be omitted without the N.E. wind ceasing to be noxious; but one circumstance is never absent, namely, that it is a ground current. That circumstance, therefore, is probably the cause of its injuriousness. This case illustrates:--

(I) THE CANON OF AGREEMENT.

If two or more instances of a phenomenon under investigation have only one other circumstance (antecedent or consequent) in common, that circumstance is probably the cause (or an indispensable condition) or the effect of the phenomenon, or is connected with it by causation.

This rule of proof (so far as it is used to establish direct causation) depends, first, upon observation of an invariable connection between the given phenomenon and one other circumstance; and, secondly, upon I. (a) and II. (b) among the propositions obtained from the unconditionality of causation at the close of the last chapter.

To prove that A is causally related to _p_, suppose two instances of the occurrence of A, an antecedent, and _p_, a consequent, with concomitant facts or events--and let us represent them thus:

Antecedents: A B C A D E Consequents: _p q r_ _p s t_;

and suppose further that, in this case, the immediate succession of events can be observed. Then A is probably the cause, or an indispensable condition, of _p_. For, as far as our instances go, A is the invariable antecedent of _p_; and _p_ is the invariable consequent of A. But the two instances of A or _p_ agree in no other circumstance. Therefore A is (or completes) the unconditional antecedent of _p_. For B and C are not indispensable conditions of _p_, being absent in the second instance (Rule II. (b)); nor are D and E, being absent in the first instance. Moreover, _q_ and _r_ are not effects of A, being absent in the second instance (Rule II. (d)); nor are _s_ and _t_, being absent in the first instance.

It should be observed that the cogency of the proof depends entirely upon its tending to show the unconditionality of the sequence A-_p_, or the indispensability of A as a condition of _p_. That _p_ follows A, even immediately, is nothing by itself: if a man sits down to study and, on the instant, a hand-organ begins under his window, he must not infer malice in the musician: thousands of

things follow one another every moment without traceable connection; and this we call 'accidental.' Even invariable sequence is not enough to prove direct causation; for, in our experience does not night invariable follow day? The proof requires that the instances be such as to show not merely what events _are_ in invariable sequence, but also what _are not_. From among the occasional antecedents of _p_ (or consequents of A) we have to eliminate the accidental ones. And this is done by finding or making 'negative instances' in respect of each of them. Thus the instance

A D E _p s t_

is a negative instance of B and C considered as supposable causes of _p_ (and of _q_ and _r_ as supposable effects of A); for it shows that they are absent when _p_ (or A) is present.

To insist upon the cogency of 'negative instances' was Bacon's great contribution to Inductive Logic. If we neglect them, and merely collect examples of the sequence A-_p_, this is 'simple enumeration'; and although simple enumeration, when the instances of agreement are numerous enough, may give rise to a strong belief in the connection of phenomena, yet it can never be a methodical or logical proof of causation, since it does not indicate the unconditionalness of the sequence. For simple enumeration of the sequence A-_p_ leaves open the possibility that, besides A, there is always some other antecedent of _p_, say X; and then X may be the cause of _p_. To disprove it, we must find, or make, a negative instance of X--where _p_ occurs, but X is absent.

So far as we recognise the possibility of a plurality of causes, this method of Agreement cannot be quite satisfactory. For then, in such instances as the above, although D is absent in the first, and B in the second, it does not follow that they are not the causes of _p_; for they may be alternative causes: B may have produced _p_ in the first instance, and D in the second; A being in both cases an accidental circumstance in relation to _p_. To remedy this shortcoming by the method of Agreement itself, the only course is to find more instances of _p_. We may never find a negative instance of A; and, if not, the probability that A is the cause of _p_ increases with the number of instances. But if there be no antecedent that we cannot sometimes exclude, yet the collection of instances will probably give at last all the causes of _p_; and by finding the proportion of instances in which A, B, or X precedes _p_, we may estimate the probability of any one of them being the cause of _p_ in any given case of its occurrence.

But this is not enough. Since there cannot really be vicarious causes, we must define the effect (_p_) more strictly, and examine the cases to find whether there may not be varieties of _p_, with each of which one of the apparent causes is correlated: A with _p_^{1} B with _p_^{11}, X with _p_^{111}. Or, again, it may be that none of the recognised antecedents is effective: as we here depend solely on observation, the true conditions may be so recondite and disguised by other phenomena as to have escaped our scrutiny. This may happen even when we suppose that the chief condition has been isolated: the drinking of foul water was long believed to cause dysentery, because it was a frequent antecedent; whilst observation had overlooked the bacillus, which was the indispensable condition.

Again, though we have assumed that, in the instances supposed above, immediate sequence is observable, yet in many cases it may not be so, if we rely only on the canon of Agreement; if instances cannot be obtained by experiment, and we have to depend on observation. The phenomena may then be so mixed together that A and _p_ seem to be merely concomitant; so that, though connection of some sort may be rendered highly probable, we may not be able to say which is cause and which is effect. We must then try (as Bain says) to trace the expenditure of energy: if _p_ gains when A loses, the course of events if from A to _p_.

Moreover, where succession cannot be traced, the method of Agreement may point to a connection between two or more facts (perhaps as co-effects of a remote cause) where direct causation seems to be out of the question: e.g., that Negroes, though of different tribes, different localities, customs, etc., are prognathous, woolly-haired and dolichocephalic.

The Method of Agreement, then, cannot by itself prove causation. Its chief use (as Mill says) is to suggest hypotheses as to the cause; which must then be used (if possible) experimentally to try if it produces the given effect. A bacillus, for example, being always found with a certain disease, is probably the chief condition of it: give it to a guinea-pig, and observe whether the disease appears in that animal.

Men often use arguments which, if they knew it, might be shown to conform more or less to this canon; for they collect many instances to show that two events are connected; but usually neglect to bring out the negative side of the proof; so that their arguments only amount to simple enumeration. Thus Ascham in his _Toxophilus_, insisting on the national importance of archery, argues that victory has always depended on superiority in shooting; and, to prove it, he shows how the Parthians checked the Romans, Sesostris conquered a great part of the known world, Tiberius overcame Arminius, the Turks established their empire,

and the English defeated the French (with many like examples)--all by superior archery. But having cited these cases to his purpose, he is content; whereas he might have greatly strengthened his proof by showing how one or the other instance excludes other possible causes of success. Thus: the cause was not discipline, for the Romans were better disciplined than the Parthians; nor yet the boasted superiority of a northern habitat, for Sesostris issued from the south; nor better manhood, for here the Germans probably had the advantage of the Romans; nor superior civilisation, for the Turks were less civilised than most of those they conquered; nor numbers, nor even a good cause, for the French were more numerous than the English, and were shamefully attacked by Henry V. on their own soil. Many an argument from simple enumeration may thus be turned into an induction of greater plausibility according to the Canon of Agreement.

Still, in the above case, the effect (victory) is so vaguely conceived, that a plurality of causes must be allowed for: although, e.g., discipline did not enable the Romans to conquer the Parthians, it may have been their chief advantage over the Germans; and it was certainly important to the English under Henry V. in their war with the French.

Here is another argument, somewhat similar to the above, put forward by H. Spencer with a full consciousness of its logical character. States that make war their chief object, he says, assume a certain type of organisation, involving the growth of the warrior class and the treatment of labourers as existing solely to sustain the warriors; the complete subordination of individuals to the will of the despotic soldier-king, their property, liberty and life being at the service of the State; the regimentation of society not only for military but also for civil purposes; the suppression of all private associations, etc. This is the case in Dahomey and in Russia, and it was so at Sparta, in Egypt, and in the empire of the Yncas. But the similarity of organisation in these States cannot have been due to race, for they are all of different races; nor to size, for some are small, some large; nor to climate or other circumstances of habitat, for here again they differ widely: the one thing they have in common is the military purpose; and this, therefore, must be the cause of their similar organisation. (_Political Institutions._)

By this method, then, to prove that one thing is causally connected with another, say A with _p_, we show, first, that in all instances of _p_, A is present; and, secondly, that any other supposable cause of _p_ may be absent without disturbing _p_. We next come to a method the use of which greatly strengthens the foregoing, by showing that where _p_ is absent A is also absent, and (if possible) that A is the only supposable cause that is always absent along with _p_.

Sec. 2. THE CANON OF THE JOINT METHOD OF AGREEMENT IN PRESENCE AND IN ABSENCE.

_If_ (1) _two or more instances in which a phenomenon occurs have only one other circumstance (antecedent or consequent) in common, while_ (2) _two or more instances in which it does not occur (though in important points they resemble the former set of instances) have nothing else in common save the absence of that circumstance--the circumstance in which alone the two sets of instances differ throughout (being present in the first set and absent in the second) is probably the effect, or the cause, or an indispensable condition of the phenomenon._

The first clause of this Canon is the same as that of the method of Agreement, and its significance depends upon the same propositions concerning causation. The second clause, relating to instances in which the phenomenon is absent, depends for its probative force upon Prop. II. (a), and I. (b): its function is to exclude certain circumstances (whose nature or manner of occurrence gives them some claim to consideration) from the list of possible causes (or effects) of the phenomenon investigated. It might have been better to state this second clause separately as the Canon of the Method of Exclusions.

To prove that A is causally related to _p_, let the two sets of instances be represented as follows:

Instances of Presence. Instances of Absence. A B C C H F _p q r_ _r x v_ A D E B D K _p s t_ _q y s_ A F G E G M _p u v_ _t f u_

Then A is probably the cause or a condition of _p_, or _p_ is dependent upon A: first, by the Canon of Agreement in Presence, as represented by the first set of instances; and, secondly, by Agreement in Absence in the second set of instances. For there we see that C, H, F, B, D, K, E, G, M occur without the phenomenon _p_, and therefore (by Prop. II. (a)) are not its cause, or not the whole cause, unless they have been counteracted (which is a point for further investigation). We also see that _r, v, q, s, t, u_ occur without A, and therefore are not the effects of A. And, further, if the negative instances represent all possible cases, we see that (according to Prop. I. (b)) A is the cause of _p_, because it cannot be omitted without the cessation of _p_. The inference that A and _p_ are cause and effect, suggested by their being present throughout the first set of instances, is therefore strengthened by their being both absent throughout the second set.

So far as this Double Method, like the Single Method of Agreement, relies on observation, sequence may not be perceptible in the instances observed, and then, direct causation cannot be proved by it, but only the probability of causal connection; and, again, the real cause, though present, may be so obscure as to evade observation. It has, however, one peculiar advantage, namely, that if the second list of instances (in which the phenomenon and its supposed antecedent are both absent) can be made exhaustive, it precludes any hypothesis of a plurality of causes; since all possible antecedents will have been included in this list without producing the phenomenon. Thus, in the above symbolic example, taking the first set of instances, the supposition is left open that B, C, D, E, F, G may, at one time or another, have been a condition of _p_; but, in the second list, these antecedents all occur, here or there, without producing _p_, and therefore (unless counteracted somehow) cannot be a condition of _p_. A, then, stands out as the one thing that is present whenever _p_ is present, and absent whenever _p_ is absent.

Stated in this abstract way, the Double Method may seem very elaborate and difficult; yet, in fact, its use may be very simple. Tyndall, to prove that dispersed light in the air is due to motes, showed by a number of cases (1) that any gas containing motes is luminous; (2) that air in which the motes had been destroyed by heat, and any gas so prepared as to exclude motes, are not luminous. All the instances are of gases, and the result is: motes--luminosity; no motes--no luminosity. Darwin, to show that cross-fertilisation is favourable to flowers, placed a net about 100 flower-heads, and left 100 others of the same varieties exposed to the bees: the former bore no seed, the latter nearly 3,000. We must assume that, in Darwin's judgment, the net did not screen the flowers from light and heat sufficiently to affect the result.

There are instructive applications of this Double Method in Wallace's _Darwinism_. In chap. viii., on _Colour in Animals_, he observes, that the usefulness of their coloration to animals is shown by the fact that, "as a rule, colour and marking are constant in each species of wild animal, while, in almost every domesticated animal, there arises great variability. We see this in our horses and cattle, our dogs and cats, our pigeons and poultry. Now the essential difference between the conditions of life of domesticated and wild animals is, that the former are protected by man, while the latter have to protect themselves." Wild animals protect themselves by acquiring qualities adapted to their mode of life; and coloration is a very important one, its chief, though not its only use, being concealment. Hence a useful coloration having been established in any species, individuals that occasionally may vary from it, will generally, perish; whilst, among domestic animals, variation of colour or marking is subject to no check except the taste of owners. We have, then, two lists of instances; first, innumerable species of wild animals in which the coloration is constant and which depend upon their own qualities for existence; secondly, several species of domestic animals in which the coloration is _not_ constant, and which do _not_ depend upon their own qualities for existence. In the former list two circumstances are present together (under all sorts of conditions); in the latter they are absent together. The argument may be further strengthened by adding a third list, parallel to the first, comprising domestic animals in which coloration is approximately constant, but where (as we know) it is made a condition of existence by owners, who only breed from those specimens that come up to a certain standard of coloration.

Wallace goes on to discuss the colouring of arctic animals. In the arctic regions, he says, some animals are wholly white all the year round, such as the polar bear, the American polar hare, the snowy owl and the Greenland falcon: these live amidst almost perpetual snow. Others, that live where the snow melts in summer, only turn white in winter, such as the arctic hare, the arctic fox, the ermine and the ptarmigan. In all these cases the white colouring is useful, concealing the herbivores from their enemies, and also the carnivores in approaching their prey; this usefulness, therefore, is a condition of the white colouring. Two other explanations have, however, been suggested: first, that the prevalent white of the arctic regions directly colours the animals, either by some photographic or chemical action on the skin, or by a reflex action through vision (as in the chameleon); secondly, that a white skin checks radiation and keeps the animals warm. But there are some exceptions to the rule of white colouring in arctic animals which refute these hypotheses, and confirm the author's. The sable remains brown throughout the winter; but it frequents trees, with whose bark its colour assimilates. The musk-sheep is brown and conspicuous; but it is gregarious, and its safety depends upon its ability to recognise its kind and keep with the herd. The raven is always black; but it fears no enemy and feeds on carrion, and therefore does not need concealment for either defence or attack. The colour of the sable, then, though not white, serves for concealment; the colour of the musk-sheep serves a purpose more important than concealment; the raven needs no concealment. There are thus two sets of instances:--in one set the animals are white (a) all the year, (b) in winter; and white conceals them (a) all the year, (b) in winter; in the other set, the animals are _not_ white, and to them either whiteness would _not_ give concealment, or concealment would _not_ be advantageous. And this second list refutes the rival hypotheses: for the sable, the musk-sheep and the raven are as much exposed to the glare of the snow, and to the cold, as the other animals are.

Sec. 3. THE CANON OF DIFFERENCE.

If an instance in which a phenomenon occurs, and an instance in which it does not occur, have every other circumstance in common save one, that one (whether consequent or antecedent) occurring only in the former; the circumstance in which alone the two instances differ is the effect, or the cause, or an indispensable condition of the phenomenon.

This follows from Props. I (a) and (b), in chapter xv. Sec. 7. To prove that A is a condition of _p_, let two instances, such as the Canon requires, be represented thus:

A B C B C _p q r_ _q r_

Then A is the cause or a condition of _p_. For, in the first instance, A being introduced (without further change), _p_ arises (Prop. I. (a)); and, in the second instance, A having been removed (without other change), _p_ disappears (Prop. I. (b)). Similarly we may prove, by the same instances, that _p_ is the effect of A.

The order of the phenomena and the immediacy of their connection is a matter for observation, aided by whatever instruments and methods of inspection and measurement may be available.

As to the invariability of the connection, it may of course be tested by collecting more instances or making more experiments; but it has been maintained, that a single perfect experiment according to this method is sufficient to prove causation, and therefore implies invariability (since causation is uniform), though no other instances should ever be obtainable; because it establishes once for all the unconditionality of the connection

A B C _p q r_.

Now, formally this is true; but in any actual investigation how shall we decide what is a satisfactory or perfect experiment? Such an experiment requires that in the negative instance

B C _q r_,

BC shall be the least assemblage of conditions necessary to co-operate with A in producing _p_; and that it is so cannot be ascertained without either general prior knowledge of the nature of the case or special experiments for the purpose. So that invariability will not really be inferred from a single experiment; besides that every prudent inquirer repeats his experiments, if only to guard against his own liability to error.

The supposed plurality of causes does not affect the method of Difference. In the above symbolic case, A is clearly _one_ cause (or condition) of _p_, whatever other causes may be possible; whereas with the Single Method of Agreement, it remained doubtful (admitting a plurality of causes) whether A, in spite of being always present with _p_, was ever a cause or condition of it.

This method of Difference without our being distinctly aware of it, is oftener than any other the basis of ordinary judgments. That the sun gives light and heat, that food nourishes and fire burns, that a stone breaks a window or kills a bird, that the turning of a tap permits or checks the flow of water or of gas, and thousands of other propositions are known to be true by rough but often emphatic applications of this method in common experience.

The method of Difference may be applied either (1) by observation, on finding two instances (distinct assemblages of conditions) differing only in one phenomenon together with its antecedent or consequent; or (2) by experiment, and then, either (a) by preparing two instances that may be compared side by side, or (b) by taking certain conditions, and then introducing (or subtracting) some agent, supposed to be the cause, to see what happens: in the latter case the "two instances" are the same assemblage of conditions considered before and, again, after, the introduction of the agent. As an example of (a) there is an experiment to show that radium gives off heat: take two glass tubes, in one put some chloride of radium, in both thermometers, and close them with cotton-wool. Soon the thermometer in the tube along with radium reads 54 deg. F. higher than the other one. The tube without the radium, whose temperature remains unaltered, is called the "control" experiment. Most experiments are of the type (b); and since the Canon, which describes two co-existing instances, does not readily apply to this type, an alternative version may be offered: _Any agent whose introduction into known circumstances (without further change) is immediately followed by a definite phenomenon is a condition of the occurrence of that phenomenon._

The words _into known circumstances_ are necessary to emphasise what is required by this Method, namely, that the two instances differ in only one thing; for this cannot be ascertained unless all the other conditions are known; and this further implies that they have been prepared. It is, therefore, not true (as Sigwart asserts) that this method determines only one condition of a

phenomenon, and that it is then necessary to inquire into the other conditions. If they were not known they must be investigated; but then the experiment would not have been made upon this method. Practically, experiments have to be made in all degrees of imperfection, and the less perfect they are, that is, the less the circumstances are known beforehand, the more remains to be done. A common imperfection is delay, or the occurrence of a latent period between the introduction of an agent and the manifestation of its effects; it cannot then be the unconditional cause; though it may be an indispensable remote condition of whatever change occurs. If, feeling out of sorts, you take a drug and some time afterwards feel better, it is not clear on this ground alone that the drug was the cause of recovery, for other curative processes may have been active meanwhile--food, or sleep, or exercise.

Any book of Physics or of Chemistry will furnish scores of examples of the method of Difference: such as Galileo's experiment to show that air has weight, by first weighing a vessel filled with ordinary air, and then filling it with condensed air and weighing it again; when the increased weight can only be due to the greater quantity of air contained. The melting-point of solids is determined by heating them until they do melt (as silver at 1000 deg. C., gold at 1250 deg., platinum at 2000 deg.); for the only difference between bodies at the time of melting and just before is the addition of so much heat. Similarly with the boiling point of liquids. That the transmission of sound depends upon the continuity of an elastic ponderable medium, is proved by letting a clock strike in a vacuum (under a glass from which the air has been withdrawn by an air pump), and standing upon a non-elastic pedestal: when the clock be seen to strike, but makes only such a faint sound as may be due to the imperfections of the vacuum and the pedestal.

The experiments by which the chemical analysis or synthesis of various forms of matter is demonstrated are simple or compound applications of this method of Difference, together with the quantitative mark of causation (that cause and effect are equal); since the bodies resulting from an analysis are equal in weight to the body analysed, and the body resulting from a synthesis is equal in weight to the bodies synthesised. That an electric current resolves water into oxygen and hydrogen may be proved by inserting the poles of a galvanic battery in a vessel of water; when this one change is followed by another, the rise of bubbles from each pole and the very gradual decrease of the water. If the bubbles are caught in receivers placed over them, it can be shown that the joint weight of the two bodies of gas thus formed is equal to the weight of the water that has disappeared; and that the gases are respectively oxygen and hydrogen may then be shown by proving that they have the properties of those gases according to further experiments by the method of Difference; as (e.g.) that one of them is oxygen because it supports combustion, etc.

When water was first decomposed by the electric current, there appeared not only oxygen and hydrogen, but also an acid and an alkali. These products were afterwards traced to impurities of the water and of the operator's hands. Mill observes that in any experiment the effect, or part of it, may be due, not to the supposed agent, but to the means employed in introducing it. We should know not only the other conditions of an experiment, but that the agent or change introduced is nothing else than what it is supposed to be.

In the more complex sciences the method of Difference is less easily applicable, because of the greater difficulty of being sure that only one circumstance at a time has altered; still, it is frequently used. Thus, if by dividing a certain nerve certain muscles are paralysed, it is shown that normally that nerve controls those muscles. That the sense of smell in flies and cockroaches is connected with the antennae has been shown by cutting them off: whereupon the insects can no longer find carrion. In his work on _Earthworms_, Darwin shows that, though sensitive to mechanical tremors, they are deaf (or, at least, not sensitive to sonorous vibrations transmitted through the air), by the following experiment. He placed a pot containing a worm that had come to the surface, as usual at night, upon a table, whilst close by a piano was violently played; but the worm took no notice of the noise. He then placed the pot upon the piano, whilst it was being played, when the worm, probably feeling mechanical vibrations, hastily slid back into its burrow.

When, instead of altering one circumstance in an instance (which we have done our best not otherwise to disturb) and then watching what follows, we try to find two ready-made instances of a phenomenon, which only differ in one other circumstance, it is, of course, still more difficult to be sure that there is only one other circumstance in which they differ. It may be worth while, however, to look for such instances. Thus, that the temperature of ocean currents influences the climate of the shores they wash, seems to be shown by the fact that the average temperature of Newfoundland is lower than that of the Norwegian coast some 15 deg. farther north. Both regions have great continents at their back; and as the mountains of Norway are higher and capped with perennial snow, we might expect a colder climate there: but the shore of Norway is visited by the Gulf Stream, whilst the shore of Newfoundland is traversed by a cold current from Greenland. Again, when in 1841 the railway from Rouen to Paris was being built, gangs of English and gangs of French workmen were employed upon it, and the English got through about one-third more work per man than the French. It was suspected that this difference was due to one other difference, namely, that the English fed better, preferring beef to thin soup. Now, logically, it might have been objected that the evidence was unsatisfactory, seeing that the men

differed in other things besides diet--in 'race' (say), which explains so much and so easily. But the Frenchmen, having been induced to try the same diet as the English, were, in a few days, able to do as much work: so that the "two instances" were better than they looked. It often happens that evidence, though logically questionable, is good when used by experts, whose familiarity with the subject makes it good.

Sec. 4. THE CANON OF CONCOMITANT VARIATIONS.

Whatever phenomenon varies in any manner whenever another phenomenon (consequent or antecedent) varies in some particular manner [no other change having concurred] is either the cause or effect of that phenomenon [or is connected with it through some fact of causation].

This is not an entirely fresh method, but may be regarded as a special case either of Agreement or of Difference, to prove the cause or effect, not of a phenomenon as a whole, but of some increment of it (positive or negative). There are certain forces, such as gravitation, heat, friction, that can never be eliminated altogether, and therefore can only be studied in their degrees. To such phenomena the method of Difference cannot be applied, because there are no negative instances. But we may obtain negative instances of a given quantity of such a phenomenon (say, heat), and may apply the method of Difference to that quantity. Thus, if the heat of a body increases 10 degrees, from 60 to 70, the former temperature of 60 was a negative instance in respect of those 10 degrees; and if only one other circumstance (say, friction) has altered at the same time, that circumstance (if an antecedent) is the cause. Accordingly, if in the above Canon we insert, after 'particular manner,' "[no other change having concurred,]" it is a statement of the method of Difference as applicable to the increment of a phenomenon, instead of to the phenomenon as a whole; and we may then omit the last clause--"[or is connected, etc.]." For these words are inserted to provide for the case of co-effects of a common cause (such as the flash and report of a gun); but if no other change (such as the discharge of a gun) has concurred with the variations of two phenomena, there cannot have been a common cause, and they are therefore cause and effect.

If, on the other hand, we omit the clause "[no other change having concurred,]" the Canon is a statement of the method of Agreement as applicable to the increment of a phenomenon instead of to the phenomenon as a whole; and it is then subject to the imperfections of that method: that is to say, it leaves open the possibilities, that an inquirer may overlook a plurality of causes; or may mistake a connection of two phenomena, which (like the flash and report of a gun) are co-effects of a common cause, for a direct relation of cause and effect.

It may occur to the reader that we ought also to distinguish Qualitative and Quantitative Variations as two orders of phenomena to which the present method is applicable. But, in fact, Qualitative Variations may be adequately dealt with by the foregoing methods of Agreement, Double Agreement, and Difference; because a change of quality or property entirely gets rid of the former phase of that quality, or substitutes one for another; as when the ptarmigan changes from brown to white in winter, or as when a stag grows and sheds its antlers with the course of the seasons. The peculiar use of the method of Variations, however, is to formulate the conditions of proof in respect of those causes or effects which cannot be entirely got rid of, but can be obtained only in greater or less amount; and such phenomena are or course, quantitative.

Even when there are two parallel series of phenomena the one quantitative and the other qualitative--like the rate of air-vibration and the pitch of sound, or the rate of ether-vibration and the colour-series of the spectrum--the method of Variations is not applicable. For (1) two such series cannot be said to vary together, since the qualitative variations are heterogeneous: 512: 576 is a definite ratio; but the corresponding notes, C, D, in the treble clef, present only a difference. Hence (2) the correspondence of each note with each number is a distinct fact. Each octave even is a distinct fact; there is a difference between C 64 and C 128 that could never have been anticipated without the appropriate experience. There is, therefore, no such law of these parallel series as there is for temperature and change of volume (say) in mercury. Similar remarks apply to the physical and sensitive light-series.

We may illustrate the two cases of the method thus (putting a dash against any letter, A' or _p_', to signify an increase or decrease of the phenomenon the letter stands for): Agreement in Variations (other changes being admissible)--

A B C A' D E A'' F G _p q r_ _p' s t_ _p'' u v_

Here the accompanying phenomena (_B C q r, D E s t, F G u v_) change from time to time, and the one thing in which the instances agree throughout is that any increase of A (A' or A'') is followed or accompanied by an increase of _p (p' or p'')_: whence it is argued that A is the cause of _p_, according to Prop. III. (a) (ch. xv. Sec. 7). Still, it is supposable that, in the second instance, D or E may be the cause of the increment of _p_; and that, in the third instance, F or G may be its cause: though the probability of

such vicarious causation decreases rapidly with the increase of instances in which A and _p_ vary together. And, since an actual investigation of this type must rely on observation, it is further possible that some undiscovered cause, X, is the real determinant of both A and _p_ and of their concomitant variations.

Professor Ferri, in his _Criminal Sociology_, observes: "I have shown that in France there is a manifest correspondence of increase and decrease between the number of homicides, assaults and malicious wounding, and the more or less abundant vintage, especially in the years of extraordinary variations, whether of failure of the vintage (1853-5, 1859, 1867, 1873, 1878-80), attended by a remarkable diminution of crime (assaults and wounding), or of abundant vintages (1850, 1856-8, 1862-3, 1865, 1868, 1874-5), attended by an increase of crime" (p. 117, Eng. trans.). And earlier he had remarked that such crimes also "in their oscillations from month to month display a characteristic increase during the vintage periods, from June to December, notwithstanding the constant diminution of other offences" (p. 77). This is necessarily an appeal to the canon of Concomitant Variations, because France is never without her annual vintage, nor yet without her annual statistics of crime. Still, it is an argument whose cogency is only that of Agreement, showing that probably the abuse of the vintage is a cause of crimes of violence, but leaving open the supposition, that some other circumstance or circumstances, arising or varying from year to year, may determine the increase or decrease of crime; or that there is some unconsidered agent which affects both the vintage and crimes of violence. French sunshine, it might be urged, whilst it matures the generous grape, also excites a morbid fermentation in the human mind.

Difference in Variations may be symbolically represented thus (no other change having concurred):

A B A' B A'' B _p q_, _p' q_, _p'' q_.

Here the accompanying phenomena are always the same B/q; and the only point in which the successive instances differ is in the increments of A (A', A'') followed by corresponding increments of _p_ (_p', p''_): hence the increment of A is the cause of the increment of _p_.

For examples of the application of this method, the reader should refer to some work of exact science. He will find in Deschanel's _Natural Philosophy_, c. 32, an account of some experiments by which the connection between heat and mechanical work has been established. It is there shown that "whenever work is performed by the agency of heat" [as in driving an engine], "an amount of heat disappears equivalent to the work performed; and whenever mechanical work is spent in generating heat" [as in rubbing two sticks together], "the heat generated is equivalent to the work thus spent." And an experiment of Joule's is described, which consisted in fixing a rod with paddles in a vessel of water, and making it revolve and agitate the water by means of a string wound round the rod, passed over a pulley and attached to a weight that was allowed to fall. The descent of the weight was measured by a graduated rule, and the rise of the water's temperature by a thermometer. "It was found that the heat communicated to the water by the agitation amounted to one pound-degree Fahrenheit for every 772 foot-pounds of work" expended by the falling weight. As no other material change seems to take place during such an experiment, it shows that the progressive expenditure of mechanical energy is the cause of the progressive heating of the water.

The thermometer itself illustrates this method. It has been found that the application of heat to mercury expands it according to a law; and hence the volume of the mercury, measured by a graduated index, is used to indicate the temperature of the air, water, animal body, etc., in which the thermometer is immersed, or with which it is brought into contact. In such cases, if no other change has taken place, the heat of the air, water, or body is the cause of the rise of the mercury in its tube. If some other substance (say spirit) be substituted for mercury in constructing a thermometer, it serves the same purpose, provided the index be graduated according to the law of the expansion of that substance by heat, as experimentally determined.

Instances of phenomena that do not vary together indicate the exclusion of a supposed cause (by Prop. III (c)). The stature of the human race has been supposed to depend on temperature; but there is no correspondence. The "not varying together," however, must not be confused with "varying inversely," which when regular indicates a true concomitance. It is often a matter of convenience whether we regard concomitant phenomena as varying directly or inversely. It is usual to say--'the greater the friction the less the speed'; but it is really more intelligible to say--'the greater the friction the more rapidly molar is converted into molecular motion.'

The Graphic Method exhibits Concomitant Variations to the eye, and is extensively used in physical and statistical inquiries. Along a horizontal line (the abscissa) is measured one of the conditions (or agents) with which the inquiry is concerned, called the Variable; and along perpendiculars (ordinates) is measured some phenomenon to be compared with it, called the Variant.

Thus, the expansion of a liquid by heat may be represented by measuring degrees of temperature along the horizontal, and the expansion of a column of the liquids in units of length along the perpendicular.

[Illustration: FIG. 9.]

In the next diagram (Fig. 10), reduced from one given by Mr. C.H. Denyer in an article on the Price of Tea (_Economic Journal_, No. 9), the condition measured horizontally is Time; and, vertically, three variants are measured simultaneously, so that their relations to one another from time to time may be seen at a glance. From this it is evident that, as the duty on tea falls, the price of tea falls, whilst the consumption of tea rises; and, in spite of some irregularity of correspondence in the courses of the three phenomena, their general causal connection can hardly be mistaken. However, the causal connection may also be inferred by general reasoning; the statistical Induction can be confirmed by a Deduction; thus illustrating the combined method of proof to be discussed in the next chapter. Without such confirmation the proof by Concomitant Variations would not be complete; because, from the complexity of the circumstances, social statistics can only yield evidence according to the method of Agreement in Variations. For, besides the agents that are measured, there may always be some other important influence at work. During the last fifty years, for example, crime has decreased whilst education has increased: true, but at the same time wages have risen and many other things have happened.

[Illustration: FIG. 10.]

It will be noticed that in the diagram the three lines, especially those of Price and Consumption (which may be considered _natural_ resultants, in contrast with the arbitrary fixation of a Tax), do not depart widely from regular curves; and accordingly, assuming the causes at work to vary continuously during the intervals between points of measurement, curves may be substituted. In fact, a curve often represents the course of a phenomenon more truthfully than can be done by a line that zigzags along the exact measurements; because it is less influenced by temporary and extraordinary causes that may obscure the operation of those that are being investigated. On the other hand, the abrupt deviations of a punctilious zigzag may have their own logical value, as will appear in the next section.

In working with the Method of Variations one must allow for the occurrence in a series of 'critical points,' at which sudden and sometimes heterogeneous changes may take place. Every substance exists at different temperatures in three states, gaseous, liquid, solid; and when the change takes place, from one state to another, the series of variations is broken. Water, e.g., follows the general law that cooling is accompanied by decrease of volume between 212 deg. and 39 deg. F.: but above 212 deg., undergoes a sudden expansion in becoming a gas; and below 39 deg. begins to expand, until at 32 deg. the expansion is considerable on its becoming solid. This illustrates a common experience that concomitant variations are most regular in the 'median range,' and are apt to become irregular at the extremities of the series, where new conditions begin to operate.

The Canon of Variations, again, deals not with sudden irruptions of a cause, force or agent, but with some increase or decrease of an agent already present, and a corresponding increase or decrease of some other phenomenon--say an increase of tax and a rise of price. But there are cases in which the energy of a cause is not immediately discharged and dissipated. Whilst a tax of 6_d._ per lb. on tea raises the price per lb. by about 6_d._, however long it lasts, the continuous application of friction to a body may gradually raise its temperature to the point of combustion; because heat is received faster than it is radiated, and therefore accumulates. Such cases are treated by Mill under the title of 'progressive effects' (_Logic_: B. III., c. 15): he gives as an example of it the acceleration of falling bodies. The storage of effects is a fact of the utmost importance in all departments of nature, and is especially interesting in Biology and Sociology, where it is met with as heredity, experience, tradition. Evolution of species of plants and animals would (so far as we know) be impossible, if the changes (however caused) that adapt some individuals better than others to the conditions of life were not inherited by, and accumulated in, their posterity. The eyes in the peacock's tail are supposed to have reached their present perfection gradually, through various stages that may be illustrated by the ocelli in the wings of the Argus pheasant and other genera of _Phasianidae_. Similarly the progress of societies would be impossible without tradition, whereby the improvements made in any generation may be passed on to the next, and the experience of mankind may be gradually accumulated in various forms of culture. The earliest remains of culture are flint implements and weapons; in which we can trace the effect of tradition in the lives of our remote forefathers, as they slowly through thousands of years learnt to improve the chipping of flints, until the first rudely shaped lumps gave place to works of unmistakable design, and these to the beautiful weapons contemporary with the Bronze Age.

The Method of Gradations, the arranging of any phenomena to be studied in series, according to the degree in which some character is exhibited, is, perhaps, the most definite device in the Art of Discovery. (Bain: _Induction_, c. 6, and App. II.) If the causes are unknown it is likely to suggest hypotheses: and if the causes are partly known, variation in the character of the series is likely to indicate a corresponding variation of the conditions.

Sec. 5. THE CANON OF RESIDUES.

Subduct from any phenomenon such part as previous inductions have shown to be the effect of certain antecedents, and the residue of the phenomenon is the effect of the remaining antecedents.

The phenomenon is here assumed to be an effect: a similar Canon may be framed for residuary causes.

This also is not a fresh method, but a special case of the method of Difference. For if we suppose the phenomenon to be _p q r_, and the antecedent to be A B C, and that we already know B and C to have (either severally or together) the consequents _q r_, in which their efficacy is exhausted; we may regard

B C _q r_

as an instance of the absence of _p_ obtained deductively from the whole phenomenon

A B C _p q r_

by our knowledge of the laws of B and C; so that

A B C _p q r_

is an instance of the presence of _p_, differing otherwise from

B C _q r_

in nothing except that A is also present. By the Canon of Difference, therefore A is the cause of _p_. Or, again, when phenomena thus treated are strictly quantitative, the method may be based on Prop. III. (b), ch. xv. Sec. 7.

Of course, if A can be obtained apart from B C and directly experimented with so as to produce _p_, so much the better; and this may often be done; but the special value of the method of Residues appears, when some complex phenomenon has been for the most part accounted for by known causes, whilst there remains some excess, or shortcoming, or deviation from the result which those causes alone would lead us to expect, and this residuary fact has to be explained in relation to the whole. Here the negative instance is constituted by deduction, showing what would happen but for the interference of some unknown cause which is to be investigated; and this prominence of the deductive process has led some writers to class the method as deductive. But we have seen that all the Canons involve deduction; and, considering how much in every experiment is assumed as already known (what circumstances are 'material,' and when conditions may be called 'the same'), the wonder is that no one has insisted upon regarding every method as concerned with residues. In fact, as scientific explanation progresses, the phenomena that may be considered as residuary become more numerous and the importance of this method increases.

Examples: The recorded dates of ancient eclipses having been found to differ from those assigned by calculation, it appears that the average length of a day has in the meanwhile increased. This is a residuary phenomenon not accounted for by the causes formerly recognised as determining the rotation of the earth on its axis; and it may be explained by the consideration that the friction of the tides reduces the rate of the earth's rotation, and thereby lengthens the day. Astronomy abounds in examples of the method of Residues, of which the discovery of Neptune is the most famous.

Capillarity seems to be a striking exception to the principle that water (or any liquid) 'finds its level,' that being the condition of equilibrium; yet capillarity proves to be only a refined case of equilibrium when account is taken of the forces of adhesion exerted by different kinds of bodies in contact.

"Many of the new elements of Chemistry," says Herschel, "have been detected in the investigation of residual phenomena." Thus, Lord Rayleigh and Sir W. Ramsay found that nitrogen from the atmosphere was slightly heavier than nitrogen got from chemical sources; and, seeking the cause of this difference, discovered argon.

The Economist shows that when a country imports goods the chief means of paying for them is to export other goods. If this were all, imports and exports would be of equal value: yet the United Kingdom imports about L400,000,000 annually, and exports about L300,000,000. Here, then, is a residuary phenomenon of L100,000,000 to be accounted for. But foreign countries owe us about L50,000,000 for the use of shipping, and L70,000,000 as interest on the capital we have lent them, and L15,000,000 in commissions upon business transacted for them. These sums added together amount to L135,000,000; and that is L35,000,000 too much. Thus another residuary phenomenon emerges; for whilst foreigners seem to owe us L435,000,000 they only send us L400,000,000 of imports. These L35,000,000 are accounted for by the annual investment of our capital abroad, in return for which no immediate payment is due; and, these being omitted, exports and imports balance. Since this was written the figures of our foreign trade have greatly risen; but the character of the explanation remains the same.

When, in pursuing the method of Variations, the phenomena compared do not always correspond in their fluctuations, the irregular movements of that phenomenon which we regard as the effect may often be explained by treating them as residuary phenomena, and then seeking for exceptional causes, whose temporary interference has obscured the influence of the general cause. Thus, returning to the diagram of the Price of Tea in Sec. 4, it is clear that generally the price falls as the duty falls; but in Mr. Denyer's more minutely wrought diagram, from which this is reduced, it may be seen that in 1840 the price of tea rose from 3_s._ 9_d._ to 4_s._ 9_d._ without any increase of duty. This, however, is readily explained by the Chinese War of that year, which checked the supply. Again, from 1869 to 1889 the duty was constant, whilst the price of tea fell as much as 8_d._ per lb.; but this residuary phenomenon is explained by the prodigiously increased production of tea during that period in India and Ceylon.

The above examples of the method of Residues are all quantitative; but the method is often employed where exact estimates are unobtainable. Thus Darwin, having found certain modifications of animals in form, coloration and habits, that were not clearly derivable from their struggle for existence in relation to other species or to external conditions, suggested that they were due to Sexual Selection.

The 'vestiges' and 'survivals' so common in Biology and Sociology are residuary phenomena. It is a general inference from the doctrine of Natural Selection that every organ of a plant, animal, or society is in some way useful to it. There occur, however, organs that have at present no assignable utility, are at least wasteful, and sometimes even injurious. And the explanation is that formerly they were useful; but that, their uses having lapsed, they are now retained by the force of heredity or tradition. Either they are not injurious enough to be eliminated by natural selection; or they are correlated with other organs, whose utility outweighs their disutility.

CHAPTER XVII

COMBINATION OF INDUCTION WITH DEDUCTION

Sec. 1. We have now reviewed Mill's five Canons of Inductive Proof. At bottom, as he observes, there are only two, namely, Agreement and Difference: since the Double Method, Variations and Residues are only special forms of the other two. Indeed, in their function of _proof_, they are all reducible to one, namely, Difference; for the cogency of the method of Agreement (as distinguished from a simple enumeration of instances agreeing in the coincidence of a supposed cause and its effect), depends upon the omission, in one instance after another, of all other circumstances; which omission is a point of difference.

The Canons are an analysis of the conditions of proving directly (where possible), by means of observation or experiment, any proposition that predicates causation. But if we say 'by means of observation or experiment,' it is not to be understood that these are the only means and that nothing else is involved; for it has been shown that the Law of Causation is itself an indispensable foundation of the evidence. In fact Inductive Logic may be considered as having a purely formal character. It consists (1) in a statement of the Law of Cause and Effect; (2) in certain immediate inferences from this Law, expanded into the Canons; (3) in the syllogistic application of the Canons to special predications of causation by means of minor premises, showing that certain instances satisfy the Canons.

At the risk of some pedantry, we may exhibit the process as follows (_cf._ Prof. Ray's _Logic_: Appendix D):

Whatever relation of events has certain marks is a case of causation;

The relation A: _p_ has some or all of these marks (as shown by observation and by the conformity of instances to such or such a Canon):

Therefore, the relation A: _p_ is a case of causation. Now, the parenthesis, "as shown by the conformity, etc.," is an adscititious member of an Epicheirema, which may be stated, as a Prosyllogism, thus:

If an instance, etc. (Canon of Difference);

The instances A B C B C are of the kind required: _p q r' q r_

Therefore, A, present where _p_ occurs and absent where it does not occur, is an indispensable antecedent of _p_.

Such is the bare Logic of Induction: so that, strictly speaking, observation or experiment is no part of the logic, but a means of applying the logic to actual, that is, not merely symbolical, propositions. The Formal Logic of Induction is essentially deductive; and it has been much questioned whether any transition from the formal to the material conditions of proof is possible. As long as we are content to illustrate the Canons with symbols, such as A and _p_, all goes well; but can we in any actual investigation show that the relevant facts or 'instances' correspond with those symbols?

In the first place, as Dr. Venn shows, natural phenomena want the distinctness and capability of isolation that belong to symbols. Secondly, the observing whether instances conform to a Canon, must always be subject at last to the limits of our faculties. How can we ascertain exact equality, immediate sequence? The Canon of Difference, in its experimental application, is usually considered the most cogent sort of proof: yet when can the two sequent instances, before and after the introduction of a certain agent, be said to differ in nothing else? Are not earth and stars always changing position; is not every molecule in the room and apparatus always oscillating? It is true that our senses are now aided by elaborate instruments; but the construction of these depends on scientific theories, which again depend on experiments.

It is right to touch upon this well-known sceptical topic; but to insist much upon it is not a sign of good sense. The works of Herschel, Whewell, and Jevons should be consulted for the various methods of correcting observations, by repeating them, averaging them, verifying one experimental process by another, always refining the methods of exact measurement, multiplying the opportunities of error (that if any exist it may at last show itself), and by other devices of what may be called Material Logic or Methodology. But only direct experience and personal manipulation of scientific processes, can give a just sense of their effectiveness; and to stand by, suggesting academic doubts, is easier and more amusing.

Sec. 2. Still, it is not so much in laws based upon direct observation or experiment, that the material validity of scientific reasoning appears, as in the cumulative evidence that arises from the co-ordination of laws within each science, and the growing harmony and coherence of all sciences. This requires a more elaborate combination of deduction with observation and experiment. During the last three hundred years many departments of science have been reduced under principles of the greatest generality, such as the Conservation of Energy, the Law of Gravitation, the Undulatory theory of Light, the Law of combining Equivalents, and the Theory of Natural Selection; connecting and explaining the less general laws, which, again, are said to connect and explain the facts. Meanwhile, those sciences that were the first to make progress have helped to develop others which, like Biology and Sociology, present greater difficulties; and it becomes more and more apparent that the distinctions drawn among sciences are entirely for the convenience of study, and that all sciences tend to merge in one universal Science of Nature. Now, this process of the 'unification of knowledge' is almost another name for deduction; but at the same time it depends for its reality and solidity upon a constant reference to observation and experiment. Only a very inadequate notion of it can be given in the ensuing chapters.

We saw in chap. xiv. Sec. 6, that when two or more agents or forces combine to produce a phenomenon, their effects are intermixed in it, and this in one of two ways according to their nature. In chemical action and in vegetable and animal life, the causal agents concerned are blended in their results in such a way that most of the qualities which they exhibited severally are lost, whilst new qualities appear instead. Thus chlorine (a greenish-yellow gas) and sodium (a metal) unite to form common salt NaCl; which is quite unlike either of them: a man eats bread, and it becomes muscle, nerve and bone. In such cases we cannot trace the qualities of the causal agents in the qualities of the effects; given such causes, we can prove experimentally, according to the canons of induction, that they have such effects; but we may not be able in any new case to calculate what the effects will be.

On the other hand, in Astronomy and Physics, the causes treated of are mechanical; at least, it is the aim of Physics to attain to a mechanical conception of phenomena; so that, in every new combination of forces, the intermixed effect, or resultant, may be calculated beforehand; provided that the forces concerned admit of being quantitatively estimated, and that the conditions of their combination are not so complex as to baffle the powers of mathematicians. In such cases, when direct observation or experiment is insufficient to resolve an effect into the laws of its conditions, the general method is to calculate what may be expected from a

combination of its conditions, as either known or hypothetically assumed, and to compare this anticipation with the actual phenomenon.

Sec. 3. This is what Mill calls the Direct Deductive Method; or, the Physical Method, because it is so much relied on in treating of Light, Heat, Sound, etc.; it is also the method of Astronomy and much used in Economics: Deduction leads the way, and its results are tested inductively by experiments or observations. Given any complex mechanical phenomenon, the inquirer considers--(1) what laws already ascertained seem likely to apply to it (in default of known laws, hypotheses are substituted: _cf._ chap. xviii.); he then--(2) computes the effect that will follow from these laws in circumstances similar to the case before him; and (3) he verifies his conclusion by comparing it with the actual phenomenon.

A simple example of this method is the explanation of the rise of water in the 'common pump.' We know three laws applicable to this case: (a) that the atmosphere weighs upon the water outside the pump with a pressure of 15 lb. to the square inch; (b) that a liquid (and therefore the water) transmits pressure equally in all directions (upwards as well as downwards and sideways); and (c) that pressure upon a body in any direction, if not counteracted by an opposite pressure, produces motion. Hence, when the rise of the piston of the pump removes the pressure upon the water within the cylinder, tending to produce a vacuum there, this water is pushed up by the pressure of the air upon the water outside the cylinder, and follows the rising piston, until the column of water inside the cylinder exerts a pressure equal to that of the atmosphere upon an equal area. So much for the computation; does it correspond with the fact? It is found that at the sea level water can be pumped to the height of 33 ft; and that such a column of water has a pressure of 15 lb. to the square inch. We may show further that, at the sea level, spirits of wine may be pumped higher according to its less specific gravity; and that if we attempt to pump water at successive altitudes above the sea level, we can only raise it to less and less heights, corresponding with the lessened atmospheric pressure at those altitudes, where the column of air producing the pressure is shorter. Finally, if we try to work a pump, having first produced a vacuum over the water outside the cylinder, we shall find that the water inside will not rise at all; the piston can be raised, but the water does not follow it. The verification thus shows that the computed effect corresponds with the phenomenon to be explained; that the result does not depend upon the nature of water only, but is true (allowing for differences of specific gravity) of other liquids; that if the pressure of the outside air is diminished, the height of pumping is so too (canon of Variations); and that if that pressure is entirely removed, pumping becomes impossible (canon of Difference).

Any text-book of Astronomy or Physics furnishes numerous illustrations of the deductive method. Take, for example, the first chapter of Deschanel's _Optics_, where are given three methods of determining the velocity of Light. This was first deduced from observation of Jupiter's satellites. The one nearest the planet passes behind it, or into its shadow, and is eclipsed, at intervals of about 42-1/2 hours. But it can be shown that, when Jupiter and the Earth are nearest together on the same side of the Sun, an eclipse of this satellite is visible from the earth 16 min. 26.6 sec. earlier than when Jupiter and the earth are furthest apart on opposite sides of the Sun: 16 min. 26.6 sec, then, is the time in which light traverses the diameter of the Earth's orbit. Therefore, supposing the Earth's distance from the Sun to be 92 millions of miles, light travels about 186,000 miles a second. Another deduction, agreeing with this, starts from the fact of aberration, or the displacement of the apparent from the actual position of the stars in the direction of the earth's motion. Aberration depends partly on the velocity of light, partly on the velocity of the Earth; and the latter being known, the former can be computed. Now, these two deductive arguments, verifying each other, have also been verified experimentally. Foucault's experiment to measure the velocity of light is too elaborate to be described here: a full account of it will be found in the treatise above cited, Sec. 687.

When the phenomena to be explained are of such a character, so vast in extent, power or duration, that it is impossible, in the actual circumstances of the case, to frame experiments in order to verify a deductive explanation, it may still be possible to reproduce a similar phenomenon upon a smaller scale. Thus Monge's explanation of mirage by the great heat of the desert sand, which makes the lowest stratum of air less dense than those above it, so that rays of light from distant objects are refracted in descending, until they are actually turned upwards again to the eye of the beholders, giving him inverted images of the objects as if they were reflected in water, is manifestly incapable of being verified by experiment in the natural conditions of the phenomenon. But by heating the bottom of "a sheet-iron box, with its ends cut away," the rarefied air at the bottom of the box may sometimes be made to yield reflections; and this shows at least that the supposed cause is a possible one (Deschanel, _Optics,_ Sec. 726). Similarly as to the vastest of all phenomena, the evolution of the stellar system, and of the solar system as part of it, from an immense cloudlike volume of matter: H. Spencer, in his Essay on _The Nebular Hypothesis_, says, amidst a great array of deductive arguments from mechanical principles, that "this _a priori_ reasoning harmonises with the results of experiment. Dr. Plateau has shown that when a mass of fluid is, as far as may be, protected from the action of external forces, it will, if made to

rotate with adequate velocity, form detached rings; and that these rings will break up into spheroids, which turn on their axes in the same direction with the central mass." The theory of the evolution of species of plants and animals by Natural Selection, again, though, of course, it cannot be verified by direct experiment (since experiment implies artificial arrangement), and the process is too slow for observation, is, nevertheless, to some extent confirmed by the practice of gardeners and breeders of animals: since, by taking advantage of accidental variations of form and colour in the plants or animals under their care, and relying on the inheritability of these variations they obtain extensive modifications of the original stocks, and adapt them to the various purposes for which flowers and cereals, poultry, dogs and cattle are domesticated. This shows, at least, that living forms are plastic, and extensively modifiable in a comparatively short time.

Sec. 4. Suppose, however, that, in verifying a deductive argument, the effect as computed from the laws of the causes assigned, does not correspond with the facts observed: there must then be an error somewhere. If the fact has been accurately observed, the error must lie either in the process of deduction and computation, or else in the premises. As to the process of deduction, it may be very simple and easily revised, as in the above explanation of the common pump; or it may be very involved and comprise long trains of mathematical calculation. If, however, on re-examining the computations, we find them correct, it remains to look for some mistake in the premises.

(1) We may not have accurately ascertained the laws, or the modes of operation, or the amounts of the forces present. Thus, the rate at which bodies fall was formerly believed to vary in proportion to their relative weights; and any estimate based upon this belief cannot agree with the facts. Again, the corpuscular theory of light, namely, that the physical cause of light is a stream of fine particles projected in straight lines from the luminous object, though it seemed adequate to the explanation of many optical phenomena, could not be made to agree with the facts of interference and double refraction.

(2) The circumstances in which the agents are combined may not have been correctly conceived. When Newton began to inquire whether the attraction of the earth determined the orbit of the moon, he was at first disappointed. "According to Newton's calculations, made at this time," says Whewell, "the moon, by her motion in her orbit, was deflected from the tangent every minute through a space of thirteen feet. But by noticing the space which bodies would fall in one minute at the earth's surface, and supposing this to be diminished in the ratio of the inverse square, it appeared that gravity would, at the moon's orbit, draw a body through more than fifteen feet." In view of this discrepancy he gave up the inquiry for sixteen years, until in 1682, having obtained better data, he successfully renewed it. "He had been mistaken in the magnitude of the earth, and consequently in the distance of the moon, which is determined by measurements of which the earth's radius is the base." It was not, therefore, a mistake as to the law or as to the nature of the forces concerned (namely, the law of the inverse square and the identity of celestial with terrestrial gravity), but as to the circumstances in which the agents (earth and moon) were combined, that prevented his calculations being verified. (_Hist. Ind. Sc._: VII. ii. 3.)

(3) One or more of the agents affecting the result may have been overlooked and omitted from the estimate. Thus, an attempt to explain the tides by taking account only of the earth and the moon, will not entirely agree with the facts, since the sun also influences the tides. This illustration, however, shows that when the conclusion of a deductive explanation does not entirely agree with the facts, it is not always to be inferred that the reasoning is, properly speaking, wrong; it may be right as far as it goes, and merely inadequate. Hence (a) in such cases an opportunity occurs of applying the Method of Residues, by discovering the agent that must be allowed for in order to complete the explanation. And (b) the investigation of a phenomenon is often designedly begun upon an imperfect basis for the sake of simplicity; the result being regarded as a first approximation, to be afterwards corrected by including, one by one, the remaining agents or circumstances affecting the phenomenon, until the theory is complete; that is, until its agreement with the facts is satisfactory.

(4) We may have included among the data of our reasonings agents or circumstances that do not exist or do not affect the phenomenon in question. In the early days of science purely fanciful powers were much relied upon: such as the solid spheres that carried the planets and stars; the influence of the planets upon human destiny; the tendency of everything to seek "its own place," so that fire rises to heaven, and solids fall to the earth; the "plastic virtue" of the soil, which was once thought to have produced fossils. When, however, such conceptions hindered the progress of explanation, it was not so much by vitiating the deductive method as by putting men off from exact inquiries. More to our present purpose were the supposed cataclysms, or extraordinary convulsions of the earth, a belief in which long hindered the progress of Geology. Again, in Biology, Psychology, and Sociology many explanations have depended upon the doctrine that any improvement of structure or faculty acquired by an individual may be inherited by his descendants: as that, if an animal learns to climb trees, his offspring have a greater aptitude for that mode of life; that if a man tries to be good, his children find it easier to be virtuous; that if the inhabitants of a district carry on cloth-work, it

becomes easier for each successive generation to acquire dexterity in that art. But now the inheritability of powers acquired by the individual through his own efforts, is disputed; and, if the denial be made good, all such explanations as the above must be revised.

If, then, the premises of a deductive argument be vitiated in any of these four ways, its conclusion will fail to agree with the results of observation and experiment, unless, of course, one kind of error happen to be cancelled by another that is 'equal and opposite.' We now come to a variation of the method of combining Induction with Deduction, so important as to require separate treatment.

Sec. 5. The Inverse or Historical Method has of late years become remarkably fruitful. When the forces determining a phenomenon are too numerous, or too indefinite, to be combined in a direct deduction, we may begin by collecting an empirical law of the phenomenon (as that 'the democracies of City-States are arbitrary and fickle'), and then endeavour to show by deductions from "the nature of the case," that is, from a consideration of the circumstances and forces known to be operative (of which, in the above instance, the most important is sympathetic contagion), that such a law was to be expected. Deduction is thus called in to verify a previous induction; whereas in the 'Physical Method' a deduction was verified by comparing it with an induction or an experiment; hence the method now to be discussed has been named the Inverse Deductive Method.

But although it is true that, in such inquiries as we are now dealing with, induction generally takes the lead; yet I cannot think that the mere order in which the two logical processes occur is the essential distinction between the two ways of combining them. For, in the first place, in investigations of any complexity both induction and deduction recur again and again in whatever order may be most convenient; and, in the second place, the so-called 'inverse order' is sometimes resorted to in Astronomy and Physics. For example, Kepler's Laws were first collected empirically from observations of the planetary motions, and afterwards deduced by Newton from the Law of Gravitation; this, then, was the Inverse Method; but the result is something very different from any that can be obtained by the Historical Method. The essential difference between the Physical and Historical Methods is that, in the former, whether Direct or Inverse, the deductive process, when complete, amounts to exact demonstration; whereas, in the latter, the deductions may consist of qualitative reasonings, and the results are indefinite. They establish--(1) a merely probable connection between the phenomena according to an empirical law (say, between City-democracy and fickle politics); (2) connect this with other historical or social generalisations, by showing that they all alike flow from the same causes, namely, from the nature of races of men under certain social and geographical conditions; and (3) explain why such empirical laws may fail, according to the differences that prevail among races of men and among the conditions under which they live. Thus, seeing how rapidly excitement is propagated by the chatter, grimacing, and gesticulation of townsmen, it is probable enough that the democracy of a City-state should be fickle (and arbitrary, because irresponsible). A similar phenomenon of panic, sympathetic hope and despair, is exhibited by every stock-exchange, and is not peculiar to political life. And when political opinion is not manufactured solely in the reverberating furnace of a city, fickleness ceases to characterise democracy; and, in fact, is not found in Switzerland, or the United States, nor in France so far as politics, depend upon the peasantry.

This is called the Historical Method, then, because it is especially useful in explaining the movements of history, and in verifying the generalisations of political and social science. We must not, however, suppose that its use is confined to such studies. Only a ridiculous pedantry would allot to each subject its own method and forbid the use of any other; as if it were not our capital object to establish truth by any means. Wherever the forces determining a phenomenon are too numerous or too indefinite to be combined in a deductive demonstration, there the Historical Method is likely to be useful; and this seems often to be the case in Geology and Biology, as well as in the Science of History, or Sociology, and its various subsidiary studies.

Consider upon what causes historical events depend: the customs, character, and opinions of all the people concerned; the organisation of their government, and the character of their religious institutions; the development of industry among them, of the military art, of fine art, literature and science; their relations, commercial, political and social, with other nations; the physical conditions of climate and geographical position amidst which they live. Hardly an event of importance occurs in any nation that is not, directly or indirectly, influenced by every one of these circumstances, and that does not react upon them. Now, from the nature of the Canons of direct Induction, a satisfactory employment of them in such a complex and tangled situation as history presents, is rarely possible; for they all require the actual or virtual isolation of the phenomenon under investigation. They also require the greatest attainable immediacy of connection between cause and effect; whereas the causes of social events may accumulate during hundreds of years. In collecting empirical laws from history, therefore, only very rough inductions can be hoped for, and we may have to be content with simple enumeration. Hence the importance of supporting such laws by deduction from the nature of the case, however faint a probability of the asserted connection is thereby raised; and this even if each law is valued merely for its own sake. Still more, if anything worth the name of Historical Science is to be constructed, must a mere collection of such empiricisms fail to content us; and the only way to give them a scientific character is to show deductively their common dependence

upon various combinations of the same causes. Yet even those who profess to employ the Historical Method often omit the deductive half of it; and of course 'practical politicians' boast of their entire contentment with what they call 'the facts.'

Sometimes, however, politicians, venturing upon deductive reasoning, have fallen into the opposite error of omitting to test their results by any comparison with the facts: arguing from certain 'Rights of Man,' or 'Interests of Classes,' or 'Laws of Supply and Demand,' that this or that event will happen, or ought to happen, without troubling themselves to observe whether it does happen or ever has happened. This method of Deduction without any empirical verification, is called by Mill the Geometrical; and, plainly, it can be trustworthy only where there is no actual conflict of forces to be considered. In pure mathematical reasoning about space, time, and number, provided the premises and the reasoning be correct, verification by a comparison with the facts may be needless, because there is no possibility of counteraction. But when we deal with actual causes, no computation of their effects can be relied upon without comparing our conclusions with the facts: not even in Astronomy and Physics, least of all in Politics.

Burke, then, has well said that "without the guide and light of sound, well-understood principles all our reasoning in politics, as in everything else, would be only a confused jumble of particular facts and details without the means of drawing any sort of theoretical or practical conclusion"; but that, on the other hand, the statesman, who does not take account of circumstances, infinite and infinitely combined, "is not erroneous, but stark mad--he is metaphysically mad" (_On the Petition of the Unitarians_). There is, or ought to be, no logical difference between the evidence required by a statesman and that appealed to by a philosopher; and since, as we have seen, the combination of principles with circumstances cannot, in solving problems of social science, be made with the demonstrative precision that belongs to astronomical and physical investigations, there remains the Historical Method as above described.

Examples of the empirical laws from which this method begins abound in histories, newspapers, and political discussions, and are of all shades of truth or half-truth: as that 'History consists in the biographies of great men'; in other words, that the movements of society are due to exceptional personal powers, not to general causes; That at certain epochs great men occur in groups; That every Fine Art passes through periods of development, culmination and decline; That Democracies tend to change into Despotisms; That the possession of power, whether by classes or despots, corrupts the possessor: That 'the governments most distinguished for sustained vigour and abilities have generally been aristocracies'; That 'revolutions always begin in hunger'; That civilisation is inimical to individuality; That the civilisation of the country proceeds from the town; That 'the movement of progressive societies has hitherto been a movement from _Status_ to _Contract_ (i.e., from a condition in which the individual's rights and duties depend on his caste, or position in his family as slave, child, or patriarch, to a condition in which his rights and duties are largely determined by the voluntary agreements he enters into)'; and this last is treated by H. Spencer as one aspect of the law first stated by Comte, that the progress of societies is from the military to the industrial state.

The deductive process we may illustrate by Spencer's explanation of the co-existence in the military state of those specific characters, the inductive proof of which furnished an illustration of the method of Agreement (ch. xvi. Sec. 1). The type of the military State involves the growth of the warrior class, and the treatment of labourers as existing solely to support the warriors; the complete subordination of all individuals to the will of the despotic soldier-king, their property, liberty and life being at the service of the State; the regimentation of society, not only for military, but also for civil purposes; the suppression of all private associations, etc. Now all these characteristics arise from their utility for the purpose of war, a utility amounting to necessity if war is the State's chief purpose. For every purpose is best served when the whole available force co-operates toward it: other things equal, the bigger the army the better; and to increase it, men must be taken from industry, until only just enough remain to feed and equip the soldiers. As this arrangement is not to everybody's taste, there must be despotic control; and this control is most effective through regimentation by grades of command. Private associations, of course, cannot live openly in such a State, because they may have wills of their own and are convenient for conspiracy. Thus the induction of characteristics is verified by a deduction of them from the nature of the case.

Sec. 6. The greater indefiniteness of the Historical compared with the Physical Method, both in its inductions and in its deductions, makes it even more difficult to work with. It wants much sagacity and more impartiality; for the demon of Party is too much with us. Our first care should be to make the empirical law as nearly true as possible, collecting as many as we can of the facts which the law is supposed to generalise, and examining them according to the canons of Induction, with due allowance for the imperfect applicability of those canons to such complex, unwieldy, and indefinite instances. In the examples of such laws given above, it is clear that in some cases no pains have been taken to examine the facts. What is the inductive evidence that Democracies change into Despotisms; that revolutions always begin in hunger; or that civilisation is inimical to individuality? Even Mill's often quoted saying, "that the governments remarkable in history for sustained vigour and ability have generally been aristocracies," is oddly

over-stated. For if you turn to the passage (_Rep. Gov._ chap. vi.), the next sentence tells you that such governments have always been aristocracies of public functionaries; and the next sentence but one restricts, apparently, the list of such remarkable governments to two--Rome and Venice. Whence, then, comes the word "generally" into Mill's law?

As to deducing our empirical law from a consideration of the nature of the case, it is obvious that we ought--(a) to take account of all the important conditions; (b) to allow weight to them severally in proportion to their importance; and (c) not to include in our estimates any condition which we cannot show to be probably present and operative. Thus the Great-Man-Theory of history must surely be admitted to assign a real condition of national success. The great man organises, directs, inspires: is that nothing? On the other hand, to recognise no other condition of national success is the manifest frenzy of a mind in the mythopoeic age. We must allow the great man his due weight, and then inquire into the general conditions that (a) bring him to birth in one nation rather than another, and (b) give him his opportunity.

Mill's explanation of the success of the aristocratic governments of Rome and Venice is, that they were, in fact, bureaucracies; that is to say, their members were trained in the science and art of administration and command. Here, again, we have, no doubt, a real condition; but is it the only one? The popular mind, which little relishes the scaling down of Mill's original law to those two remote cases, is persuaded that an aristocracy is the depository of hereditary virtue, especially with reference to government, and would at once ascribe to this circumstance the greater part of the success of any aristocratic constitution. Now, if the effects of training are inherited, they must, in an hereditary aristocracy, increase the energy of the cause assigned by Mill; but, if not, such heredity is a condition "not present or not operative." Still, if families are ennobled for their extraordinary natural powers of administration or command (as sometimes happens), it is agreed on all hands that innate qualities are inheritable; at least, if care be taken to intermarry with families similarly distinguished, and if by natural or artificial selection all the failures among the offspring be eliminated. The Spartans had some crude notion of both these precautions; and if such measures had been widely adopted, we might deduce from the doctrine of heredity a probability in favour of Mill's original proposition, and thereby verify it in its generality, if it could be collected from the facts.

The Historical Method may be further illustrated by the course adopted in that branch of Social Science which has been found susceptible of the most extensive independent development, namely, Economics. First, by way of contrast, I should say that the abstract, or theoretical treatment of Economics follows the Physical Method; because, as Mill explains, although the phenomena of industry are no doubt influenced, like other social affairs, by all the other circumstances of Society, government, religion, war, art, etc.; yet, where industry is most developed, as in England and the United States, certain special conditions affecting it are so much the most important that, for the purpose at least of a first outline of the science, they may conveniently be considered as the only ones. These conditions are: (1) the general disposition of men to obtain wealth with as little trouble as possible, and (2) to spend it so as to obtain the greatest satisfaction of their various desires; (3) the facts that determine population; and (4) the tendency of extractive industry, when pushed beyond a certain limit without any improvement in the industrial arts, to yield "diminishing returns." From these premises it is easy to infer the general laws of prices, of wages and interest (which are the prices of labour and of the use of capital), and of rent; and it remains to verify these laws by comparing them with the facts in each case; and (if they fail to agree with the facts) to amend them, according to the Method of Residues, by taking account of those influential conditions which were omitted from the first draft of the theory.

Whilst, however, this is usually the procedure of those inquirers who have done most to give Economics its scientific character, to insist that no other plan shall be adopted would be sheer pedantry; and Dr. Keynes has shown, in his _Scope and Method of Political Economy_, that Mill has himself sometimes solved economic problems by the Historical Method. With an analysis of his treatment of Peasant Proprietorship (_Political Economy_, B. II., cc. 7 and 8) we may close this section. Mill first shows inductively, by collecting evidence from Switzerland, Germany, Norway, Belgium, and France (countries differing in race, government, climate and situation), that peasant proprietors are superhumanly industrious; intelligent cultivators, and generally intelligent men; prudent, temperate, and independent, and that they exercise self-control in avoiding improvident marriages. This group of empirical generalisations as to the character of peasant proprietors he then deduces from the nature of the case: their industry, he says, is a natural consequence of the fact that, however much they produce, it is all their own; they cultivate intelligently, because for generations they have given their whole mind to it; they are generally intelligent men, because the variety of work involved in small farming, requiring foresight and calculation, necessarily promotes intelligence; they are prudent, because they have something to save, and by saving can improve their station and perhaps buy more land; they are temperate, because intemperance is incompatible with industry and prudence; they are independent, because secure of the necessaries of life, and from having property to fall back upon; and they avoid improvidence in marriage, because the extent and fertility of their fields is always plainly

before them, and therefore how many children they can maintain is easily calculated. The worst of them is that they work too hard and deny themselves too much: but, over the greater part of the world, other peasantry work too hard; though they can scarcely be said to deny themselves too much; since all their labour for others brings them no surplus to squander upon self-indulgence.

Sec. 7. The foregoing account of the Historical Method is based upon Mill's discussions in B. VI. of his _Logic_, especially cc. 6 to 11. Mill ascribes to Comte the first clear statement of the method; and it is highly scientific, and important in generalising the connections of historical events. But perhaps the expression, 'Historical Method,' is more frequently applied to the Comparative Method, as used in investigating the history of institutions or the true sense of legends.

(1) Suppose we are trying to explain the institution of capital punishment as it now exists in England. (1) We must try to trace the history of it back to the earliest times; for _social custom and tradition is one line of causation_. At present the punishment of death is legally incident only to murder and high treason. But early in the last century malefactors were hung for forgery, sheep-stealing, arson and a long list of other offences down to pocket-picking: earlier still the list included witchcraft and heresy. At present hanging is the only mode of putting a malefactor to death; but formerly the ways of putting to death included also burning, boiling, pressing, beheading, and mixed modes. Before the Restoration, however, the offences punishable with death were far fewer than they afterwards became; and until the twelfth century, the penalty of death might be avoided by paying compensation, the wer-geld.

(2) Every change in the history of an institution must be explained by pointing to _the special causes_ in operation during the time when the change was in progress. Thus the restriction of the death penalty, in the nineteenth century, to so few offences was due partly to the growth of humane feelings, partly to the belief that the infliction, or threat, of the extreme penalty had failed to enforce the law and had demoralised the administration of Justice. The continual extension of the death penalty throughout the eighteenth century may be attributed to a belief that it was the most effectual means of deterring evil-doers when the means of detecting and apprehending criminals were feeble and ill-organised. The various old brutal ways of execution were adopted sometimes to strike terror, sometimes for vengeance, sometimes from horror of the crime, or even from 'conscientious scruples';--which last were the excuse for preferring the burning of heretics to any sort of bloodshed.

(3) The causes of any change in the history of an institution in any country may not be directly discoverable: they must then be investigated by the Comparative Method. Again, the recorded history of a nation, and of all its institutions, followed backwards, comes at last to an end: then the antecedent history must also be supplied by the Comparative Method; whose special use is to indicate the existence of facts for which there is no direct evidence.

This method rests upon the principle that where the causes are alike the effects will be alike, and that similar effects are traceable to similar causes. Every department of study--Astronomy, Chemistry, Zoology, Sociology--is determined by the fact that the phenomena it investigates have certain common characteristics; and we are apt to infer that any process observed in some of these phenomena, if depending on those common characteristics, will be found in others. For example, the decomposition, or radio-activity, of certain elements prepares one to believe that all elements may exhibit it. Where the properties of an object are known to be closely interdependent, as in the organisation of plants, animals and societies, we are especially justified in inferring from one case to another. The whole animal Kingdom has certain common characters--the metabolic process, dependence upon oxygen, upon vegetable food (ultimately), heredity, etc., and, upon this ground, any process (say, the differentiation of species by Natural Selection) that has been established for some kinds of animal is readily extended to others. If instead of the whole animal Kingdom we take some district of it--Class, Order, Family--our confidence in such inferences increases; because the common characters are more numerous and the conditions of life are more alike; or, in other words, the common causes are more numerous that initiate and control the development of nearly allied animals. For such reasons a few fragmentary remains of an extinct animal enable the palaeontologist to reconstruct with some probability an outline of its appearance, organisation, food, habitat and habits.

Applied to History, the Comparative Method rests upon an assumption (which the known facts of (say) 6,000 years amply justify) that human nature, after attaining a recognisable type as _homo sapiens_, is approximately uniform in all countries and in all ages, though more especially where states of culture are similar. Men living in society are actuated by similar motives and reasons in similar ways; they are all dependent upon the supply of food and therefore on the sun and the seasons and the weather and upon means of making fire, and so on. Accordingly, they entertain similar beliefs, and develop similar institutions through similar series of changes. Hence, if in one nation some institution has been altered for reasons that we cannot directly discover, whereas we know the reasons why a similar change was adopted elsewhere, we may conjecture with more or less probability, after making allowance for differences in other circumstances, that the motives or causes in the former case were similar to those in the latter, or in any cases that are better known. Or, again, if in one nation we cannot trace an institution beyond a certain point, but can show that

elsewhere a similar institution has had such or such an antecedent history, we may venture to reconstruct with more or less probability the earlier history of that institution in the nation we are studying.

Amongst the English and Saxon tribes that settled in Britain, death was the penalty for murder, and the criminal was delivered to the next-of-kin of his victim for execution; he might, however, compound for his crime by paying a certain compensation. Studying the history of other tribes in various parts of the world, we are able, with much probability, to reconstruct the antecedents of this death-penalty in our own prehistoric ages, and to trace it to the blood-feud; that is, to a tribal condition in which the next-of-kin of a murdered man was socially and religiously bound to avenge him by slaying the murderer or one of his kindred. This duty of revenge is sometimes (and perhaps was at first everywhere) regarded as necessary to appease the ghost of the victim; sometimes as necessary to compensate the surviving members of his family. In the latter case, it is open to them to accept compensation in money or cattle, etc. Whether the kin will be ready to accept compensation must depend upon the value they set upon wealth in comparison with revenge; but for the sake of order and tribal strength, it is the interest of the tribe, or its elders, or chieftain, to encourage or even to enforce such acceptance. It is also their interest to take the questions--whether a crime has been committed, by whom, and what compensation is due--out of the hands of the injured party, and to submit them to some sort of court or judicial authority. At first, following ancient custom as much as possible, the act of requital, or the choice of accepting compensation, is left to the next-of-kin; but with the growth of central power these things are entrusted to ministers of the Government. Then revenge has undergone its full transformation into punishment. Very likely the wrong itself will come to be treated as having been done not to the kindred of the murdered man, but to the State or the King, as in fact a "breach of the King's peace." This happened in our own history.

(4) The Comparative Method assumes that human nature is approximately the same in different countries and ages; but, of course, 'approximately' is an important word. Although there is often a striking and significant resemblance between the beliefs and institutions of widely separated peoples, we expect to draw the most instructive parallels between those who are nearly related by descent, or neighbourhood, or culture. To shed light upon our own manners, we turn first to other Teutons, then to Slavonians and Kelts, or other Aryans, and so on; and we prefer evidence from Europe to examples from Africa.

(5) As to national culture, that it exhibits certain 'stages' of development is popularly recognised in the distinction drawn between savages, barbarians and civilised folk. But the idea remains rather vague; and there is not space here to define it. I refer, therefore, to the classifications of stages of culture given by A. Sutherland, (_Origin and Growth of Moral Instinct_, Vol. I, p. 103), and L.T. Hobhouse (_Morals in Evolution_, c. 2). That in any 'state of Society,' its factors--religion, government, science, etc.--are mutually dependent, was a leading doctrine with Comte, adopted by Mill. There must be some truth in it; but in some cases we do not understand social influences sufficiently well to trace the connection of factors; and whilst preferring to look for historical parallels between nations of similar culture, we find many cases in which barbarous or savage customs linger in a civilised country.

(6) It was another favourite doctrine with Comte, also adopted by Mill--that the general state of culture is chiefly determined by the prevailing intellectual condition of a people, especially by the accepted ground of explanation--whether the will of supernatural beings, or occult powers, or physical antecedents: the "law of three stages," Fetichism, Metaphysics, Positivism. And this also is, at least, so far true, that it is useless to try to interpret the manners and institutions of any nation until we know its predominant beliefs. Magic and animism are beliefs everywhere held by mankind in early stages of culture, and they influence every action of life. But that is not all: these beliefs retain their hold upon great multitudes of civilised men and affect the thoughts of the most enlightened. Whilst the saying 'that human nature is the same in all ages' seems to make no allowance for the fact that, in some nations, a considerable number of individuals has attained to powers of deliberation, self-control, and exact reasoning, far above the barbarous level, it is yet so far true that, even in civilised countries, masses of people, were it not for the example and instruction of those individuals, would fall back upon magic and animism and the manners that go with those beliefs. The different degrees of enlightenment enjoyed by different classes of the population often enable the less educated to preserve a barbarous custom amidst many civilised characteristics of the national life.

Sec. 8. Historical reasoning must start from, or be verified by, observations. If we are writing the history of ourselves: if of another time or country, we can observe some of the present conditions of the country, its inhabitants, language, manners, institutions, which are effects of the past and must be traceable to it; we may also be able to observe ancient buildings or their ruins, funerary remains, coins, dating from the very times we are to treat of. Our own observations, of course, are by no means free from error.

But even in treating of our own age and country, most of our information must be derived from the testimony of others, who may have made mistakes of observation and further mistakes in reporting their observations, or may have intentionally falsified them.

Testimony is of two kinds: Oral; and Written, inscribed or printed. In investigating the events of a remote age, nearly all our direct evidence must be some sort of testimony.

(1) Oral testimony depends upon the character of the witness; and the best witness is not perfectly trustworthy; for he may not have observed accurately, or he may not have reported correctly; especially if some time elapsed between the event and his account of it; for no man's memory is perfect. Since witnesses vary widely in capacity and integrity, we must ask concerning any one of them--was he a good judge of what he saw, and of what was really important in the event? Had he good opportunities of knowing the circumstances? Had he any interest in the event--personal, or partisan, or patriotic? Such interests would colour his report; and so would the love of telling a dramatic story, if that was a weakness of his. Nay, a love of truth might lead him to modify the report of what he remembered if--as he remembered it--the matter seemed not quite credible. We must also bear in mind that, for want of training, precision in speaking the truth is not understood or appreciated by many honest people even now, still less in unscientific ages.

Oral tradition is formed by passing a report from one to another, generation by generation; and it is generally true that such a tradition loses credit at every step, because every narrator has some weakness. However, the value of tradition depends upon the motives people have to report correctly, and on the form of the communication, and on whether monuments survive in connection with the story. Amongst the things best remembered are religious and magic formulae, heroic poems, lists of ancestors, popular legends about deeply impressive events, such as migrations, conquests, famines, plagues. We are apt now to underrate the value of tradition, because the use of writing has made tradition less important, and therefore less pains are taken to preserve it. In the middle of last century, it was usual (and then quite justifiable) to depreciate oral tradition as nearly worthless; but the spread of archaeological and anthropological research, and the growth of the Comparative Method, have given new significance to legends and traditions which, merely by themselves, could not deserve the slightest confidence.

(2) As to written evidence, contemporary inscriptions--such as are found on rocks and stones and bricks in various parts of the world, and most abundantly in Egypt and Western Asia--are of the highest value, because least liable to fraudulent abuse; but must be considered with reference to the motives of those who set them forth. Manuscripts and books give rise to many difficulties. We have to consider whether they were originally written by some one contemporary with the events recorded: if so they have the same value as immediate oral testimony, provided they have not been tampered with since. But if not contemporary records, they may have been derived from other records that were contemporary, or only from oral tradition. In the latter case they are vitiated by the weakness of oral tradition. In the former case, we have to ask what was the trustworthiness of the original records, and how far do the extant writings fairly represent those records?

Our answers to these questions will partly depend upon what we know or can discover of the authors of the MSS. or books. Who was the author? If a work bears some man's name, did he really write it? The evidence bearing upon this question is usually divided into internal, external and mixed; but perhaps no evidence is purely internal, if we define it as that which is derived entirely from the work itself. Under the name of internal evidence it is usual to put the language, the style, consistency of ideas; but if we had no grounds of judgment but the book itself, we could not possibly say whether the style was the author's: this requires us to know his other works. Nor could we say whether the language was that of his age, unless we knew other literature of the same age; nor even that different passages seem to be written in the manner of different ages, but for our knowledge of change in other literatures. There must in every case be some external reference. Thus we judge that a work is not by the alleged author, nor contemporary with him, if words are used that only became current at a later date, or are used in a sense that they only later acquired, or if later writers are imitated, or if events are mentioned that happened later ('anachronism'). Books are sometimes forged outright, that is, are written by one man and deliberately fathered upon another; but sometimes books come to be ascribed to a well-known name, which were written by some one else without fraudulent intent, dramatically or as a rhetorical exercise.

As to external evidence, if from other sources we have some knowledge of the facts described in a given book, and if it presents no serious discrepancies with those facts, this is some confirmation of a claim to contemporaneity. But the chief source of external evidence is other literature, where we may find the book in question referred to or quoted. Such other literature may be by another author, as when Aristotle refers to a dialogue of Plato's, or Shakespeare quotes Marlowe; or may be other work of the author himself, as when Aristotle in the _Ethics_ refers to his own _Physics_, or Chaucer in _The Canterbury Tales_ mentions as his own _The Legend of Good Women_, and in _The Legend_ gives a list of other works of his. This kind of argument assumes that the authorship of the work we start from is undisputed; which is practically the case with the _Ethics_ and _The Canterbury Tales_.

But, now, granting that a work is by a good author, or contemporary with the events recorded, or healthily related to others that were contemporary, it remains to consider whether it has been well preserved and is likely to retain its original sense. It is, therefore, desirable to know the history of a book or MS., and through whose hands it has passed. Have there been opportunities of tampering with it; and have there been motives to do so? In reprinting books, but still more in copying MSS., there are opportunities of omitting or interpolating passages, or of otherwise altering the sense. In fact, slight changes are almost sure to be made even without meaning to make them, especially in copying MSS., through the carelessness or ignorance of transcribers. Hence the oldest MS. is reckoned the best.

If a work contains stories that are physically impossible, it shows a defect of judgment in the author, and decreases our confidence in his other statements; but it does not follow that these others are to be rejected. We must try to compare them with other evidence. Even incredible stories are significant: they show what people were capable of believing, and, therefore, under what conditions they reasoned and acted. One cause of the incredibility of popular stories is the fusion of legend with myth. A legend is a traditionary story about something that really happened: it may have been greatly distorted by stupidity, or exaggeration, or dramatisation, or rationalisation, but may still retain a good deal of the original fact. A myth, however, has not necessarily any basis of fact: it may be a sort of primitive philosophy, an hypothesis freely invented to explain some fact in nature, such as eclipses, or to explain some social custom whose origin is forgotten, such as the sacrificing of a ram.

All historical conclusions, then, depend on a sum of convergent and conflicting probabilities in the nature of circumstantial evidence. The best testimony is only highly probable, and it is always incomplete. To complete the picture of any past age there is no resource but the Comparative Method. We use this method without being aware of it, whenever we make the records of the last generation intelligible to ourselves by our own experience. Without it nothing would be intelligible: an ancient coin or weapon would have no meaning, were we not acquainted with the origins and uses of other coins and weapons. Generally, the further we go back in history, the more the evidence needs interpretation and reconstruction, and the more prominent becomes the appeal to the Comparative Method. Our aim is to construct a history of the world, and of the planet as part of the world, and of mankind as part of the life of the planet, in such a way that every event shall be consistent with, and even required by, the rest according to the principle of Causation.

CHAPTER XVIII

HYPOTHESES

Sec. 1. An Hypothesis, sometimes employed instead of a known law, as a premise in the deductive investigation of nature, is defined by Mill as "any supposition which we make (either without actual evidence, or on evidence avowedly insufficient) in order to endeavour to deduce from it conclusions in accordance with facts which are known to be real; under the idea that if the conclusions to which the hypothesis leads are known truths, the hypothesis itself either must be, or at least is likely to be, true." The deduction of known truths from an hypothesis is its Verification; and when this has been accomplished in a good many cases, and there are no manifest failures, the hypothesis is often called a Theory; though this term is also used for the whole system of laws of a certain class of phenomena, as when Astronomy is called the 'theory of the heavens.' Between hypothesis and theory in the former sense no distinct line can be drawn; for the complete proof of any speculation may take a long time, and meanwhile the gradually accumulating evidence produces in different minds very different degrees of satisfaction; so that the sanguine begin to talk of 'the theory,' whilst the circumspect continue to call it 'the hypothesis.'

An Hypothesis may be made concerning (1) an Agent, such as the ether; or (2) a Collocation, such as the plan of our solar system--whether geocentric or heliocentric; or (3) a Law of an agent's operation, as that light is transmitted by a wave motion of such lengths or of such rates of vibration.

The received explanation of light involves both an agent, the ether, as an all-pervading elastic fluid, and also the law of its operation, as transmitting light in waves of definite form and length, with definite velocity. The agreement between the calculated results of this complex hypothesis and the observed phenomena of light is the chief part of the verification; which has now been so successfully accomplished that we generally hear of the 'Undulatory Theory.' Sometimes a new agent only is proposed; as the planet Neptune was at first assumed to exist in order to account for perturbations in the movements of Uranus, influencing it according to the already established law of gravitation. Sometimes the agents are known, and only the law of their operation is hypothetical, as was at first the case with the law of gravitation itself. For the agents, namely, Earth, falling bodies on the Earth, Moon, Sun, and planets were manifest; and the hypothesis was that their motions might be due to their attracting one another with

a force inversely proportional to the squares of the distances between them. In the Ptolemaic Astronomy, again, there was an hypothesis as to the collocation of the heavenly bodies (namely, that our Earth was the centre of the universe, and that Moon, Sun, planets and stars revolved around her): in the early form of the system there was also an hypothesis concerning agents upon which this arrangement depended (namely, the crystalline spheres in which the heavenly bodies were fixed, though these were afterwards declared to be imaginary); and an hypothesis concerning the law of operation (namely, that circular motion is the most perfect and eternal, and therefore proper to celestial things).

Hypotheses are by no means confined to the physical sciences: we all make them freely in private life. In searching for anything, we guess where it may be before going to look for it: the search for the North Pole was likewise guided by hypotheses how best to get there. In estimating the characters or explaining the conduct of acquaintances or of public men, we frame hypotheses as to their dispositions and principles. 'That we should not impute motives' is a peculiarly absurd maxim, as there is no other way of understanding human life. To impute bad motives, indeed, when good are just as probable, is to be wanting in the scientific spirit, which views every subject in 'a dry light.' Nor can we help 'judging others by ourselves'; for self-knowledge is the only possible starting-point when we set out to interpret the lives of others. But to understand the manifold combinations of which the elements of character are susceptible, and how these are determined by the breeding of race or family under various conditions, and again by the circumstances of each man's life, demands an extraordinary union of sympathetic imagination with scientific habits of thought. Such should be the equipment of the historian, who pursues the same method of hypothesis when he attempts to explain (say) the state of parties upon the Exclusion Bill, or the policy of Louis XI. Problems such as the former of these are the easier; because, amidst the compromises of a party, personal peculiarities obliterate one another, and expose a simpler scheme of human nature with fewer fig-leaves. Much more hazardous hypotheses are necessary in interpreting the customs of savages, and the feelings of all sorts of animals. Literary criticisms, again, abound with hypotheses: e.g., as to the composition of the Homeric poems, the order of the Platonic dialogues, the authorship of the Caedmonic poems, or the Ossianic, or of the letters of Junius. Thus the method of our everyday thoughts is identical with that of our most refined speculations; and in every case we have to find whether the hypothesis accounts for the facts.

Sec. 2. It follows from the definition of an hypothesis that none is of any use that does not admit of verification (proof or disproof), by comparing the results that may be deduced from it with facts or laws. If so framed as to elude every attempt to test it by facts, it can never be proved by them nor add anything to our understanding of them.

Suppose that a conjurer asserts that his table is controlled by the spirit of your deceased relative, and makes it rap out an account of some adventure that could not easily have been within a stranger's knowledge. So far good. Then, trying again, the table raps out some blunder about your family which the deceased relative could not have committed; but the conjurer explains that 'a lying spirit' sometimes possesses the table. This amendment of the hypothesis makes it equally compatible with success and with failure. To pass from small things to great, not dissimilar was the case of the Ptolemaic Astronomy: by successive modifications, its hypothesis was made to correspond with accumulating observations of the celestial motions so ingeniously that, until the telescope was invented, it may be said to have been unverifiable. Consider, again, the sociological hypothesis, that civil order was at first founded on a Contract which remains binding upon all mankind: this is reconcilable with the most opposite institutions. For we have no record of such an event: and if the institutions of one State (say the British) include ceremonies, such as the coronation oath and oath of allegiance, which may be remnants of an original contract, they may nevertheless be of comparatively recent origin; whereas if the institutions of another State (say the Russian) contain nothing that admits of similar interpretation, yet traces of the contract once existing may long since have been obliterated. Moreover, the actual contents of the contract not having been preserved, every adherent of this hypothesis supplies them at his own discretion, 'according to the dictates of Reason'; and so one derives from it the duty of passive obedience, and another with equal cogency establishes the right of rebellion.

To be verifiable, then, an hypothesis must be definite; if somewhat vague in its first conception (which is reasonably to be expected), it must be made definite in order to be put to the proof. But, except this condition of verifiability, and definiteness for the sake of verifiability, without which a proposition does not deserve the name of an hypothesis, it seems inadvisable to lay down rules for a 'legitimate' hypothesis. The epithet is misleading. It suggests that the Logician makes rules for scientific inquirers; whereas his business is to discover the principles which they, in fact, employ in what are acknowledged to be their most successful investigations. If he did make rules for them, and they treated him seriously, they might be discouraged in the exercise of that liberty of hypothesising which is the condition of all originality; whilst if they paid no attention to him, he must suffer some loss of dignity. Again, to say that a 'legitimate hypothesis' must explain all the facts, at least in the department for which it is invented, is decidedly discouraging. No doubt it may be expected to do this in the long run when (if ever) it is completely established; but this

may take a long time: is it meanwhile illegitimate? Or can this adjective be applied to Newton's corpuscular theory of light, even though it has failed to explain all the facts?

Sec. 3. Given a verifiable hypothesis, however, what constitutes proof or disproof?

(1) _If a new agent be proposed, it is desirable that we should be able directly to observe it, or at least to obtain some evidence of its existence of a different kind from the very facts which it has been invented to explain._ Thus, in the discovery of Neptune, after the existence of such a planet outside the orbit of Uranus had been conjectured (to account for the movements of the latter), the place in the heavens which such a body should occupy at a certain time was calculated, and there by means of the telescope it was actually seen.

Agents, however, are assumed and reasoned upon very successfully which, by their nature, never can be objects of perception: such are the atoms of Chemistry and the ether of Optics. But the severer methodologists regard them with suspicion: Mill was never completely convinced about the ether; the defining of which has been found very difficult. He was willing, however, to make the most of the evidence that has been adduced as indicating a certain property of it distinct from those by which it transmits radiation, namely, mechanical inertia, whereby it has been supposed to retard the career of the heavenly bodies, as shown especially by the history of Encke's comet. This comet returned sooner than it should, as calculated from the usual data; the difference was ascribed to the influence of a resisting medium in reducing the extent of its orbit; and such a medium may be the ether. If this conjecture (now of less credit) should gain acceptance, the ether might be regarded as a _vera causa_ (that is, a condition whose existence may be proved independently of the phenomena it was intended to explain), in spite of its being excluded by its nature from the sphere of direct perception. However, science is not a way of perceiving things, but essentially a way of thinking about them. It starts, indeed, from perception and returns to it, and its thinking is controlled by the analogies of perception. Atoms and ether are thought about as if they could be seen or felt, not as noumena; and if still successful in connecting and explaining perceptions, and free from contradiction, they will stand as hypotheses on that ground.

On the other hand, a great many agents, once assumed in order to explain phenomena, have since been explained away. Of course, a _fact_ can never be 'explained away': the phrase is properly applicable to the fate of erroneous hypotheses, when, not only are they disproved, but others are established in their places. Of the Aristotelian spheres, which were supposed to support and translate sun, moon and planets, no trace has ever been found: they would have been very much in the way of the comets. Phlogiston, again, an agent much in favour with the earlier Chemists, was found, Whewell tells us, when their theories were tested by exact weighing, to be not merely non-existent but a minus quantity; that is to say, it required the assumption of its absolute lightness "so that it diminished the weight of the compounds into which it entered." These agents, then, the spheres and phlogiston, have been explained away, and instead of them we have the laws of motion and oxygen.

(2) _Whether the hypothetical agent be perceptible or not, it cannot be established as a cause, nor can a supposed law of such an agent be accepted as sufficient to the given inquiry, unless it is adequate to account for the effects which it is called upon to explain, at least so far as it pretends to explain them._ The general truth of this is sufficiently obvious, since to explain the facts is the purpose of an hypothesis; and we have seen that Newton gave up his hypothesis that the moon was a falling body, as long as he was unable to show that the amount of its deflection from a tangent (or fall) in a given time, was exactly what it should be, if the Moon was controlled by the same force as falling bodies on the Earth.

It is important to observe the limitations to this canon. In the first place, it says that, unless adequate to explain the facts in question, an hypothesis cannot be '_established_'; but, for all that, such an hypothesis may be a very promising one, not to be hastily rejected, since it may take a very long time fully to verify an hypothesis. Some facts may not be obtainable that are necessary to show the connection of others: as, for example, the hypothesis that all species of animals have arisen from earlier ones by some process of gradual change, can be only imperfectly verified by collecting the fossil remains of extinct species, because immense depths and expanses of fossiliferous strata have been destroyed. Or, again, the general state of culture may be such as to prevent men from tracing the consequences of an hypothesis; for which reason, apparently, the doctrine that the Sun is the centre of our planetary system remained a discredited hypothesis for 2000 years. This should instruct us not to regard an hypothesis as necessarily erroneous or illegitimate merely because we cannot yet see how it works out: but neither can we in such a case regard it as established, unless we take somebody's word for it.

Secondly, the canon says that an hypothesis is not established, unless it accounts for the phenomena _so far as it professes to_. But it implies a complete misunderstanding to assail a doctrine for not explaining what lies beyond its scope. Thus, it is no objection

to a theory of the origin of species, that it does not explain the origin of life: it does not profess to. For the same reason, it is no objection to the theory of Natural Selection, that it does not account for the variations which selection presupposes. But such objections might be perfectly fair against a general doctrine of Evolution.

An interesting case in Wallace's _Darwinism_ (chap. x.) will illustrate the importance of attending to the exact conditions of an hypothesis. He says that in those groups of "birds that need protection from enemies," "when the male is brightly coloured and the female sits exposed on the nest, she is always less brilliant and generally of quite sober and protective hues"; and his hypothesis is, that these sober hues have been acquired or preserved by Natural Selection, because it is important to the family that the sitting bird should be inconspicuous. Now to this it might be objected that in some birds both sexes are brilliant or conspicuous; but the answer is that the female of such species _does not sit exposed on the nest_; for the nests are either domed over, or made in a hole; so that the sitting bird does not need protective colouring. If it be objected, again, that some sober-coloured birds build domed nests, it may be replied that the proposition 'All conspicuously coloured birds are concealed in the nest,' is not to be converted simply into 'All birds that sit concealed in the nest are conspicuously coloured.' In the cases alleged the domed nests are a protection against the weather, and the sober colouring is a general protection to the bird, which inhabits an open country. It may be urged, however, that jays, crows, and magpies are conspicuous birds, and yet build open nests: but these are aggressive birds, _not needing protection from enemies_. Finally, there are cases, it must be confessed, in which the female is more brilliant than the male, and which yet have open nests. Yes: but _then the male sits upon the eggs_, and the female is stronger and more pugnacious!

Thus every objection is shown to imply some inattention to the conditions of the hypothesis; and in each case it may be said, _exceptio probat regulam_--the exception _tests_ the rule. (Of course, the usual translation "proves the rule," in the restricted modern sense of "prove," is absurd.) That is to say, it appears on examination: (1) that the alleged exception is not really one, and (2) that it stands in such relation to the rule as to confirm it. For to all the above objections it is replied that, granting the phenomenon in question (special protective colouring for the female) to be absent, the alleged cause (need of protection) is also absent; so that the proof is, by means of the objections, extended, from being one by the method of Agreement, into one by the Double Method.

Thirdly, an hypothesis originally intended to account for the whole of a phenomenon and failing to do so, though it cannot be established in that sense, may nevertheless contain an essential part of the explanation. The Neptunian Hypothesis in Geology, was an attempt to explain the formation of the Earth's outer crust, as having been deposited from an universal ocean of mud. In the progress of the science other causes, seismic, fluvial and atmospheric, have been found necessary in order to complete the theory of the history of the Earth's crust; but it remains true that the stratified rocks, and some that have lost their stratified character, were originally deposited under water. Inadequacy, therefore, is not a reason for entirely rejecting an hypothesis or treating it as illegitimate.

(3) Granting that the hypothetical cause is real and adequate, the investigation is not complete. Agreement with the facts is a very persuasive circumstance, the more so the more extensive the agreement, especially if no exceptions are known. Still, if this is all that can be said in favour of an hypothesis, it amounts to proof at most by the method of Agreement; it does not exclude the possibility of vicarious causes; and if the hypothesis proposes a new agent that cannot be directly observed, an equally plausible hypothesis about another imagined agent may perhaps be invented.

According to Whewell, it is a strong mark of the truth of an hypothesis when it agrees with distinct inductions concerning different classes of facts, and he calls this the 'Consilience of Inductions,' because they jump together in the unity of the hypothesis. It is particularly convincing when this consilience takes place easily and naturally without necessitating the mending and tinkering of the hypothesis; and he cites the Theory of Gravitation and the Undulatory Theory of Light as the most conspicuous examples of such ever-victorious hypotheses. Thus, gravitation explains the fall of bodies on the Earth, and the orbits of the planets and their satellites; it applies to the tides, the comets, the double stars, and gives consistency to the Nebular Hypothesis, whence flow important geological inferences; and all this without any need of amendment. Nevertheless, Mill, with his rigorous sense of duty, points out, that an induction is merely a proposition concerning many facts, and that a consilience of inductions is merely a multiplication of the facts explained; and that, therefore, if the proof is merely Agreement in each case, there can be no more in the totality; the possibility of vicarious causes is not precluded; and the hypothesis may, after all, describe an accidental circumstance.

Whewell also laid great stress upon prediction as a mark of a true hypothesis. Thus, Astronomers predict eclipses, occultations, transits, long beforehand with the greatest precision; and the prediction of the place of Neptune by sheer force of deduction is one

of the most astonishing things in the history of science. Yet Mill persisted in showing that a predicted fact is only another fact, and that it is really not very extraordinary that an hypothesis, that happens to agree with many known facts, should also agree with some still undiscovered. Certainly, there seems to be some illusion in the common belief in the probative force of prediction. Prediction surprises us, puts us off our guard, and renders persuasion easy; in this it resembles the force of an epigram in rhetoric. But cases can be produced in which erroneous hypotheses have led to prediction; and Whewell himself produces them. Thus, he says that the Ptolemaic theory was confirmed by its predicting eclipses and other celestial phenomena, and by leading to the construction of Tables in which the places of the heavenly bodies were given at every moment of time. Similarly, both Newton's theory of light and the chemical doctrine of phlogiston led to predictions which came true.

What sound method demands in the proof of an hypothesis, then, is _not merely that it be shown to agree with the facts, but that every other hypothesis be excluded._ This, to be sure, may be beyond our power; there may in some cases be no such negative proof except the exhaustion of human ingenuity in the course of time. The present theory of colour has in its favour the failure of Newton's corpuscular hypothesis and of Goethe's anti-mathematical hypothesis; but the field of conjecture remains open. On the other hand, Newton's proof that the solar system is controlled by a central force, was supported by the demonstration that a force having any other direction could not have results agreeing with Kepler's second law of the planetary motions, namely, that, as a planet moves in its orbit, the areas described by a line drawn from the sun to the planet are proportional to the times occupied in the planet's motion. When a planet is nearest to the sun, the area described by such a line is least for any given distance traversed by the planet; and then the planet moves fastest: when the planet is furthest from the sun, the area described by such a line is greatest for an equal distance traversed; and then the planet moves slowest. This law may be deduced from the hypothesis of a central force, but not from any other; the proof, therefore, as Mill says, satisfies the method of Difference.

Apparently, to such completeness of demonstration certain conditions are necessary: the possibilities must lie between alternatives, such as A or not-A, or amongst some definite list of cases that may be exhausted, such as equal, greater or less. He whose hypothesis cannot be brought to such a definite issue, must try to refute whatever other hypotheses are offered, and naturally he will attack first the strongest rivals. With this object in view he looks about for a "crucial instance," that is, an observation or experiment that stands like a cross (sign-post) at the parting of the ways to guide us into the right way, or, in plain words, an instance that can be explained by one hypothesis but not by another. Thus the phases of Venus, similar to those of the Moon, but concurring with great changes of apparent size, presented, when discovered by Galileo, a crucial instance in favour of the Copernican hypothesis, as against the Ptolemaic, so far at least as to prove that Venus revolved around the Sun inside the orbit of the Earth. ON THE ART OF POETRY

By Aristotle

Translated By Ingram Bywater

With A Preface By Gilbert Murray

Oxford At The Clarendon Press First Published 1920 Reprinted 1925, 1928, 1932, 1938, 1945, 1947 1951, 1954, 1959. 1962 Printed In Great Britain

PREFACE

In the tenth book of the _Republic_, when Plato has completed his final burning denunciation of Poetry, the false Siren, the imitator of things which themselves are shadows, the ally of all that is low and weak in the soul against that which is high and strong, who makes us feed the things we ought to starve and serve the things we ought to rule, he ends with a touch of compunction: 'We will give her champions, not poets themselves but poet-lovers, an opportunity to make her defence in plain prose and show that she is not only sweet--as we well know--but also helpful to society and the life of man, and we will listen in a kindly spirit. For we shall be gainers, I take it, if this can be proved.' Aristotle certainly knew the passage, and it looks as if his treatise on poetry was an answer to Plato's challenge.

Few of the great works of ancient Greek literature are easy reading. They nearly all need study and comment, and at times help from a good teacher, before they yield up their secret. And the _Poetics_ cannot be accounted an exception. For one thing the treatise is fragmentary. It originally consisted of two books, one dealing with Tragedy and Epic, the other with Comedy and other subjects. We possess only the first. For another, even the book we have seems to be unrevised and unfinished. The style, though luminous, vivid, and in its broader division systematic, is not that of a book intended for publication. Like most of Aristotle's extant writing, it suggests the MS. of an experienced lecturer, full of jottings and adscripts, with occasional phrases written carefully out, but never revised as a whole for the general reader. Even to accomplished scholars the meaning is often obscure, as may be seen by a comparison of the three editions recently published in England, all the work of savants of the first eminence, (1) or, still more strikingly, by a study of the long series of misunderstandings and overstatements and corrections which form the history of the _Poetics_ since the Renaissance.

(1) Prof. Butcher, 1895 and 1898; Prof. Bywater, 1909; and Prof. Margoliouth, 1911.

But it is of another cause of misunderstanding that I wish principally to speak in this preface. The great edition from which the present translation is taken was the fruit of prolonged study by one of the greatest Aristotelians of the nineteenth century, and is itself a classic among works of scholarship. In the hands of a student who knows even a little Greek, the translation, backed by the commentary, may lead deep into the mind of Aristotle. But when the translation is used, as it doubtless will be, by readers who are quite without the clue provided by a knowledge of the general habits of the Greek language, there must arise a number of new difficulties or misconceptions.

To understand a great foreign book by means of a translation is possible enough where the two languages concerned operate with a common stock of ideas, and belong to the same period of civilization. But between ancient Greece and modern England there yawn immense gulfs of human history; the establishment and the partial failure of a common European religion, the barbarian invasions, the feudal system, the regrouping of modern Europe, the age of mechanical invention, and the industrial revolution. In an average page of French or German philosophy nearly all the nouns can be translated directly into exact equivalents in English; but in Greek that is not so. Scarcely one in ten of the nouns on the first few pages of the _Poetics_ has an exact English equivalent. Every proposition has to be reduced to its lowest terms of thought and then re-built. This is a difficulty which no translation can quite deal with; it must be left to a teacher who knows Greek. And there is a kindred difficulty which flows from it. Where words can be translated into equivalent words, the style of an original can be closely followed; but no translation which aims at being written in normal English can reproduce the style of Aristotle. I have sometimes played with the idea that a ruthlessly literal translation, helped out by bold punctuation, might be the best. For instance, premising that the words _poesis_, _poetes_ mean originally 'making' and 'maker', one might translate the first paragraph of the _Poetics_ thus:--

MAKING: kinds of making: function of each, and how the Myths ought to be put together if the Making is to go right.

Number of parts: nature of parts: rest of same inquiry.

Begin in order of nature from first principles.

Epos-making, tragedy-making (also comedy), dithyramb-making (and most fluting and harping), taken as a whole, are really not Makings but Imitations. They differ in three points; they imitate (a) different objects, (b) by different means, (c) differently (i.e. different manner).

Some artists imitate (i.e. depict) by shapes and colours. (Obs. sometimes by art, sometimes by habit.) Some by voice. Similarly the above arts all imitate by rhythm, language, and tune, and these either (1) separate or (2) mixed.

Rhythm and tune alone, harping, fluting, and other arts with same effect--e.g. panpipes.

Rhythm without tune: dancing. (Dancers imitate characters, emotions, and experiences by means of rhythms expressed in form.)

Language alone (whether prose or verse, and one form of verse or many): this art has no name up to the present (i.e. there is no name to cover mimes and dialogues and any similar imitation made in iambics, elegiacs, &c. Commonly people attach the 'making' to the metre and say 'elegiac-makers', 'hexameter-makers,' giving them a common class-name by their metre, as if it was not their imitation that makes them 'makers').

Such an experiment would doubtless be a little absurd, but it would give an English reader some help in understanding both Aristotle's style and his meaning.

For example, their enlightenment in the literal phrase, 'how the myths ought to be put together.' The higher Greek poetry did not make up fictitious plots; its business was to express the heroic saga, the myths. Again, the literal translation of _poetes_, poet, as 'maker', helps to explain a term that otherwise seems a puzzle in the _Poetics_. If we wonder why Aristotle, and Plato before him, should lay such stress on the theory that art is imitation, it is a help to realize that common language called it 'making', and it was clearly not 'making' in the ordinary sense. The poet who was 'maker' of a Fall of Troy clearly did not make the real Fall of Troy. He made an imitation Fall of Troy. An artist who 'painted Pericles' really 'made an imitation Pericles by means of shapes and colours'. Hence we get started upon a theory of art which, whether finally satisfactory or not, is of immense importance, and are saved from the error of complaining that Aristotle did not understand the 'creative power' of art.

As a rule, no doubt, the difficulty, even though merely verbal, lies beyond the reach of so simple a tool as literal translation. To say that tragedy 'imitates good men' while comedy 'imitates bad men' strikes a modern reader as almost meaningless. The truth is that neither 'good' nor 'bad' is an exact equivalent of the Greek. It would be nearer perhaps to say that, relatively speaking, you look up to the characters of tragedy, and down upon those of comedy. High or low, serious or trivial, many other pairs of words would have to be called in, in order to cover the wide range of the common Greek words. And the point is important, because we have to consider whether in Chapter VI Aristotle really lays it down that tragedy, so far from being the story of un-happiness that we think it, is properly an imitation of _eudaimonia_--a word often translated 'happiness', but meaning something more like 'high life' or 'blessedness'. (1)

(1) See Margoliouth, p. 121. By water, with most editors, emends the text.

Another difficult word which constantly recurs in the _Poetics_ is _prattein_ or _praxis_, generally translated 'to act' or 'action'. But _prattein_, like our 'do', also has an intransitive meaning 'to fare' either well or ill; and Professor Margoliouth has pointed out that it seems more true to say that tragedy shows how men 'fare' than how they 'act'. It shows their experiences or fortunes rather than merely their deeds. But one must not draw the line too bluntly. I should doubt whether a classical Greek writer was ordinarily conscious of the distinction between the two meanings. Certainly it is easier to regard happiness as a way of faring than as a form of action. Yet Aristotle can use the passive of _prattein_ for things 'done' or 'gone through' (e.g. 52a, 22, 29: 55a, 25).

The fact is that much misunderstanding is often caused by our modern attempts to limit too strictly the meaning of a Greek word. Greek was very much a live language, and a language still unconscious of grammar, not, like ours, dominated by definitions and trained upon dictionaries. An instance is provided by Aristotle's famous saying that the typical tragic hero is one who falls from high state or fame, not through vice or depravity, but by some great _hamartia_. _Hamartia_ means originally a 'bad shot' or 'error', but is currently used for 'offence' or 'sin'. Aristotle clearly means that the typical hero is a great man with 'something wrong' in his life or

character; but I think it is a mistake of method to argue whether he means 'an intellectual error' or 'a moral flaw'. The word is not so precise.

Similarly, when Aristotle says that a deed of strife or disaster is more tragic when it occurs 'amid affections' or 'among people who love each other', no doubt the phrase, as Aristotle's own examples show, would primarily suggest to a Greek feuds between near relations. Yet some of the meaning is lost if one translates simply 'within the family'.

There is another series of obscurities or confusions in the _Poetics_ which, unless I am mistaken, arises from the fact that Aristotle was writing at a time when the great age of Greek tragedy was long past, and was using language formed in previous generations. The words and phrases remained in the tradition, but the forms of art and activity which they denoted had sometimes changed in the interval. If we date the _Poetics_ about the year 330 B.C., as seems probable, that is more than two hundred years after the first tragedy of Thespis was produced in Athens, and more than seventy after the death of the last great masters of the tragic stage. When we remember that a training in music and poetry formed a prominent part of the education of every wellborn Athenian, we cannot be surprised at finding in Aristotle, and to a less extent in Plato, considerable traces of a tradition of technical language and even of aesthetic theory.

It is doubtless one of Aristotle's great services that he conceived so clearly the truth that literature is a thing that grows and has a history. But no writer, certainly no ancient writer, is always vigilant. Sometimes Aristotle analyses his terms, but very often he takes them for granted; and in the latter case, I think, he is sometimes deceived by them. Thus there seem to be cases where he has been affected in his conceptions of fifth-century tragedy by the practice of his own day, when the only living form of drama was the New Comedy.

For example, as we have noticed above, true Tragedy had always taken its material from the sacred myths, or heroic sagas, which to the classical Greek constituted history. But the New Comedy was in the habit of inventing its plots. Consequently Aristotle falls into using the word _mythos_ practically in the sense of 'plot', and writing otherwise in a way that is unsuited to the tragedy of the fifth century. He says that tragedy adheres to 'the historical names' for an aesthetic reason, because what has happened is obviously possible and therefore convincing. The real reason was that the drama and the myth were simply two different expressions of the same religious kernel (p. 44). Again, he says of the Chorus (p. 65) that it should be an integral part of the play, which is true; but he also says that it' should be regarded as one of the actors', which shows to what an extent the Chorus in his day was dead and its technique forgotten. He had lost the sense of what the Chorus was in the hands of the great masters, say in the Bacchae or the Eumenides. He mistakes, again, the use of that epiphany of a God which is frequent at the end of the single plays of Euripides, and which seems to have been equally so at the end of the trilogies of Aeschylus. Having lost the living tradition, he sees neither the ritual origin nor the dramatic value of these divine epiphanies. He thinks of the convenient gods and abstractions who sometimes spoke the prologues of the New Comedy, and imagines that the God appears in order to unravel the plot. As a matter of fact, in one play which he often quotes, the _Iphigenia Taurica_, the plot is actually distorted at the very end in order to give an opportunity for the epiphany.(1)

(1) See my _Euripides and his Age_, pp. 221-45.

One can see the effect of the tradition also in his treatment of the terms Anagnorisis and Peripeteia, which Professor Bywater translates as 'Discovery and Peripety' and Professor Butcher as 'Recognition and Reversal of Fortune'. Aristotle assumes that these two elements are normally present in any tragedy, except those which he calls 'simple'; we may say, roughly, in any tragedy that really has a plot. This strikes a modern reader as a very arbitrary assumption. Reversals of Fortune of some sort are perhaps usual in any varied plot, but surely not Recognitions? The clue to the puzzle lies, it can scarcely be doubted, in the historical origin of tragedy. Tragedy, according to Greek tradition, is originally the ritual play of Dionysus, performed at his festival, and representing, as Herodotus tells us, the 'sufferings' or 'passion' of that God. We are never directly told what these 'sufferings' were which were so represented; but Herodotus remarks that he found in Egypt a ritual that was 'in almost all points the same'. (1) This was the well-known ritual of Osiris, in which the god was torn in pieces, lamented, searched for, discovered or recognized, and the mourning by a sudden Reversal turned into joy. In any tragedy which still retained the stamp of its Dionysiac origin, this Discovery and Peripety might normally be expected to occur, and to occur together. I have tried to show elsewhere how many of our extant tragedies do, as a matter of fact, show the marks of this ritual.(2)

(1) Cf. Hdt. ii. 48; cf. 42,144. The name of Dionysus must not be openly mentioned in connexion with mourning (ib. 61, 132, 86). This may help to explain the transference of the tragic shows to other heroes.

(2) In Miss Harrison's _Themis_, pp. 341-63.

I hope it is not rash to surmise that the much-debated word __katharsis__, 'purification' or 'purgation', may have come into Aristotle's mouth from the same source. It has all the appearance of being an old word which is accepted and re-interpreted by Aristotle rather than a word freely chosen by him to denote the exact phenomenon he wishes to describe. At any rate the Dionysus ritual itself was a _katharmos_ or _katharsis_--a purification of the community from the taints and poisons of the past year, the old contagion of sin and death. And the words of Aristotle's definition of tragedy in Chapter VI might have been used in the days of Thespis in a much cruder and less metaphorical sense. According to primitive ideas, the mimic representation on the stage of 'incidents arousing pity and fear' did act as a _katharsis_ of such 'passions' or 'sufferings' in real life. (For the word _pathemata_ means 'sufferings' as well as 'passions'.) It is worth remembering that in the year 361 B.C., during Aristotle's lifetime, Greek tragedies were introduced into Rome, not on artistic but on superstitious grounds, as a _katharmos_ against a pestilence (Livy vii. 2). One cannot but suspect that in his account of the purpose of tragedy Aristotle may be using an old traditional formula, and consciously or unconsciously investing it with a new meaning, much as he has done with the word _mythos_.

Apart from these historical causes of misunderstanding, a good teacher who uses this book with a class will hardly fail to point out numerous points on which two equally good Greek scholars may well differ in the mere interpretation of the words. What, for instance, are the 'two natural causes' in Chapter IV which have given birth to Poetry? Are they, as our translator takes them, (1) that man is imitative, and (2) that people delight in imitations? Or are they (1) that man is imitative and people delight in imitations, and (2) the instinct for rhythm, as Professor Butcher prefers? Is it a 'creature' a thousand miles long, or a 'picture' a thousand miles long which raises some trouble in Chapter VII? The word _zoon_ means equally 'picture' and 'animal'. Did the older poets make their characters speak like 'statesmen', _politikoi_, or merely like ordinary citizens, _politai_, while the moderns made theirs like 'professors of rhetoric'? (Chapter VI, p. 38; cf. Margoliouth's note and glossary).

It may seem as if the large uncertainties which we have indicated detract in a ruinous manner from the value of the _Poetics_ to us as a work of criticism. Certainly if any young writer took this book as a manual of rules by which to 'commence poet', he would find himself embarrassed. But, if the book is properly read, not as a dogmatic text-book but as a first attempt, made by a man of astounding genius, to build up in the region of creative art a rational order like that which he established in logic, rhetoric, ethics, politics, physics, psychology, and almost every department of knowledge that existed in his day, then the uncertainties become rather a help than a discouragement. They give us occasion to think and use our imagination. They make us, to the best of our powers, try really to follow and criticize closely the bold gropings of an extraordinary thinker; and it is in this process, and not in any mere collection of dogmatic results, that we shall find the true value and beauty of the _Poetics_.

The book is of permanent value as a mere intellectual achievement; as a store of information about Greek literature; and as an original or first-hand statement of what we may call the classical view of artistic criticism. It does not regard poetry as a matter of unanalysed inspiration; it makes no concession to personal whims or fashion or _ennui_. It tries by rational methods to find out what is good in art and what makes it good, accepting the belief that there is just as truly a good way, and many bad ways, in poetry as in morals or in playing billiards. This is no place to try to sum up its main conclusions. But it is characteristic of the classical view that Aristotle lays his greatest stress, first, on the need for Unity in the work of art, the need that each part should subserve the whole, while irrelevancies, however brilliant in themselves, should be cast away; and next, on the demand that great art must have for its subject the great way of living. These judgements have often been misunderstood, but the truth in them is profound and goes near to the heart of things.

Characteristic, too, is the observation that different kinds of art grow and develop, but not indefinitely; they develop until they 'attain their natural form'; also the rule that each form of art should produce 'not every sort of pleasure but its proper pleasure'; and the sober language in which Aristotle, instead of speaking about the sequence of events in a tragedy being 'inevitable', as we bombastic moderns do, merely recommends that they should be 'either necessary or probable' and 'appear to happen because of one another'.

Conceptions and attitudes of mind such as these constitute what we may call the classical faith in matters of art and poetry; a faith which is never perhaps fully accepted in any age, yet, unlike others, is never forgotten but lives by being constantly criticized, re-asserted, and rebelled against. For the fashions of the ages vary in this direction and that, but they vary for the most part from a central road which was struck out by the imagination of Greece.

G. M

ARISTOTLE ON THE ART OF POETRY

1

Our subject being Poetry, I propose to speak not only of the art in general but also of its species and their respective capacities; of the structure of plot required for a good poem; of the number and nature of the constituent parts of a poem; and likewise of any other matters in the same line of inquiry. Let us follow the natural order and begin with the primary facts.

Epic poetry and Tragedy, as also Comedy, Dithyrambic poetry, and most flute-playing and lyre-playing, are all, viewed as a whole, modes of imitation. But at the same time they differ from one another in three ways, either by a difference of kind in their means, or by differences in the objects, or in the manner of their imitations.

I. Just as form and colour are used as means by some, who (whether by art or constant practice) imitate and portray many things by their aid, and the voice is used by others; so also in the above-mentioned group of arts, the means with them as a whole are rhythm, language, and harmony--used, however, either singly or in certain combinations. A combination of rhythm and harmony alone is the means in flute-playing and lyre-playing, and any other arts there may be of the same description, e.g. imitative piping. Rhythm alone, without harmony, is the means in the dancer's imitations; for even he, by the rhythms of his attitudes, may represent men's characters, as well as what they do and suffer. There is further an art which imitates by language alone, without harmony, in prose or in verse, and if in verse, either in some one or in a plurality of metres. This form of imitation is to this day without a name. We have no common name for a mime of Sophron or Xenarchus and a Socratic Conversation; and we should still be without one even if the imitation in the two instances were in trimeters or elegiacs or some other kind of verse--though it is the way with people to tack on 'poet' to the name of a metre, and talk of elegiac-poets and epic-poets, thinking that they call them poets not by reason of the imitative nature of their work, but indiscriminately by reason of the metre they write in. Even if a theory of medicine or physical philosophy be put forth in a metrical form, it is usual to describe the writer in this way; Homer and Empedocles, however, have really nothing in common apart from their metre; so that, if the one is to be called a poet, the other should be termed a physicist rather than a poet. We should be in the same position also, if the imitation in these instances were in all the metres, like the _Centaur_ (a rhapsody in a medley of all metres) of Chaeremon; and Chaeremon one has to recognize as a poet. So much, then, as to these arts. There are, lastly, certain other arts, which combine all the means enumerated, rhythm, melody, and verse, e.g. Dithyrambic and Nomic poetry, Tragedy and Comedy; with this difference, however, that the three kinds of means are in some of them all employed together, and in others brought in separately, one after the other. These elements of difference in the above arts I term the means of their imitation.

2

II. The objects the imitator represents are actions, with agents who are necessarily either good men or bad--the diversities of human character being nearly always derivative from this primary distinction, since the line between virtue and vice is one dividing the whole of mankind. It follows, therefore, that the agents represented must be either above our own level of goodness, or beneath it, or just such as we are in the same way as, with the painters, the personages of Polygnotus are better than we are, those of Pauson worse, and those of Dionysius just like ourselves. It is clear that each of the above-mentioned arts will admit of these differences, and that it will become a separate art by representing objects with this point of difference. Even in dancing, flute-playing, and lyre-playing such diversities are possible; and they are also possible in the nameless art that uses language, prose or verse without harmony, as its means; Homer's personages, for instance, are better than we are; Cleophon's are on our own level; and those of Hegemon of Thasos, the first writer of parodies, and Nicochares, the author of the _Diliad_, are beneath it. The same is true of the Dithyramb and the Nome: the personages may be presented in them with the difference exemplified in the... of... and Argas, and in the Cyclopses of Timotheus and Philoxenus. This difference it is that distinguishes Tragedy and Comedy also; the one would make its personages worse, and the other better, than the men of the present day.

3

III. A third difference in these arts is in the manner in which each kind of object is represented. Given both the same means and the same kind of object for imitation, one may either (1) speak at one moment in narrative and at another in an assumed character, as Homer does; or (2) one may remain the same throughout, without any such change; or (3) the imitators may represent the whole story dramatically, as though they were actually doing the things described.

As we said at the beginning, therefore, the differences in the imitation of these arts come under three heads, their means, their objects, and their manner.

So that as an imitator Sophocles will be on one side akin to Homer, both portraying good men; and on another to Aristophanes, since both present their personages as acting and doing. This in fact, according to some, is the reason for plays being termed dramas, because in a play the personages act the story. Hence too both Tragedy and Comedy are claimed by the Dorians as their discoveries; Comedy by the Megarians--by those in Greece as having arisen when Megara became a democracy, and by the Sicilian Megarians on the ground that the poet Epicharmus was of their country, and a good deal earlier than Chionides and Magnes; even Tragedy also is claimed by certain of the Peloponnesian Dorians. In support of this claim they point to the words 'comedy' and 'drama'. Their word for the outlying hamlets, they say, is comae, whereas Athenians call them demes--thus assuming that comedians got the name not from their _comoe_ or revels, but from their strolling from hamlet to hamlet, lack of appreciation keeping them out of the city. Their word also for 'to act', they say, is _dran_, whereas Athenians use _prattein_.

So much, then, as to the number and nature of the points of difference in the imitation of these arts.

4

It is clear that the general origin of poetry was due to two causes, each of them part of human nature. Imitation is natural to man from childhood, one of his advantages over the lower animals being this, that he is the most imitative creature in the world, and learns at first by imitation. And it is also natural for all to delight in works of imitation. The truth of this second point is shown by experience: though the objects themselves may be painful to see, we delight to view the most realistic representations of them in art, the forms for example of the lowest animals and of dead bodies. The explanation is to be found in a further fact: to be learning something is the greatest of pleasures not only to the philosopher but also to the rest of mankind, however small their capacity for it; the reason of the delight in seeing the picture is that one is at the same time learning--gathering the meaning of things, e.g. that the man there is so-and-so; for if one has not seen the thing before, one's pleasure will not be in the picture as an imitation of it, but will be due to the execution or colouring or some similar cause. Imitation, then, being natural to us--as also the sense of harmony and rhythm, the metres being obviously species of rhythms--it was through their original aptitude, and by a series of improvements for the most part gradual on their first efforts, that they created poetry out of their improvisations.

Poetry, however, soon broke up into two kinds according to the differences of character in the individual poets; for the graver among them would represent noble actions, and those of noble personages; and the meaner sort the actions of the ignoble. The latter class produced invectives at first, just as others did hymns and panegyrics. We know of no such poem by any of the pre-Homeric poets, though there were probably many such writers among them; instances, however, may be found from Homer downwards, e.g. his _Margites_, and the similar poems of others. In this poetry of invective its natural fitness brought an iambic metre into use; hence our present term 'iambic', because it was the metre of their 'iambs' or invectives against one another. The result was that the old poets became some of them writers of heroic and others of iambic verse. Homer's position, however, is peculiar: just as he was in the serious style the poet of poets, standing alone not only through the literary excellence, but also through the dramatic character of his imitations, so too he was the first to outline for us the general forms of Comedy by producing not a dramatic invective, but a dramatic picture of the Ridiculous; his _Margites_ in fact stands in the same relation to our comedies as the _Iliad_ and _Odyssey_ to our tragedies. As soon, however, as Tragedy and Comedy appeared in the field, those naturally drawn to the one line of poetry became writers of comedies instead of iambs, and those naturally drawn to the other, writers of tragedies instead of epics, because these new modes of art were grander and of more esteem than the old.

If it be asked whether Tragedy is now all that it need be in its formative elements, to consider that, and decide it theoretically and in relation to the theatres, is a matter for another inquiry.

It certainly began in improvisations--as did also Comedy; the one originating with the authors of the Dithyramb, the other with those of the phallic songs, which still survive as institutions in many of our cities. And its advance after that was little by little, through their improving on whatever they had before them at each stage. It was in fact only after a long series of changes that the movement of Tragedy stopped on its attaining to its natural form. (1) The number of actors was first increased to two by Aeschylus, who curtailed the business of the Chorus, and made the dialogue, or spoken portion, take the leading part in the play. (2) A third actor and scenery were due to Sophocles. (3) Tragedy acquired also its magnitude. Discarding short stories and a ludicrous diction, through its passing out of its satyric stage, it assumed, though only at a late point in its progress, a tone of dignity; and its metre changed then from trochaic to iambic. The reason for their original use of the trochaic tetrameter was that their poetry was satyric and more

connected with dancing than it now is. As soon, however, as a spoken part came in, nature herself found the appropriate metre. The iambic, we know, is the most speakable of metres, as is shown by the fact that we very often fall into it in conversation, whereas we rarely talk hexameters, and only when we depart from the speaking tone of voice. (4) Another change was a plurality of episodes or acts. As for the remaining matters, the superadded embellishments and the account of their introduction, these must be taken as said, as it would probably be a long piece of work to go through the details.

5

As for Comedy, it is (as has been observed) an imitation of men worse than the average; worse, however, not as regards any and every sort of fault, but only as regards one particular kind, the Ridiculous, which is a species of the Ugly. The Ridiculous may be defined as a mistake or deformity not productive of pain or harm to others; the mask, for instance, that excites laughter, is something ugly and distorted without causing pain.

Though the successive changes in Tragedy and their authors are not unknown, we cannot say the same of Comedy; its early stages passed unnoticed, because it was not as yet taken up in a serious way. It was only at a late point in its progress that a chorus of comedians was officially granted by the archon; they used to be mere volunteers. It had also already certain definite forms at the time when the record of those termed comic poets begins. Who it was who supplied it with masks, or prologues, or a plurality of actors and the like, has remained unknown. The invented Fable, or Plot, however, originated in Sicily, with Epicharmus and Phormis; of Athenian poets Crates was the first to drop the Comedy of invective and frame stories of a general and non-personal nature, in other words, Fables or Plots.

Epic poetry, then, has been seen to agree with Tragedy to this extent, that of being an imitation of serious subjects in a grand kind of verse. It differs from it, however, (1) in that it is in one kind of verse and in narrative form; and (2) in its length--which is due to its action having no fixed limit of time, whereas Tragedy endeavours to keep as far as possible within a single circuit of the sun, or something near that. This, I say, is another point of difference between them, though at first the practice in this respect was just the same in tragedies as in epic poems. They differ also (3) in their constituents, some being common to both and others peculiar to Tragedy--hence a judge of good and bad in Tragedy is a judge of that in epic poetry also. All the parts of an epic are included in Tragedy; but those of Tragedy are not all of them to be found in the Epic.

6

Reserving hexameter poetry and Comedy for consideration hereafter, let us proceed now to the discussion of Tragedy; before doing so, however, we must gather up the definition resulting from what has been said. A tragedy, then, is the imitation of an action that is serious and also, as having magnitude, complete in itself; in language with pleasurable accessories, each kind brought in separately in the parts of the work; in a dramatic, not in a narrative form; with incidents arousing pity and fear, wherewith to accomplish its catharsis of such emotions. Here by 'language with pleasurable accessories' I mean that with rhythm and harmony or song superadded; and by 'the kinds separately' I mean that some portions are worked out with verse only, and others in turn with song.

I. As they act the stories, it follows that in the first place the Spectacle (or stage-appearance of the actors) must be some part of the whole; and in the second Melody and Diction, these two being the means of their imitation. Here by 'Diction' I mean merely this, the composition of the verses; and by 'Melody', what is too completely understood to require explanation. But further: the subject represented also is an action; and the action involves agents, who must necessarily have their distinctive qualities both of character and thought, since it is from these that we ascribe certain qualities to their actions. There are in the natural order of things, therefore, two causes, Character and Thought, of their actions, and consequently of their success or failure in their lives. Now the action (that which was done) is represented in the play by the Fable or Plot. The Fable, in our present sense of the term, is simply this, the combination of the incidents, or things done in the story; whereas Character is what makes us ascribe certain moral qualities to the agents; and Thought is shown in all they say when proving a particular point or, it may be, enunciating a general truth. There are six parts consequently of every tragedy, as a whole, that is, of such or such quality, viz. a Fable or Plot, Characters, Diction, Thought, Spectacle and Melody; two of them arising from the means, one from the manner, and three from the objects of the dramatic imitation; and there is nothing else besides these six. Of these, its formative elements, then, not a few of the dramatists have made due use, as every play, one may say, admits of Spectacle, Character, Fable, Diction, Melody, and Thought.

II. The most important of the six is the combination of the incidents of the story.

Tragedy is essentially an imitation not of persons but of action and life, of happiness and misery. All human happiness or misery takes the form of action; the end for which we live is a certain kind of activity, not a quality. Character gives us qualities, but it is in our actions--what we do--that we are happy or the reverse. In a play accordingly they do not act in order to portray the Characters; they include the Characters for the sake of the action. So that it is the action in it, i.e. its Fable or Plot, that is the end and purpose of the tragedy; and the end is everywhere the chief thing. Besides this, a tragedy is impossible without action, but there may be one without Character. The tragedies of most of the moderns are characterless--a defect common among poets of all kinds, and with its counterpart in painting in Zeuxis as compared with Polygnotus; for whereas the latter is strong in character, the work of Zeuxis is devoid of it. And again: one may string together a series of characteristic speeches of the utmost finish as regards Diction and Thought, and yet fail to produce the true tragic effect; but one will have much better success with a tragedy which, however inferior in these respects, has a Plot, a combination of incidents, in it. And again: the most powerful elements of attraction in Tragedy, the Peripeties and Discoveries, are parts of the Plot. A further proof is in the fact that beginners succeed earlier with the Diction and Characters than with the construction of a story; and the same may be said of nearly all the early dramatists. We maintain, therefore, that the first essential, the life and soul, so to speak, of Tragedy is the Plot; and that the Characters come second--compare the parallel in painting, where the most beautiful colours laid on without order will not give one the same pleasure as a simple black-and-white sketch of a portrait. We maintain that Tragedy is primarily an imitation of action, and that it is mainly for the sake of the action that it imitates the personal agents. Third comes the element of Thought, i.e. the power of saying whatever can be said, or what is appropriate to the occasion. This is what, in the speeches in Tragedy, falls under the arts of Politics and Rhetoric; for the older poets make their personages discourse like statesmen, and the moderns like rhetoricians. One must not confuse it with Character. Character in a play is that which reveals the moral purpose of the agents, i.e. the sort of thing they seek or avoid, where that is not obvious--hence there is no room for Character in a speech on a purely indifferent subject. Thought, on the other hand, is shown in all they say when proving or disproving some particular point, or enunciating some universal proposition. Fourth among the literary elements is the Diction of the personages, i.e. as before explained, the expression of their thoughts in words, which is practically the same thing with verse as with prose. As for the two remaining parts, the Melody is the greatest of the pleasurable accessories of Tragedy. The Spectacle, though an attraction, is the least artistic of all the parts, and has least to do with the art of poetry. The tragic effect is quite possible without a public performance and actors; and besides, the getting-up of the Spectacle is more a matter for the costumier than the poet.

7

Having thus distinguished the parts, let us now consider the proper construction of the Fable or Plot, as that is at once the first and the most important thing in Tragedy. We have laid it down that a tragedy is an imitation of an action that is complete in itself, as a whole of some magnitude; for a whole may be of no magnitude to speak of. Now a whole is that which has beginning, middle, and end. A beginning is that which is not itself necessarily after anything else, and which has naturally something else after it; an end is that which is naturally after something itself, either as its necessary or usual consequent, and with nothing else after it; and a middle, that which is by nature after one thing and has also another after it. A well-constructed Plot, therefore, cannot either begin or end at any point one likes; beginning and end in it must be of the forms just described. Again: to be beautiful, a living creature, and every whole made up of parts, must not only present a certain order in its arrangement of parts, but also be of a certain definite magnitude. Beauty is a matter of size and order, and therefore impossible either (1) in a very minute creature, since our perception becomes indistinct as it approaches instantaneity; or (2) in a creature of vast size--one, say, 1,000 miles long--as in that case, instead of the object being seen all at once, the unity and wholeness of it is lost to the beholder.

Just in the same way, then, as a beautiful whole made up of parts, or a beautiful living creature, must be of some size, a size to be taken in by the eye, so a story or Plot must be of some length, but of a length to be taken in by the memory. As for the limit of its length, so far as that is relative to public performances and spectators, it does not fall within the theory of poetry. If they had to perform a hundred tragedies, they would be timed by water-clocks, as they are said to have been at one period. The limit, however, set by the actual nature of the thing is this: the longer the story, consistently with its being comprehensible as a whole, the finer it is by reason of its magnitude. As a rough general formula, 'a length which allows of the hero passing by a series of probable or necessary stages from misfortune to happiness, or from happiness to misfortune', may suffice as a limit for the magnitude of the story.

8

The Unity of a Plot does not consist, as some suppose, in its having one man as its subject. An infinity of things befall that one man, some of which it is impossible to reduce to unity; and in like manner there are many actions of one man which cannot be made to form one action. One sees, therefore, the mistake of all the poets who have written a _Heracleid_, a _Theseid_, or similar poems; they suppose that, because Heracles was one man, the story also of Heracles must be one story. Homer, however, evidently understood this point quite well, whether by art or instinct, just in the same way as he excels the rest in every other respect. In writing an _Odyssey_, he did not make the poem cover all that ever befell his hero--it befell him, for instance, to get wounded on Parnassus and also to feign madness at the time of the call to arms, but the two incidents had no probable or necessary connexion with one another--instead of doing that, he took an action with a Unity of the kind we are describing as the subject of the _Odyssey_, as also of the _Iliad_. The truth is that, just as in the other imitative arts one imitation is always of one thing, so in poetry the story, as an imitation of action, must represent one action, a complete whole, with its several incidents so closely connected that the transposal or withdrawal of any one of them will disjoin and dislocate the whole. For that which makes no perceptible difference by its presence or absence is no real part of the whole.

9

From what we have said it will be seen that the poet's function is to describe, not the thing that has happened, but a kind of thing that might happen, i.e. what is possible as being probable or necessary. The distinction between historian and poet is not in the one writing prose and the other verse--you might put the work of Herodotus into verse, and it would still be a species of history; it consists really in this, that the one describes the thing that has been, and the other a kind of thing that might be. Hence poetry is something more philosophic and of graver import than history, since its statements are of the nature rather of universals, whereas those of history are singulars. By a universal statement I mean one as to what such or such a kind of man will probably or necessarily say or do--which is the aim of poetry, though it affixes proper names to the characters; by a singular statement, one as to what, say, Alcibiades did or had done to him. In Comedy this has become clear by this time; it is only when their plot is already made up of probable incidents that they give it a basis of proper names, choosing for the purpose any names that may occur to them, instead of writing like the old iambic poets about particular persons. In Tragedy, however, they still adhere to the historic names; and for this reason: what convinces is the possible; now whereas we are not yet sure as to the possibility of that which has not happened, that which has happened is manifestly possible, else it would not have come to pass. Nevertheless even in Tragedy there are some plays with but one or two known names in them, the rest being inventions; and there are some without a single known name, e.g. Agathon's Anthens, in which both incidents and names are of the poet's invention; and it is no less delightful on that account. So that one must not aim at a rigid adherence to the traditional stories on which tragedies are based. It would be absurd, in fact, to do so, as even the known stories are only known to a few, though they are a delight none the less to all.

It is evident from the above that, the poet must be more the poet of his stories or Plots than of his verses, inasmuch as he is a poet by virtue of the imitative element in his work, and it is actions that he imitates. And if he should come to take a subject from actual history, he is none the less a poet for that; since some historic occurrences may very well be in the probable and possible order of things; and it is in that aspect of them that he is their poet.

Of simple Plots and actions the episodic are the worst. I call a Plot episodic when there is neither probability nor necessity in the sequence of episodes. Actions of this sort bad poets construct through their own fault, and good ones on account of the players. His work being for public performance, a good poet often stretches out a Plot beyond its capabilities, and is thus obliged to twist the sequence of incident.

Tragedy, however, is an imitation not only of a complete action, but also of incidents arousing pity and fear. Such incidents have the very greatest effect on the mind when they occur unexpectedly and at the same time in consequence of one another; there is more of the marvellous in them then than if they happened of themselves or by mere chance. Even matters of chance seem most marvellous if there is an appearance of design as it were in them; as for instance the statue of Mitys at Argos killed the author of Mitys' death by falling down on him when a looker-on at a public spectacle; for incidents like that we think to be not without a meaning. A Plot, therefore, of this sort is necessarily finer than others.

10

Plots are either simple or complex, since the actions they represent are naturally of this twofold description. The action, proceeding in the way defined, as one continuous whole, I call simple, when the change in the hero's fortunes takes place without Peripety or

Discovery; and complex, when it involves one or the other, or both. These should each of them arise out of the structure of the Plot itself, so as to be the consequence, necessary or probable, of the antecedents. There is a great difference between a thing happening _propter hoc_ and _post hoc_.

11

A Peripety is the change from one state of things within the play to its opposite of the kind described, and that too in the way we are saying, in the probable or necessary sequence of events; as it is for instance in _Oedipus_: here the opposite state of things is produced by the Messenger, who, coming to gladden Oedipus and to remove his fears as to his mother, reveals the secret of his birth. And in _Lynceus_: just as he is being led off for execution, with Danaus at his side to put him to death, the incidents preceding this bring it about that he is saved and Danaus put to death. A Discovery is, as the very word implies, a change from ignorance to knowledge, and thus to either love or hate, in the personages marked for good or evil fortune. The finest form of Discovery is one attended by Peripeties, like that which goes with the Discovery in _Oedipus_. There are no doubt other forms of it; what we have said may happen in a way in reference to inanimate things, even things of a very casual kind; and it is also possible to discover whether some one has done or not done something. But the form most directly connected with the Plot and the action of the piece is the first-mentioned. This, with a Peripety, will arouse either pity or fear--actions of that nature being what Tragedy is assumed to represent; and it will also serve to bring about the happy or unhappy ending. The Discovery, then, being of persons, it may be that of one party only to the other, the latter being already known; or both the parties may have to discover themselves. Iphigenia, for instance, was discovered to Orestes by sending the letter; and another Discovery was required to reveal him to Iphigenia.

Two parts of the Plot, then, Peripety and Discovery, are on matters of this sort. A third part is Suffering; which we may define as an action of a destructive or painful nature, such as murders on the stage, tortures, woundings, and the like. The other two have been already explained.

12

The parts of Tragedy to be treated as formative elements in the whole were mentioned in a previous Chapter. From the point of view, however, of its quantity, i.e. the separate sections into which it is divided, a tragedy has the following parts: Prologue, Episode, Exode, and a choral portion, distinguished into Parode and Stasimon; these two are common to all tragedies, whereas songs from the stage and Commoe are only found in some. The Prologue is all that precedes the Parode of the chorus; an Episode all that comes in between two whole choral songs; the Exode all that follows after the last choral song. In the choral portion the Parode is the whole first statement of the chorus; a Stasimon, a song of the chorus without anapaests or trochees; a Commas, a lamentation sung by chorus and actor in concert. The parts of Tragedy to be used as formative elements in the whole we have already mentioned; the above are its parts from the point of view of its quantity, or the separate sections into which it is divided.

13

The next points after what we have said above will be these: (1) What is the poet to aim at, and what is he to avoid, in constructing his Plots? and (2) What are the conditions on which the tragic effect depends?

We assume that, for the finest form of Tragedy, the Plot must be not simple but complex; and further, that it must imitate actions arousing pity and fear, since that is the distinctive function of this kind of imitation. It follows, therefore, that there are three forms of Plot to be avoided. (1) A good man must not be seen passing from happiness to misery, or (2) a bad man from misery to happiness.

The first situation is not fear-inspiring or piteous, but simply odious to us. The second is the most untragic that can be; it has no one of the requisites of Tragedy; it does not appeal either to the human feeling in us, or to our pity, or to our fears. Nor, on the other hand, should (3) an extremely bad man be seen falling from happiness into misery. Such a story may arouse the human feeling in us, but it will not move us to either pity or fear; pity is occasioned by undeserved misfortune, and fear by that of one like ourselves; so that there will be nothing either piteous or fear-inspiring in the situation. There remains, then, the intermediate kind of personage, a man not pre-eminently virtuous and just, whose misfortune, however, is brought upon him not by vice and depravity but by some error of judgement, of the number of those in the enjoyment of great reputation and prosperity; e.g. Oedipus, Thyestes, and the

men of note of similar families. The perfect Plot, accordingly, must have a single, and not (as some tell us) a double issue; the change in the hero's fortunes must be not from misery to happiness, but on the contrary from happiness to misery; and the cause of it must lie not in any depravity, but in some great error on his part; the man himself being either such as we have described, or better, not worse, than that. Fact also confirms our theory. Though the poets began by accepting any tragic story that came to hand, in these days the finest tragedies are always on the story of some few houses, on that of Alemeon, Oedipus, Orestes, Meleager, Thyestes, Telephus, or any others that may have been involved, as either agents or sufferers, in some deed of horror. The theoretically best tragedy, then, has a Plot of this description. The critics, therefore, are wrong who blame Euripides for taking this line in his tragedies, and giving many of them an unhappy ending. It is, as we have said, the right line to take. The best proof is this: on the stage, and in the public performances, such plays, properly worked out, are seen to be the most truly tragic; and Euripides, even if his elecution be faulty in every other point, is seen to be nevertheless the most tragic certainly of the dramatists. After this comes the construction of Plot which some rank first, one with a double story (like the _Odyssey_) and an opposite issue for the good and the bad personages. It is ranked as first only through the weakness of the audiences; the poets merely follow their public, writing as its wishes dictate. But the pleasure here is not that of Tragedy. It belongs rather to Comedy, where the bitterest enemies in the piece (e.g. Orestes and Aegisthus) walk off good friends at the end, with no slaying of any one by any one.

14

The tragic fear and pity may be aroused by the Spectacle; but they may also be aroused by the very structure and incidents of the play--which is the better way and shows the better poet. The Plot in fact should be so framed that, even without seeing the things take place, he who simply hears the account of them shall be filled with horror and pity at the incidents; which is just the effect that the mere recital of the story in _Oedipus_ would have on one. To produce this same effect by means of the Spectacle is less artistic, and requires extraneous aid. Those, however, who make use of the Spectacle to put before us that which is merely monstrous and not productive of fear, are wholly out of touch with Tragedy; not every kind of pleasure should be required of a tragedy, but only its own proper pleasure.

The tragic pleasure is that of pity and fear, and the poet has to produce it by a work of imitation; it is clear, therefore, that the causes should be included in the incidents of his story. Let us see, then, what kinds of incident strike one as horrible, or rather as piteous. In a deed of this description the parties must necessarily be either friends, or enemies, or indifferent to one another. Now when enemy does it on enemy, there is nothing to move us to pity either in his doing or in his meditating the deed, except so far as the actual pain of the sufferer is concerned; and the same is true when the parties are indifferent to one another. Whenever the tragic deed, however, is done within the family--when murder or the like is done or meditated by brother on brother, by son on father, by mother on son, or son on mother--these are the situations the poet should seek after. The traditional stories, accordingly, must be kept as they are, e.g. the murder of Clytaemnestra by Orestes and of Eriphyle by Alcmeon. At the same time even with these there is something left to the poet himself; it is for him to devise the right way of treating them. Let us explain more clearly what we mean by 'the right way'. The deed of horror may be done by the doer knowingly and consciously, as in the old poets, and in Medea's murder of her children in Euripides. Or he may do it, but in ignorance of his relationship, and discover that afterwards, as does the _Oedipus_ in Sophocles. Here the deed is outside the play; but it may be within it, like the act of the Alcmeon in Astydamas, or that of the Telegonus in _Ulysses Wounded_. A third possibility is for one meditating some deadly injury to another, in ignorance of his relationship, to make the discovery in time to draw back. These exhaust the possibilities, since the deed must necessarily be either done or not done, and either knowingly or unknowingly.

The worst situation is when the personage is with full knowledge on the point of doing the deed, and leaves it undone. It is odious and also (through the absence of suffering) untragic; hence it is that no one is made to act thus except in some few instances, e.g. Haemon and Creon in _Antigone_. Next after this comes the actual perpetration of the deed meditated. A better situation than that, however, is for the deed to be done in ignorance, and the relationship discovered afterwards, since there is nothing odious in it, and the Discovery will serve to astound us. But the best of all is the last; what we have in _Cresphontes_, for example, where Merope, on the point of slaying her son, recognizes him in time; in _Iphigenia_, where sister and brother are in a like position; and in _Helle_, where the son recognizes his mother, when on the point of giving her up to her enemy.

This will explain why our tragedies are restricted (as we said just now) to such a small number of families. It was accident rather than art that led the poets in quest of subjects to embody this kind of incident in their Plots. They are still obliged, accordingly, to have recourse to the families in which such horrors have occurred.

On the construction of the Plot, and the kind of Plot required for Tragedy, enough has now been said.

15

In the Characters there are four points to aim at. First and foremost, that they shall be good. There will be an element of character in the play, if (as has been observed) what a personage says or does reveals a certain moral purpose; and a good element of character, if the purpose so revealed is good. Such goodness is possible in every type of personage, even in a woman or a slave, though the one is perhaps an inferior, and the other a wholly worthless being. The second point is to make them appropriate. The Character before us may be, say, manly; but it is not appropriate in a female Character to be manly, or clever. The third is to make them like the reality, which is not the same as their being good and appropriate, in our sense of the term. The fourth is to make them consistent and the same throughout; even if inconsistency be part of the man before one for imitation as presenting that form of character, he should still be consistently inconsistent. We have an instance of baseness of character, not required for the story, in the Menelaus in _Orestes_; of the incongruous and unbefitting in the lamentation of Ulysses in _Scylla_, and in the (clever) speech of Melanippe; and of inconsistency in _Iphigenia at Aulis_, where Iphigenia the suppliant is utterly unlike the later Iphigenia. The right thing, however, is in the Characters just as in the incidents of the play to endeavour always after the necessary or the probable; so that whenever such-and-such a personage says or does such-and-such a thing, it shall be the probable or necessary outcome of his character; and whenever this incident follows on that, it shall be either the necessary or the probable consequence of it. From this one sees (to digress for a moment) that the Denouement also should arise out of the plot itself, arid not depend on a stage-artifice, as in _Medea_, or in the story of the (arrested) departure of the Greeks in the _Iliad_. The artifice must be reserved for matters outside the play--for past events beyond human knowledge, or events yet to come, which require to be foretold or announced; since it is the privilege of the Gods to know everything. There should be nothing improbable among the actual incidents. If it be unavoidable, however, it should be outside the tragedy, like the improbability in the _Oedipus_ of Sophocles. But to return to the Characters. As Tragedy is an imitation of personages better than the ordinary man, we in our way should follow the example of good portrait-painters, who reproduce the distinctive features of a man, and at the same time, without losing the likeness, make him handsomer than he is. The poet in like manner, in portraying men quick or slow to anger, or with similar infirmities of character, must know how to represent them as such, and at the same time as good men, as Agathon and Homer have represented Achilles.

All these rules one must keep in mind throughout, and further, those also for such points of stage-effect as directly depend on the art of the poet, since in these too one may often make mistakes. Enough, however, has been said on the subject in one of our published writings.

16

Discovery in general has been explained already. As for the species of Discovery, the first to be noted is (1) the least artistic form of it, of which the poets make most use through mere lack of invention, Discovery by signs or marks. Of these signs some are congenital, like the 'lance-head which the Earth-born have on them', or 'stars', such as Carcinus brings in in his _Thyestes_; others acquired after birth--these latter being either marks on the body, e.g. scars, or external tokens, like necklaces, or to take another sort of instance, the ark in the Discovery in _Tyro_. Even these, however, admit of two uses, a better and a worse; the scar of Ulysses is an instance; the Discovery of him through it is made in one way by the nurse and in another by the swineherds. A Discovery using signs as a means of assurance is less artistic, as indeed are all such as imply reflection; whereas one bringing them in all of a sudden, as in the _Bath-story_, is of a better order. Next after these are (2) Discoveries made directly by the poet; which are inartistic for that very reason; e.g. Orestes' Discovery of himself in _Iphigenia_: whereas his sister reveals who she is by the letter, Orestes is made to say himself what the poet rather than the story demands. This, therefore, is not far removed from the first-mentioned fault, since he might have presented certain tokens as well. Another instance is the 'shuttle's voice' in the _Tereus_ of Sophocles. (3) A third species is Discovery through memory, from a man's consciousness being awakened by something seen or heard. Thus in _The Cyprioe_ of Dicaeogenes, the sight of the picture makes the man burst into tears; and in the _Tale of Alcinous_, hearing the harper Ulysses is reminded of the past and weeps; the Discovery of them being the result. (4) A fourth kind is Discovery through reasoning; e.g. in _The Choephoroe_: 'One like me is here; there is no one like me but Orestes; he, therefore, must be here.' Or that which Polyidus the Sophist suggested for _Iphigenia_; since it was natural for Orestes to reflect: 'My sister was sacrificed, and I am to be sacrificed like her.' Or that in the _Tydeus_ of Theodectes: 'I came to find a son, and am to die myself.' Or that in _The Phinidae_: on seeing the place the women inferred their fate, that they were to die there, since they had

also been exposed there. (5) There is, too, a composite Discovery arising from bad reasoning on the side of the other party. An instance of it is in _Ulysses the False Messenger_: he said he should know the bow--which he had not seen; but to suppose from that that he would know it again (as though he had once seen it) was bad reasoning. (6) The best of all Discoveries, however, is that arising from the incidents themselves, when the great surprise comes about through a probable incident, like that in the _Oedipus_ of Sophocles; and also in _Iphigenia_; for it was not improbable that she should wish to have a letter taken home. These last are the only Discoveries independent of the artifice of signs and necklaces. Next after them come Discoveries through reasoning.

17

At the time when he is constructing his Plots, and engaged on the Diction in which they are worked out, the poet should remember (1) to put the actual scenes as far as possible before his eyes. In this way, seeing everything with the vividness of an eye-witness as it were, he will devise what is appropriate, and be least likely to overlook incongruities. This is shown by what was censured in Carcinus, the return of Amphiaraus from the sanctuary; it would have passed unnoticed, if it had not been actually seen by the audience; but on the stage his play failed, the incongruity of the incident offending the spectators. (2) As far as may be, too, the poet should even act his story with the very gestures of his personages. Given the same natural qualifications, he who feels the emotions to be described will be the most convincing; distress and anger, for instance, are portrayed most truthfully by one who is feeling them at the moment. Hence it is that poetry demands a man with special gift for it, or else one with a touch of madness in him; the former can easily assume the required mood, and the latter may be actually beside himself with emotion. (3) His story, again, whether already made or of his own making, he should first simplify and reduce to a universal form, before proceeding to lengthen it out by the insertion of episodes. The following will show how the universal element in _Iphigenia_, for instance, may be viewed: A certain maiden having been offered in sacrifice, and spirited away from her sacrificers into another land, where the custom was to sacrifice all strangers to the Goddess, she was made there the priestess of this rite. Long after that the brother of the priestess happened to come; the fact, however, of the oracle having for a certain reason bidden him go thither, and his object in going, are outside the Plot of the play. On his coming he was arrested, and about to be sacrificed, when he revealed who he was--either as Euripides puts it, or (as suggested by Polyidus) by the not improbable exclamation, 'So I too am doomed to be sacrificed, as my sister was'; and the disclosure led to his salvation. This done, the next thing, after the proper names have been fixed as a basis for the story, is to work in episodes or accessory incidents. One must mind, however, that the episodes are appropriate, like the fit of madness in Orestes, which led to his arrest, and the purifying, which brought about his salvation. In plays, then, the episodes are short; in epic poetry they serve to lengthen out the poem. The argument of the _Odyssey_ is not a long one.

A certain man has been abroad many years; Poseidon is ever on the watch for him, and he is all alone. Matters at home too have come to this, that his substance is being wasted and his son's death plotted by suitors to his wife. Then he arrives there himself after his grievous sufferings; reveals himself, and falls on his enemies; and the end is his salvation and their death. This being all that is proper to the _Odyssey_, everything else in it is episode.

18

(4) There is a further point to be borne in mind. Every tragedy is in part Complication and in part Denouement; the incidents before the opening scene, and often certain also of those within the play, forming the Complication; and the rest the Denouement. By Complication I mean all from the beginning of the story to the point just before the change in the hero's fortunes; by Denouement, all from the beginning of the change to the end. In the _Lynceus_ of Theodectes, for instance, the Complication includes, together with the presupposed incidents, the seizure of the child and that in turn of the parents; and the Denouement all from the indictment for the murder to the end. Now it is right, when one speaks of a tragedy as the same or not the same as another, to do so on the ground before all else of their Plot, i.e. as having the same or not the same Complication and Denouement. Yet there are many dramatists who, after a good Complication, fail in the Denouement. But it is necessary for both points of construction to be always duly mastered. (5) There are four distinct species of Tragedy--that being the number of the constituents also that have been mentioned: first, the complex Tragedy, which is all Peripety and Discovery; second, the Tragedy of suffering, e.g. the _Ajaxes_ and _Ixions_; third, the Tragedy of character, e.g. _The Phthiotides_ and _Peleus_. The fourth constituent is that of 'Spectacle', exemplified in _The Phorcides_, in _Prometheus_, and in all plays with the scene laid in the nether world. The poet's aim, then, should be to combine every element of interest, if possible, or else the more important and the major part of them. This is now especially necessary owing to the unfair criticism to which the poet is subjected in these days. Just because there have been poets

before him strong in the several species of tragedy, the critics now expect the one man to surpass that which was the strong point of each one of his predecessors. (6) One should also remember what has been said more than once, and not write a tragedy on an epic body of incident (i.e. one with a plurality of stories in it), by attempting to dramatize, for instance, the entire story of the _Iliad_. In the epic owing to its scale every part is treated at proper length; with a drama, however, on the same story the result is very disappointing. This is shown by the fact that all who have dramatized the fall of Ilium in its entirety, and not part by part, like Euripides, or the whole of the Niobe story, instead of a portion, like Aeschylus, either fail utterly or have but ill success on the stage; for that and that alone was enough to ruin a play by Agathon. Yet in their Peripeties, as also in their simple plots, the poets I mean show wonderful skill in aiming at the kind of effect they desire--a tragic situation that arouses the human feeling in one, like the clever villain (e.g. Sisyphus) deceived, or the brave wrongdoer worsted. This is probable, however, only in Agathon's sense, when he speaks of the probability of even improbabilities coming to pass. (7) The Chorus too should be regarded as one of the actors; it should be an integral part of the whole, and take a share in the action--that which it has in Sophocles rather than in Euripides. With the later poets, however, the songs in a play of theirs have no more to do with the Plot of that than of any other tragedy. Hence it is that they are now singing intercalary pieces, a practice first introduced by Agathon. And yet what real difference is there between singing such intercalary pieces, and attempting to fit in a speech, or even a whole act, from one play into another?

19

The Plot and Characters having been discussed, it remains to consider the Diction and Thought. As for the Thought, we may assume what is said of it in our Art of Rhetoric, as it belongs more properly to that department of inquiry. The Thought of the personages is shown in everything to be effected by their language--in every effort to prove or disprove, to arouse emotion (pity, fear, anger, and the like), or to maximize or minimize things. It is clear, also, that their mental procedure must be on the same lines in their actions likewise, whenever they wish them to arouse pity or horror, or have a look of importance or probability. The only difference is that with the act the impression has to be made without explanation; whereas with the spoken word it has to be produced by the speaker, and result from his language. What, indeed, would be the good of the speaker, if things appeared in the required light even apart from anything he says?

As regards the Diction, one subject for inquiry under this head is the turns given to the language when spoken; e.g. the difference between command and prayer, simple statement and threat, question and answer, and so forth. The theory of such matters, however, belongs to Elocution and the professors of that art. Whether the poet knows these things or not, his art as a poet is never seriously criticized on that account. What fault can one see in Homer's 'Sing of the wrath, Goddess'?--which Protagoras has criticized as being a command where a prayer was meant, since to bid one do or not do, he tells us, is a command. Let us pass over this, then, as appertaining to another art, and not to that of poetry.

20

The Diction viewed as a whole is made up of the following parts: the Letter (or ultimate element), the Syllable, the Conjunction, the Article, the Noun, the Verb, the Case, and the Speech. (1) The Letter is an indivisible sound of a particular kind, one that may become a factor in an intelligible sound. Indivisible sounds are uttered by the brutes also, but no one of these is a Letter in our sense of the term. These elementary sounds are either vowels, semivowels, or mutes. A vowel is a Letter having an audible sound without the addition of another Letter. A semivowel, one having an audible sound by the addition of another Letter; e.g. S and R. A mute, one having no sound at all by itself, but becoming audible by an addition, that of one of the Letters which have a sound of some sort of their own; e.g. D and G. The Letters differ in various ways: as produced by different conformations or in different regions of the mouth; as aspirated, not aspirated, or sometimes one and sometimes the other; as long, short, or of variable quantity; and further as having an acute grave, or intermediate accent.

The details of these matters we must leave to the metricians. (2) A Syllable is a nonsignificant composite sound, made up of a mute and a Letter having a sound (a vowel or semivowel); for GR, without an A, is just as much a Syllable as GRA, with an A. The various forms of the Syllable also belong to the theory of metre. (3) A Conjunction is (a) a non-significant sound which, when one significant sound is formable out of several, neither hinders nor aids the union, and which, if the Speech thus formed stands by itself (apart from other Speeches) must not be inserted at the beginning of it; e.g. _men_, _de_, _toi_, _de_. Or (b) a non-significant sound capable of combining two or more significant sounds into one; e.g. _amphi_, _peri_, etc. (4) An Article is a non-significant sound marking the beginning, end, or dividing-point of a Speech, its natural place being either at the extremities or in the middle. (5) A Noun or name is a composite significant sound not involving the idea of time, with parts which have no significance by

themselves in it. It is to be remembered that in a compound we do not think of the parts as having a significance also by themselves; in the name 'Theodorus', for instance, the _doron_ means nothing to us.

(6) A Verb is a composite significant sound involving the idea of time, with parts which (just as in the Noun) have no significance by themselves in it. Whereas the word 'man' or 'white' does not imply _when_, 'walks' and 'has walked' involve in addition to the idea of walking that of time present or time past.

(7) A Case of a Noun or Verb is when the word means 'of or 'to' a thing, and so forth, or for one or many (e.g. 'man' and 'men'); or it may consist merely in the mode of utterance, e.g. in question, command, etc. 'Walked?' and 'Walk!' are Cases of the verb 'to walk' of this last kind. (8) A Speech is a composite significant sound, some of the parts of which have a certain significance by themselves. It may be observed that a Speech is not always made up of Noun and Verb; it may be without a Verb, like the definition of man; but it will always have some part with a certain significance by itself. In the Speech 'Cleon walks', 'Cleon' is an instance of such a part. A Speech is said to be one in two ways, either as signifying one thing, or as a union of several Speeches made into one by conjunction. Thus the _Iliad_ is one Speech by conjunction of several; and the definition of man is one through its signifying one thing.

21

Nouns are of two kinds, either (1) simple, i.e. made up of non-significant parts, like the word ge, or (2) double; in the latter case the word may be made up either of a significant and a non-significant part (a distinction which disappears in the compound), or of two significant parts. It is possible also to have triple, quadruple or higher compounds, like most of our amplified names; e.g.' Hermocaicoxanthus' and the like.

Whatever its structure, a Noun must always be either (1) the ordinary word for the thing, or (2) a strange word, or (3) a metaphor, or (4) an ornamental word, or (5) a coined word, or (6) a word lengthened out, or (7) curtailed, or (8) altered in form. By the ordinary word I mean that in general use in a country; and by a strange word, one in use elsewhere. So that the same word may obviously be at once strange and ordinary, though not in reference to the same people; _sigunos_, for instance, is an ordinary word in Cyprus, and a strange word with us. Metaphor consists in giving the thing a name that belongs to something else; the transference being either from genus to species, or from species to genus, or from species to species, or on grounds of analogy. That from genus to species is eXemplified in 'Here stands my ship'; for lying at anchor is the 'standing' of a particular kind of thing. That from species to genus in 'Truly ten thousand good deeds has Ulysses wrought', where 'ten thousand', which is a particular large number, is put in place of the generic 'a large number'. That from species to species in 'Drawing the life with the bronze', and in 'Severing with the enduring bronze'; where the poet uses 'draw' in the sense of 'sever' and 'sever' in that of 'draw', both words meaning to 'take away' something. That from analogy is possible whenever there are four terms so related that the second (B) is to the first (A), as the fourth (D) to the third (C); for one may then metaphorically put B in lieu of D, and D in lieu of B. Now and then, too, they qualify the metaphor by adding on to it that to which the word it supplants is relative. Thus a cup (B) is in relation to Dionysus (A) what a shield (D) is to Ares (C). The cup accordingly will be metaphorically described as the 'shield _of Dionysus_' (D + A), and the shield as the 'cup _of Ares_' (B + C). Or to take another instance: As old age (D) is to life (C), so is evening (B) to day (A). One will accordingly describe evening (B) as the 'old age _of the day_' (D + A)--or by the Empedoclean equivalent; and old age (D) as the 'evening' or 'sunset of life'' (B + C). It may be that some of the terms thus related have no special name of their own, but for all that they will be metaphorically described in just the same way. Thus to cast forth seed-corn is called 'sowing'; but to cast forth its flame, as said of the sun, has no special name. This nameless act (B), however, stands in just the same relation to its object, sunlight (A), as sowing (D) to the seed-corn (C). Hence the expression in the poet, 'sowing around a god-created _flame_' (D + A). There is also another form of qualified metaphor. Having given the thing the alien name, one may by a negative addition deny of it one of the attributes naturally associated with its new name. An instance of this would be to call the shield not the 'cup _of Ares_,' as in the former case, but a 'cup _that holds no wine_'. * * * A coined word is a name which, being quite unknown among a people, is given by the poet himself; e.g. (for there are some words that seem to be of this origin) _hernyges_ for horns, and _areter_ for priest. A word is said to be lengthened out, when it has a short vowel made long, or an extra syllable inserted; e. g. _polleos_ for _poleos_, _Peleiadeo_ for _Peleidon_. It is said to be curtailed, when it has lost a part; e.g. _kri_, _do_, and _ops_ in _mia ginetai amphoteron ops_. It is an altered word, when part is left as it was and part is of the poet's making; e.g. _dexiteron_ for _dexion_, in _dexiteron kata maxon_.

The Nouns themselves (to whatever class they may belong) are either masculines, feminines, or intermediates (neuter). All ending in N, P, S, or in the two compounds of this last, PS and X, are masculines. All ending in the invariably long vowels, H and O, and in A among the vowels that may be long, are feminines. So that there is an equal number of masculine and feminine terminations, as PS and X are the same as S, and need not be counted. There is no Noun, however, ending in a mute or in either of the two short vowels, E and O. Only three (_meli, kommi, peperi_) end in I, and five in T. The intermediates, or neuters, end in the variable vowels or in N, P, X.

22

The perfection of Diction is for it to be at once clear and not mean. The clearest indeed is that made up of the ordinary words for things, but it is mean, as is shown by the poetry of Cleophon and Sthenelus. On the other hand the Diction becomes distinguished and non-prosaic by the use of unfamiliar terms, i.e. strange words, metaphors, lengthened forms, and everything that deviates from the ordinary modes of speech.--But a whole statement in such terms will be either a riddle or a barbarism, a riddle, if made up of metaphors, a barbarism, if made up of strange words. The very nature indeed of a riddle is this, to describe a fact in an impossible combination of words (which cannot be done with the real names for things, but can be with their metaphorical substitutes); e.g. 'I saw a man glue brass on another with fire', and the like. The corresponding use of strange words results in a barbarism.--A certain admixture, accordingly, of unfamiliar terms is necessary. These, the strange word, the metaphor, the ornamental equivalent, etc.. will save the language from seeming mean and prosaic, while the ordinary words in it will secure the requisite clearness. What helps most, however, to render the Diction at once clear and non-prosaic is the use of the lengthened, curtailed, and altered forms of words. Their deviation from the ordinary words will, by making the language unlike that in general use give it a non-prosaic appearance; and their having much in common with the words in general use will give it the quality of clearness. It is not right, then, to condemn these modes of speech, and ridicule the poet for using them, as some have done; e.g. the elder Euclid, who said it was easy to make poetry if one were to be allowed to lengthen the words in the statement itself as much as one likes--a procedure he caricatured by reading '_Epixarhon eidon Marathonade Badi--gonta_, and _ouk han g' eramenos ton ekeinou helle boron_ as verses. A too apparent use of these licences has certainly a ludicrous effect, but they are not alone in that; the rule of moderation applies to all the constituents of the poetic vocabulary; even with metaphors, strange words, and the rest, the effect will be the same, if one uses them improperly and with a view to provoking laughter. The proper use of them is a very different thing. To realize the difference one should take an epic verse and see how it reads when the normal words are introduced. The same should be done too with the strange word, the metaphor, and the rest; for one has only to put the ordinary words in their place to see the truth of what we are saying. The same iambic, for instance, is found in Aeschylus and Euripides, and as it stands in the former it is a poor line; whereas Euripides, by the change of a single word, the substitution of a strange for what is by usage the ordinary word, has made it seem a fine one. Aeschylus having said in his _Philoctetes_:

phagedaina he mon sarkas hesthiei podos

Euripides has merely altered the hesthiei here into thoinatai. Or suppose

nun de m' heon holigos te kai outidanos kai haeikos

to be altered by the substitution of the ordinary words into

nun de m' heon mikros te kai hasthenikos kai haeidos

Or the line

diphron haeikelion katatheis olingen te trapexan

into

diphron moxtheron katatheis mikran te trapexan

Or heiones boosin into heiones kraxousin. Add to this that Ariphrades used to ridicule the tragedians for introducing expressions unknown in the language of common life, _doeaton hapo_ (for _apo domaton_), _sethen_, _hego de nin_, _Achilleos peri_ (for _peri Achilleos_), and the like. The mere fact of their not being in ordinary speech gives the Diction a non-prosaic character; but Ariphrades was unaware of that. It is a great thing, indeed, to make a proper use of these poetical forms, as also of compounds and strange words. But the greatest thing by far is to be a master of metaphor. It is the one thing that cannot be learnt from others; and

it is also a sign of genius, since a good metaphor implies an intuitive perception of the similarity in dissimilars.

Of the kinds of words we have enumerated it may be observed that compounds are most in place in the dithyramb, strange words in heroic, and metaphors in iambic poetry. Heroic poetry, indeed, may avail itself of them all. But in iambic verse, which models itself as far as possible on the spoken language, only those kinds of words are in place which are allowable also in an oration, i.e. the ordinary word, the metaphor, and the ornamental equivalent.

Let this, then, suffice as an account of Tragedy, the art imitating by means of action on the stage.

23

As for the poetry which merely narrates, or imitates by means of versified language (without action), it is evident that it has several points in common with Tragedy.

I. The construction of its stories should clearly be like that in a drama; they should be based on a single action, one that is a complete whole in itself, with a beginning, middle, and end, so as to enable the work to produce its own proper pleasure with all the organic unity of a living creature. Nor should one suppose that there is anything like them in our usual histories. A history has to deal not with one action, but with one period and all that happened in that to one or more persons, however disconnected the several events may have been. Just as two events may take place at the same time, e.g. the sea-fight off Salamis and the battle with the Carthaginians in Sicily, without converging to the same end, so too of two consecutive events one may sometimes come after the other with no one end as their common issue. Nevertheless most of our epic poets, one may say, ignore the distinction.

Herein, then, to repeat what we have said before, we have a further proof of Homer's marvellous superiority to the rest. He did not attempt to deal even with the Trojan war in its entirety, though it was a whole with a definite beginning and end--through a feeling apparently that it was too long a story to be taken in in one view, or if not that, too complicated from the variety of incident in it. As it is, he has singled out one section of the whole; many of the other incidents, however, he brings in as episodes, using the Catalogue of the Ships, for instance, and other episodes to relieve the uniformity of his narrative. As for the other epic poets, they treat of one man, or one period; or else of an action which, although one, has a multiplicity of parts in it. This last is what the authors of the _Cypria_ and _Little_ _Iliad_ have done. And the result is that, whereas the _Iliad_ or _Odyssey_ supplies materials for only one, or at most two tragedies, the _Cypria_ does that for several, and the _Little_ _Iliad_ for more than eight: for an _Adjudgment of Arms_, a _Philoctetes_, a _Neoptolemus_, a _Eurypylus_, a _Ulysses as Beggar_, a _Laconian Women_, a _Fall of Ilium_, and a _Departure of the Fleet_; as also a _Sinon_, and _Women of Troy_.

24

II. Besides this, Epic poetry must divide into the same species as Tragedy; it must be either simple or complex, a story of character or one of suffering. Its parts, too, with the exception of Song and Spectacle, must be the same, as it requires Peripeties, Discoveries, and scenes of suffering just like Tragedy. Lastly, the Thought and Diction in it must be good in their way. All these elements appear in Homer first; and he has made due use of them. His two poems are each examples of construction, the _Iliad_ simple and a story of suffering, the _Odyssey_ complex (there is Discovery throughout it) and a story of character. And they are more than this, since in Diction and Thought too they surpass all other poems.

There is, however, a difference in the Epic as compared with Tragedy, (1) in its length, and (2) in its metre. (1) As to its length, the limit already suggested will suffice: it must be possible for the beginning and end of the work to be taken in in one view--a condition which will be fulfilled if the poem be shorter than the old epics, and about as long as the series of tragedies offered for one hearing. For the extension of its length epic poetry has a special advantage, of which it makes large use. In a play one cannot represent an action with a number of parts going on simultaneously; one is limited to the part on the stage and connected with the actors. Whereas in epic poetry the narrative form makes it possible for one to describe a number of simultaneous incidents; and these, if germane to the subject, increase the body of the poem. This then is a gain to the Epic, tending to give it grandeur, and also variety of interest and room for episodes of diverse kinds. Uniformity of incident by the satiety it soon creates is apt to ruin tragedies on the stage. (2) As for its metre, the heroic has been assigned it from experience; were any one to attempt a narrative poem in some one, or in several, of the other metres, the incongruity of the thing would be apparent. The heroic; in fact is the gravest and weightiest of metres--which is what makes it more tolerant than the rest of strange words and metaphors, that also being a point in which the narrative form of poetry goes beyond all others. The iambic and trochaic, on the other hand, are metres of movement, the one

representing that of life and action, the other that of the dance. Still more unnatural would it appear, it one were to write an epic in a medley of metres, as Chaeremon did. Hence it is that no one has ever written a long story in any but heroic verse; nature herself, as we have said, teaches us to select the metre appropriate to such a story.

Homer, admirable as he is in every other respect, is especially so in this, that he alone among epic poets is not unaware of the part to be played by the poet himself in the poem. The poet should say very little in propria persona, as he is no imitator when doing that. Whereas the other poets are perpetually coming forward in person, and say but little, and that only here and there, as imitators, Homer after a brief preface brings in forthwith a man, a woman, or some other Character--no one of them characterless, but each with distinctive characteristics.

The marvellous is certainly required in Tragedy. The Epic, however, affords more opening for the improbable, the chief factor in the marvellous, because in it the agents are not visibly before one. The scene of the pursuit of Hector would be ridiculous on the stage--the Greeks halting instead of pursuing him, and Achilles shaking his head to stop them; but in the poem the absurdity is overlooked. The marvellous, however, is a cause of pleasure, as is shown by the fact that we all tell a story with additions, in the belief that we are doing our hearers a pleasure.

Homer more than any other has taught the rest of us the art of framing lies in the right way. I mean the use of paralogism. Whenever, if A is or happens, a consequent, B, is or happens, men's notion is that, if the B is, the A also is--but that is a false conclusion. Accordingly, if A is untrue, but there is something else, B, that on the assumption of its truth follows as its consequent, the right thing then is to add on the B. Just because we know the truth of the consequent, we are in our own minds led on to the erroneous inference of the truth of the antecedent. Here is an instance, from the Bath-story in the _Odyssey_.

A likely impossibility is always preferable to an unconvincing possibility. The story should never be made up of improbable incidents; there should be nothing of the sort in it. If, however, such incidents are unavoidable, they should be outside the piece, like the hero's ignorance in _Oedipus_ of the circumstances of Lams' death; not within it, like the report of the Pythian games in _Electra_, or the man's having come to Mysia from Tegea without uttering a word on the way, in _The Mysians_. So that it is ridiculous to say that one's Plot would have been spoilt without them, since it is fundamentally wrong to make up such Plots. If the poet has taken such a Plot, however, and one sees that he might have put it in a more probable form, he is guilty of absurdity as well as a fault of art. Even in the _Odyssey_ the improbabilities in the setting-ashore of Ulysses would be clearly intolerable in the hands of an inferior poet. As it is, the poet conceals them, his other excellences veiling their absurdity. Elaborate Diction, however, is required only in places where there is no action, and no Character or Thought to be revealed. Where there is Character or Thought, on the other hand, an over-ornate Diction tends to obscure them.

25

As regards Problems and their Solutions, one may see the number and nature of the assumptions on which they proceed by viewing the matter in the following way. (1) The poet being an imitator just like the painter or other maker of likenesses, he must necessarily in all instances represent things in one or other of three aspects, either as they were or are, or as they are said or thought to be or to have been, or as they ought to be. (2) All this he does in language, with an admixture, it may be, of strange words and metaphors, as also of the various modified forms of words, since the use of these is conceded in poetry. (3) It is to be remembered, too, that there is not the same kind of correctness in poetry as in politics, or indeed any other art. There is, however, within the limits of poetry itself a possibility of two kinds of error, the one directly, the other only accidentally connected with the art. If the poet meant to describe the thing correctly, and failed through lack of power of expression, his art itself is at fault. But if it was through his having meant to describe it in some incorrect way (e.g. to make the horse in movement have both right legs thrown forward) that the technical error (one in a matter of, say, medicine or some other special science), or impossibilities of whatever kind they may be, have got into his description, his error in that case is not in the essentials of the poetic art. These, therefore, must be the premisses of the Solutions in answer to the criticisms involved in the Problems.

I. As to the criticisms relating to the poet's art itself. Any impossibilities there may be in his descriptions of things are faults. But from another point of view they are justifiable, if they serve the end of poetry itself--if (to assume what we have said of that end) they make the effect of some portion of the work more astounding. The Pursuit of Hector is an instance in point. If, however, the poetic end might have been as well or better attained without sacrifice of technical correctness in such matters, the impossibility is not to be justified, since the description should be, if it can, entirely free from error. One may ask, too, whether the error is in a matter directly or only accidentally connected with the poetic art; since it is a lesser error in an artist not to know, for instance, that the hind

has no horns, than to produce an unrecognizable picture of one.

II. If the poet's description be criticized as not true to fact, one may urge perhaps that the object ought to be as described--an answer like that of Sophocles, who said that he drew men as they ought to be, and Euripides as they were. If the description, however, be neither true nor of the thing as it ought to be, the answer must be then, that it is in accordance with opinion. The tales about Gods, for instance, may be as wrong as Xenophanes thinks, neither true nor the better thing to say; but they are certainly in accordance with opinion. Of other statements in poetry one may perhaps say, not that they are better than the truth, but that the fact was so at the time; e.g. the description of the arms: 'their spears stood upright, butt-end upon the ground'; for that was the usual way of fixing them then, as it is still with the Illyrians. As for the question whether something said or done in a poem is morally right or not, in dealing with that one should consider not only the intrinsic quality of the actual word or deed, but also the person who says or does it, the person to whom he says or does it, the time, the means, and the motive of the agent--whether he does it to attain a greater good, or to avoid a greater evil.

III. Other criticisms one must meet by considering the language of the poet: (1) by the assumption of a strange word in a passage like _oureas men proton_, where by _oureas_ Homer may perhaps mean not mules but sentinels. And in saying of Dolon, _hos p e toi eidos men heen kakos_, his meaning may perhaps be, not that Dolon's body was deformed, but that his face was ugly, as _eneidos_ is the Cretan word for handsome-faced. So, too, _goroteron de keraie_ may mean not 'mix the wine stronger', as though for topers, but 'mix it quicker'. (2) Other expressions in Homer may be explained as metaphorical; e.g. in _halloi men ra theoi te kai aneres eudon (hapantes) pannux_ as compared with what he tells us at the same time, _e toi hot hes pedion to Troikon hathreseien, aulon suriggon *te homadon*_ the word _hapantes_ 'all', is metaphorically put for 'many', since 'all' is a species of 'many '. So also his _oie d' ammoros_ is metaphorical, the best known standing 'alone'. (3) A change, as Hippias suggested, in the mode of reading a word will solve the difficulty in _didomen de oi_, and _to men ou kataputhetai hombro_. (4) Other difficulties may be solved by another punctuation; e.g. in Empedocles, _aipsa de thnet ephyonto, ta prin mathon athanata xora te prin kekreto_. Or (5) by the assumption of an equivocal term, as in _parocheken de pleo nux_, where _pleo_ in equivocal. Or (6) by an appeal to the custom of language. Wine-and-water we call 'wine'; and it is on the same principle that Homer speaks of a _knemis neoteuktou kassiteroio_, a 'greave of new-wrought tin.' A worker in iron we call a 'brazier'; and it is on the same principle that Ganymede is described as the 'wine-server' of Zeus, though the Gods do not drink wine. This latter, however, may be an instance of metaphor. But whenever also a word seems to imply some contradiction, it is necessary to reflect how many ways there may be of understanding it in the passage in question; e.g. in Homer's _te r' hesxeto xalkeon hegxos_ one should consider the possible senses of 'was stopped there'--whether by taking it in this sense or in that one will best avoid the fault of which Glaucon speaks: 'They start with some improbable presumption; and having so decreed it themselves, proceed to draw inferences, and censure the poet as though he had actually said whatever they happen to believe, if his statement conflicts with their own notion of things.' This is how Homer's silence about Icarius has been treated. Starting with, the notion of his having been a Lacedaemonian, the critics think it strange for Telemachus not to have met him when he went to Lacedaemon. Whereas the fact may have been as the Cephallenians say, that the wife of Ulysses was of a Cephallenian family, and that her father's name was Icadius, not Icarius. So that it is probably a mistake of the critics that has given rise to the Problem.

Speaking generally, one has to justify (1) the Impossible by reference to the requirements of poetry, or to the better, or to opinion. For the purposes of poetry a convincing impossibility is preferable to an unconvincing possibility; and if men such as Zeuxis depicted be impossible, the answer is that it is better they should be like that, as the artist ought to improve on his model. (2) The Improbable one has to justify either by showing it to be in accordance with opinion, or by urging that at times it is not improbable; for there is a probability of things happening also against probability. (3) The contradictions found in the poet's language one should first test as one does an opponent's confutation in a dialectical argument, so as to see whether he means the same thing, in the same relation, and in the same sense, before admitting that he has contradicted either something he has said himself or what a man of sound sense assumes as true. But there is no possible apology for improbability of Plot or depravity of character, when they are not necessary and no use is made of them, like the improbability in the appearance of Aegeus in _Medea_ and the baseness of Menelaus in _Orestes_.

The objections, then, of critics start with faults of five kinds: the allegation is always that something in either (1) impossible, (2) improbable, (3) corrupting, (4) contradictory, or (5) against technical correctness. The answers to these objections must be sought under one or other of the above-mentioned heads, which are twelve in number.

The question may be raised whether the epic or the tragic is the higher form of imitation. It may be argued that, if the less vulgar is the higher, and the less vulgar is always that which addresses the better public, an art addressing any and every one is of a very vulgar order. It is a belief that their public cannot see the meaning, unless they add something themselves, that causes the perpetual movements of the performers--bad flute-players, for instance, rolling about, if quoit-throwing is to be represented, and pulling at the conductor, if Scylla is the subject of the piece. Tragedy, then, is said to be an art of this order--to be in fact just what the later actors were in the eyes of their predecessors; for Myrmiscus used to call Callippides 'the ape', because he thought he so overacted his parts; and a similar view was taken of Pindarus also. All Tragedy, however, is said to stand to the Epic as the newer to the older school of actors. The one, accordingly, is said to address a cultivated 'audience, which does not need the accompaniment of gesture; the other, an uncultivated one. If, therefore, Tragedy is a vulgar art, it must clearly be lower than the Epic.

The answer to this is twofold. In the first place, one may urge (1) that the censure does not touch the art of the dramatic poet, but only that of his interpreter; for it is quite possible to overdo the gesturing even in an epic recital, as did Sosistratus, and in a singing contest, as did Mnasitheus of Opus. (2) That one should not condemn all movement, unless one means to condemn even the dance, but only that of ignoble people--which is the point of the criticism passed on Callippides and in the present day on others, that their women are not like gentlewomen. (3) That Tragedy may produce its effect even without movement or action in just the same way as Epic poetry; for from the mere reading of a play its quality may be seen. So that, if it be superior in all other respects, this element of inferiority is not a necessary part of it.

In the second place, one must remember (1) that Tragedy has everything that the Epic has (even the epic metre being admissible), together with a not inconsiderable addition in the shape of the Music (a very real factor in the pleasure of the drama) and the Spectacle. (2) That its reality of presentation is felt in the play as read, as well as in the play as acted. (3) That the tragic imitation requires less space for the attainment of its end; which is a great advantage, since the more concentrated effect is more pleasurable than one with a large admixture of time to dilute it--consider the _Oedipus_ of Sophocles, for instance, and the effect of expanding it into the number of lines of the _Iliad_. (4) That there is less unity in the imitation of the epic poets, as is proved by the fact that any one work of theirs supplies matter for several tragedies; the result being that, if they take what is really a single story, it seems curt when briefly told, and thin and waterish when on the scale of length usual with their verse. In saying that there is less unity in an epic, I mean an epic made up of a plurality of actions, in the same way as the _Iliad_ and _Odyssey_ have many such parts, each one of them in itself of some magnitude; yet the structure of the two Homeric poems is as perfect as can be, and the action in them is as nearly as possible one action. If, then, Tragedy is superior in these respects, and also besides these, in its poetic effect (since the two forms of poetry should give us, not any or every pleasure, but the very special kind we have mentioned), it is clear that, as attaining the poetic effect better than the Epic, it will be the higher form of art.

So much for Tragedy and Epic poetry--for these two arts in general and their species; the number and nature of their constituent parts; the causes of success and failure in them; the Objections of the critics, and the Solutions in answer to them.

INTRODUCTION I. THE MORAL PURPOSE OF THE SCHOOL II. THE MORAL TRAINING GIVEN BY THE SCHOOL COMMUNITY III. THE MORAL TRAINING FROM METHODS OF INSTRUCTION IV. THE SOCIAL NATURE OF THE COURSE OF STUDY V. THE PSYCHOLOGICAL ASPECT OF MORAL EDUCATION OUTLINE

INTRODUCTION

Education as a public business

It is one of the complaints of the schoolmaster that the public does not defer to his professional opinion as completely as it does to that of practitioners in other professions. At first sight it might seem as though this indicated a defect either in the public or in the profession; and yet a wider view of the situation would suggest that such a conclusion is not a necessary one. The relations of education to the public are different from those of any other professional work. Education is a public business with us, in a sense that the protection and restoration of personal health or legal rights are not. To an extent characteristic of no other institution, save that of the state itself, the school has power to modify the social order. And under our political system, it is the right of each individual to have a voice in the making of social policies as, indeed, he has a vote in the determination of political affairs. If this be true, education is primarily a public business, and only secondarily a specialized vocation. The layman, then, will always have his right to some utterance on the operation of the public schools.

Education as expert service

I have said "some utterance," but not "all"; for school-mastering has its own special mysteries, its own knowledge and skill into which the untrained layman cannot penetrate. We are just beginning to recognize that the school and the government have a common problem in this respect. Education and politics are two functions fundamentally controlled by public opinion. Yet the conspicuous lack of efficiency and economy in the school and in the state has quickened our recognition of a larger need for expert service. But just where shall public opinion justly express itself, and what shall properly be left to expert judgment?

The relations of expert opinion and public opinion

In so far as broad policies and ultimate ends affecting the welfare of all are to be determined, the public may well claim its right to settle issues by the vote or voice of majorities. But the selection and prosecution of the detailed ways and means by which the public will is to be executed efficiently must remain largely a matter of specialized and expert service. To the superior knowledge and technique required here, the public may well defer.

In the conduct of the schools, it is well for the citizens to determine the ends proper to them, and it is their privilege to judge of the efficacy of results. Upon questions that concern all the manifold details by which children are to be converted into desirable types of men and women, the expert schoolmaster should be authoritative, at least to a degree commensurate with his superior knowledge of this very complex problem. The administration of the schools, the making of the course of study, the selection of texts, the prescription of methods of teaching, these are matters with which the people, or their representatives upon boards of education, cannot deal save with danger of becoming mere meddlers.

The discussion of moral education an illustration of mistaken views of laymen

Nowhere is the validity of this distinction between education as a public business and education as an expert professional service brought out more clearly than in an analysis of the public discussion of the moral work of the school. How frequently of late have those unacquainted with the special nature of the school proclaimed the moral ends of education and at the same time demanded direct ethical instruction as the particular method by which they were to be realized! This, too, in spite of the fact that those who know best the powers and limitations of instruction as an instrument have repeatedly pointed out the futility of assuming that knowledge of right constitutes a guarantee of right doing. How common it is for those who assert that education is for social efficiency to assume that the school should return to the barren discipline of the traditional formal subjects, reading, writing, and the rest! This, too, regardless of the fact that it has taken a century of educational evolution to make the course of study varied and rich enough to call for those impulses and activities of social life which need training in the child. And how many who speak glowingly of the large services of the public schools to a democracy of free and self-reliant men affect a cynical and even vehement opposition to the "self-government of schools"! These would not have the children learn to govern themselves and one another, but would have the masters rule them, ignoring the fact that this common practice in childhood may be a foundation for that evil condition in adult society where the citizens are arbitrarily ruled by political bosses.

One need not cite further cases of the incompetence of the lay public to deal with technical questions of school methods. Instances are plentiful to show that well-meaning people, competent enough to judge of the aims and results of school work, make a mistake in insisting upon the prerogative of directing the technical aspects of education with a dogmatism that would not characterize their statements regarding any other special field of knowledge or action.

A fundamental understanding of moral principles in education

Nothing can be more useful than for the public and the teaching profession to understand their respective functions. The teacher needs to understand public opinion and the social order, as much as the public needs to comprehend the nature of expert educational service. It will take time to draw the boundary lines that will be conducive to respect, restraint, and efficiency in those concerned; but a beginning can be made upon fundamental matters, and nothing so touches the foundations of our educational thought as a discussion of the moral principles in education.

It is our pleasure to present a treatment of them by a thinker whose vital influence upon the reform of school methods is greater than that of any of his contemporaries. In his discussion of the social and psychological factors in moral education, there is much that will suggest what social opinion should determine, and much that will indicate what must be left to the trained teacher and school official.

THE MORAL PURPOSE OF THE SCHOOL

I

THE MORAL PURPOSE OF THE SCHOOL

An English contemporary philosopher has called attention to the difference between moral ideas and ideas about morality. "Moral ideas" are ideas of any sort whatsoever which take effect in conduct and improve it, make it better than it otherwise would be. Similarly, one may say, immoral ideas are ideas of whatever sort (whether arithmetical or geographical or physiological) which show themselves in making behavior worse than it would otherwise be; and non-moral ideas, one may say, are such ideas and pieces of information as leave conduct uninfluenced for either the better or the worse. Now "ideas about morality" may be morally indifferent or immoral or moral. There is nothing in the nature of ideas _about_ morality, of information _about_ honesty or purity or kindness which automatically transmutes such ideas into good character or good conduct.

This distinction between moral ideas, ideas of any sort whatsoever that have become a part of character and hence a part of the working motives of behavior, and ideas _about_ moral action that may remain as inert and ineffective as if they were so much knowledge about Egyptian archaeology, is fundamental to the discussion of moral education. The business of the educator--whether parent or teacher--is to see to it that the greatest possible number of ideas acquired by children and youth are acquired in such a vital way that they become _moving_ ideas, motive-forces in the guidance of conduct. This demand and this opportunity make the moral purpose universal and dominant in all instruction--whatsoever the topic. Were it not for this possibility, the familiar statement that the ultimate purpose of all education is character-forming would be hypocritical pretense; for as every one knows, the direct and immediate attention of teachers and pupils must be, for the greater part of the time, upon intellectual matters. It is out of the question to keep direct moral considerations constantly uppermost. But it is not out of the question to aim at making the methods of learning, of acquiring intellectual power, and of assimilating subject-matter, such that they will render behavior more enlightened, more consistent, more vigorous than it otherwise would be.

The same distinction between "moral ideas" and "ideas about morality" explains for us a source of continual misunderstanding between teachers in the schools and critics of education outside of the schools. The latter look through the school programmes, the school courses of study, and do not find any place set apart for instruction in ethics or for "moral teaching." Then they assert that the schools are doing nothing, or next to nothing, for character-training; they become emphatic, even vehement, about the moral deficiencies of public education. The schoolteachers, on the other hand, resent these criticisms as an injustice, and hold not only that they do "teach morals," but that they teach them every moment of the day, five days in the week. In this contention the teachers _in principle_ are in the right; if they are in the wrong, it is not because special periods are not set aside for what after all can only be teaching _about_ morals, but because their own characters, or their school atmosphere and ideals, or their methods of teaching, or the subject-matter which they teach, are not such _in detail_ as to bring intellectual results into vital union with character so that they become working forces in behavior. Without discussing, therefore, the limits or the value of so-called direct moral instruction (or, better, instruction _about_ morals), it may be laid down as fundamental that the influence of direct moral instruction, even at its very best, is _comparatively_ small in amount and slight in influence, when the whole field of moral growth through education is taken into account. This larger field of indirect and vital moral education, the development of character through all the agencies, instrumentalities, and materials of school life is, therefore, the subject of our present discussion.

THE MORAL TRAINING GIVEN BY THE SCHOOL COMMUNITY

II

THE MORAL TRAINING GIVEN BY THE SCHOOL COMMUNITY

There cannot be two sets of ethical principles, one for life in the school, and the other for life outside of the school. As conduct is one, so also the principles of conduct are one. The tendency to discuss the morals of the school as if the school were an institution by itself is highly unfortunate. The moral responsibility of the school, and of those who conduct it, is to society. The school is fundamentally an institution erected by society to do a certain specific work,--to exercise a certain specific function in maintaining the life and advancing the welfare of society. The educational system which does not recognize that this fact entails upon it an ethical responsibility is derelict and a defaulter. It is not doing what it was called into existence to do, and what it pretends to do.

Hence the entire structure of the school in general and its concrete workings in particular need to be considered from time to time with reference to the social position and function of the school.

The idea that the moral work and worth of the public school system as a whole are to be measured by its social value is, indeed, a familiar notion. However, it is frequently taken in too limited and rigid a way. The social work of the school is often limited to training for citizenship, and citizenship is then interpreted in a narrow sense as meaning capacity to vote intelligently, disposition to obey laws, etc. But it is futile to contract and cramp the ethical responsibility of the school in this way. The child is one, and he must either live his social life as an integral unified being, or suffer loss and create friction. To pick out one of the many social relations which the child bears, and to define the work of the school by that alone, is like instituting a vast and complicated system of physical exercise which would have for its object simply the development of the lungs and the power of breathing, independent of other organs and functions. The child is an organic whole, intellectually, socially, and morally, as well as physically. We must take the child as a member of society in the broadest sense, and demand for and from the schools whatever is necessary to enable the child intelligently to recognize all his social relations and take his part in sustaining them.

To isolate the formal relationship of citizenship from the whole system of relations with which it is actually interwoven; to suppose that there is some one particular study or mode of treatment which can make the child a good citizen; to suppose, in other words, that a good citizen is anything more than a thoroughly efficient and serviceable member of society, one with all his powers of body and mind under control, is a hampering superstition which it is hoped may soon disappear from educational discussion.

The child is to be not only a voter and a subject of law; he is also to be a member of a family, himself in turn responsible, in all probability, for rearing and training of future children, thereby maintaining the continuity of society. He is to be a worker, engaged in some occupation which will be of use to society, and which will maintain his own independence and self-respect. He is to be a member of some particular neighborhood and community, and must contribute to the values of life, add to the decencies and graces of civilization wherever he is. These are bare and formal statements, but if we let our imagination translate them into their concrete details, we have a wide and varied scene. For the child properly to take his place in reference to these various functions means training in science, in art, in history; means command of the fundamental methods of inquiry and the fundamental tools of intercourse and communication; means a trained and sound body, skillful eye and hand; means habits of industry, perseverance; in short, habits of serviceableness.

Moreover, the society of which the child is to be a member is, in the United States, a democratic and progressive society. The child must be educated for leadership as well as for obedience. He must have power of self-direction and power of directing others, power of administration, ability to assume positions of responsibility. This necessity of educating for leadership is as great on the industrial as on the political side.

New inventions, new machines, new methods of transportation and intercourse are making over the whole scene of action year by year. It is an absolute impossibility to educate the child for any fixed station in life. So far as education is conducted unconsciously or consciously on this basis, it results in fitting the future citizen for no station in life, but makes him a drone, a hanger-on, or an actual retarding influence in the onward movement. Instead of caring for himself and for others, he becomes one who has himself to be cared for. Here, too, the ethical responsibility of the school on the social side must be interpreted in the broadest and freest spirit; it is equivalent to that training of the child which will give him such possession of himself that he may take charge of himself; may not only adapt himself to the changes that are going on, but have power to shape and direct them.

Apart from participation in social life, the school has no moral end nor aim. As long as we confine ourselves to the school as an isolated institution, we have no directing principles, because we have no object. For example, the end of education is said to be the harmonious development of all the powers of the individual. Here no reference to social life or membership is apparent, and yet many think we have in it an adequate and thoroughgoing definition of the goal of education. But if this definition be taken independently of social relationship we have no way of telling what is meant by any one of the terms employed. We do not know what a power is; we do not know what development is; we do not know what harmony is. A power is a power only with reference to the use to which it is put, the function it has to serve. If we leave out the uses supplied by social life we have nothing but the old "faculty psychology" to tell what is meant by power and what the specific powers are. The principle reduces itself to enumerating a lot of faculties like perception, memory, reasoning, etc., and then stating that each one of these powers needs to be developed.

Education then becomes a gymnastic exercise. Acute powers of observation and memory might be developed by studying Chinese characters; acuteness in reasoning might be got by discussing the scholastic subtleties of the Middle Ages. The simple fact is that

there is no isolated faculty of observation, or memory, or reasoning any more than there is an original faculty of blacksmithing, carpentering, or steam engineering. Faculties mean simply that particular impulses and habits have been coordinated or framed with reference to accomplishing certain definite kinds of work. We need to know the social situations in which the individual will have to use ability to observe, recollect, imagine, and reason, in order to have any way of telling what a training of mental powers actually means.

What holds in the illustration of this particular definition of education holds good from whatever point of view we approach the matter. Only as we interpret school activities with reference to the larger circle of social activities to which they relate do we find any standard for judging their moral significance.

The school itself must be a vital social institution to a much greater extent than obtains at present. I am told that there is a swimming school in a certain city where youth are taught to swim without going into the water, being repeatedly drilled in the various movements which are necessary for swimming. When one of the young men so trained was asked what he did when he got into the water, he laconically replied, "Sunk." The story happens to be true; were it not, it would seem to be a fable made expressly for the purpose of typifying the ethical relationship of school to society. The school cannot be a preparation for social life excepting as it reproduces, within itself, typical conditions of social life. At present it is largely engaged in the futile task of Sisyphus. It is endeavoring to form habits in children for use in a social life which, it would almost seem, is carefully and purposely kept away from vital contact with the child undergoing training. The only way to prepare for social life is to engage in social life. To form habits of social usefulness and serviceableness apart from any direct social need and motive, apart from any existing social situation, is, to the letter, teaching the child to swim by going through motions outside of the water. The most indispensable condition is left out of account, and the results are correspondingly partial.

The much lamented separation in the schools of intellectual and moral training, of acquiring information and growing in character, is simply one expression of the failure to conceive and construct the school as a social institution, having social life and value within itself. Except so far as the school is an embryonic typical community life, moral training must be partly pathological and partly formal. Training is pathological when stress is laid upon correcting wrong-doing instead of upon forming habits of positive service. Too often the teacher's concern with the moral life of pupils takes the form of alertness for failures to conform to school rules and routine. These regulations, judged from the standpoint of the development of the child at the time, are more or less conventional and arbitrary. They are rules which have to be made in order that the existing modes of school work may go on; but the lack of inherent necessity in these school modes reflects itself in a feeling, on the part of the child, that the moral discipline of the school is arbitrary. Any conditions that compel the teacher to take note of failures rather than of healthy growth give false standards and result in distortion and perversion. Attending to wrong-doing ought to be an incident rather than a principle. The child ought to have a positive consciousness of what he is about, so as to judge his acts from the standpoint of reference to the work which he has to do. Only in this way does he have a vital standard, one that enables him to turn failures to account for the future.

By saying that the moral training of the school is formal, I mean that the moral habits currently emphasized by the school are habits which are created, as it were, _ad hoc_. Even the habits of promptness, regularity, industry, non-interference with the work of others, faithfulness to tasks imposed, which are specially inculcated in the school, are habits that are necessary simply because the school system is what it is, and must be preserved intact. If we grant the inviolability of the school system as it is, these habits represent permanent and necessary moral ideas; but just in so far as the school system is itself isolated and mechanical, insistence upon these moral habits is more or less unreal, because the ideal to which they relate is not itself necessary. The duties, in other words, are distinctly school duties, not life duties. If we compare this condition with that of the well-ordered home, we find that the duties and responsibilities that the child has there to recognize do not belong to the family as a specialized and isolated institution, but flow from the very nature of the social life in which the family participates and to which it contributes. The child ought to have the same motives for right doing and to be judged by the same standards in the school, as the adult in the wider social life to which he belongs. Interest in community welfare, an interest that is intellectual and practical, as well as emotional--an interest, that is to say, in perceiving whatever makes for social order and progress, and in carrying these principles into execution--is the moral habit to which all the special school habits must be related if they are to be animated by the breath of life.

THE MORAL TRAINING FROM METHODS OF INSTRUCTION

III

THE MORAL TRAINING FROM METHODS OF INSTRUCTION

The principle of the social character of the school as the basic factor in the moral education given may be also applied to the question of methods of instruction,--not in their details, but their general spirit. The emphasis then falls upon construction and giving out, rather than upon absorption and mere learning. We fail to recognize how essentially individualistic the latter methods are, and how unconsciously, yet certainly and effectively, they react into the child's ways of judging and of acting. Imagine forty children all engaged in reading the same books, and in preparing and reciting the same lessons day after day. Suppose this process constitutes by far the larger part of their work, and that they are continually judged from the standpoint of what they are able to take in in a study hour and reproduce in a recitation hour. There is next to no opportunity for any social division of labor. There is no opportunity for each child to work out something specifically his own, which he may contribute to the common stock, while he, in turn, participates in the productions of others. All are set to do exactly the same work and turn out the same products. The social spirit is not cultivated,--in fact, in so far as the purely individualistic method gets in its work, it atrophies for lack of use. One reason why reading aloud in school is poor is that the real motive for the use of language--the desire to communicate and to learn--is not utilized. The child knows perfectly well that the teacher and all his fellow pupils have exactly the same facts and ideas before them that he has; he is not _giving_ them anything at all. And it may be questioned whether the moral lack is not as great as the intellectual. The child is born with a natural desire to give out, to do, to serve. When this tendency is not used, when conditions are such that other motives are substituted, the accumulation of an influence working against the social spirit is much larger than we have any idea of,--especially when the burden of work, week after week, and year after year, falls upon this side.

But lack of cultivation of the social spirit is not all. Positively individualistic motives and standards are inculcated. Some stimulus must be found to keep the child at his studies. At the best this will be his affection for his teacher, together with a feeling that he is not violating school rules, and thus negatively, if not positively, is contributing to the good of the school. I have nothing to say against these motives so far as they go, but they are inadequate. The relation between the piece of work to be done and affection for a third person is external, not intrinsic. It is therefore liable to break down whenever the external conditions are changed. Moreover, this attachment to a particular person, while in a way social, may become so isolated and exclusive as to be selfish in quality. In any case, the child should gradually grow out of this relatively external motive into an appreciation, for its own sake, of the social value of what he has to do, because of its larger relations to life, not pinned down to two or three persons.

But, unfortunately, the motive is not always at this relative best, but mixed with lower motives which are distinctly egoistic. Fear is a motive which is almost sure to enter in,--not necessarily physical fear, or fear of punishment, but fear of losing the approbation of others; or fear of failure, so extreme as to be morbid and paralyzing. On the other side, emulation and rivalry enter in. Just because all are doing the same work, and are judged (either in recitation or examination with reference to grading and to promotion) not from the standpoint of their personal contribution, but from that of _comparative_ success, the feeling of superiority over others is unduly appealed to, while timid children are depressed. Children are judged with reference to their capacity to realize the same external standard. The weaker gradually lose their sense of power, and accept a position of continuous and persistent inferiority. The effect upon both self-respect and respect for work need not be dwelt upon. The strong learn to glory, not in their strength, but in the fact that they are stronger. The child is prematurely launched into the region of individualistic competition, and this in a direction where competition is least applicable, namely, in intellectual and artistic matters, whose law is cooperation and participation.

Next, perhaps, to the evils of passive absorption and of competition for external standing come, perhaps, those which result from the eternal emphasis upon preparation for a remote future. I do not refer here to the waste of energy and vitality that accrues when children, who live so largely in the immediate present, are appealed to in the name of a dim and uncertain future which means little or nothing to them. I have in mind rather the habitual procrastination that develops when the motive for work is future, not present; and the false standards of judgment that are created when work is estimated, not on the basis of present need and present responsibility, but by reference to an external result, like passing an examination, getting promoted, entering high school, getting into college, etc. Who can reckon up the loss of moral power that arises from the constant impression that nothing is worth doing in itself, but only as a preparation for something else, which in turn is only a getting ready for some genuinely serious end beyond? Moreover, as a rule, it will be found that remote success is an end which appeals most to those in whom egoistic desire to get ahead--to get ahead of others--is already only too strong a motive. Those in whom personal ambition is already so strong that it paints glowing pictures of future victories may be touched; others of a more generous nature do not respond.

I cannot stop to paint the other side. I can only say that the introduction of every method that appeals to the child's active powers, to his capacities in construction, production, and creation, marks an opportunity to shift the centre of ethical gravity from an absorption which is selfish to a service which is social. Manual training is more than manual; it is more than intellectual; in the hands of any good teacher it lends itself easily, and almost as a matter of course, to development of social habits. Ever since the philosophy of

Kant, it has been a commonplace of aesthetic theory, that art is universal; that it is not the product of purely personal desire or appetite, or capable of merely individual appropriation, but has a value participated in by all who perceive it. Even in the schools where most conscious attention is paid to moral considerations, the methods of study and recitation may be such as to emphasize appreciation rather than power, an emotional readiness to assimilate the experiences of others, rather than enlightened and trained capacity to carry forward those values which in other conditions and past times made those experiences worth having. At all events, separation between instruction and character continues in our schools (in spite of the efforts of individual teachers) as a result of divorce between learning and doing. The attempt to attach genuine moral effectiveness to the mere processes of learning, and to the habits which go along with learning, can result only in a training infected with formality, arbitrariness, and an undue emphasis upon failure to conform. That there is as much accomplished as there is shows the possibilities involved in methods of school activity which afford opportunity for reciprocity, cooperation, and positive personal achievement.

THE SOCIAL NATURE OF THE COURSE OF STUDY

IV

THE SOCIAL NATURE OF THE COURSE OF STUDY

In many respects, it is the subject-matter used in school life which decides both the general atmosphere of the school and the methods of instruction and discipline which rule. A barren "course of study," that is to say, a meagre and narrow field of school activities, cannot possibly lend itself to the development of a vital social spirit or to methods that appeal to sympathy and cooperation instead of to absorption, exclusiveness, and competition. Hence it becomes an all important matter to know how we shall apply our social standard of moral value to the subject-matter of school work, to what we call, traditionally, the "studies" that occupy pupils.

A study is to be considered as a means of bringing the child to realize the social scene of action. Thus considered it gives a criterion for selection of material and for judgment of values. We have at present three independent values set up: one of culture, another of information, and another of discipline. In reality, these refer only to three phases of social interpretation. Information is genuine or educative only in so far as it presents definite images and conceptions of materials placed in a context of social life. Discipline is genuinely educative only as it represents a reaction of information into the individual's own powers so that he brings them under control for social ends. Culture, if it is to be genuinely educative and not an external polish or factitious varnish, represents the vital union of information and discipline. It marks the socialization of the individual in his outlook upon life.

This point may be illustrated by brief reference to a few of the school studies. In the first place, there is no line of demarkation within facts themselves which classifies them as belonging to science, history, or geography, respectively. The pigeon-hole classification which is so prevalent at present (fostered by introducing the pupil at the outset into a number of different studies contained in different text-books) gives an utterly erroneous idea of the relations of studies to one another and to the intellectual whole to which all belong. In fact, these subjects have to do with the same ultimate reality, namely, the conscious experience of man. It is only because we have different interests, or different ends, that we sort out the material and label part of it science, part of it history, part geography, and so on. Each "sorting" represents materials arranged with reference to some one dominant typical aim or process of the social life.

This social criterion is necessary, not only to mark off studies from one another, but also to grasp the reasons for each study,--the motives in connection with which it shall be presented. How, for example, should we define geography? What is the unity in the different so-called divisions of geography,--mathematical geography, physical geography, political geography, commercial geography? Are they purely empirical classifications dependent upon the brute fact that we run across a lot of different facts? Or is there some intrinsic principle through which the material is distributed under these various heads,--something in the interest and attitude of the human mind towards them? I should say that geography has to do with all those aspects of social life which are concerned with the interaction of the life of man and nature; or, that it has to do with the world considered as the scene of social interaction. Any fact, then, will be geographical in so far as it has to do with the dependence of man upon his natural environment, or with changes introduced in this environment through the life of man.

The four forms of geography referred to above represent, then, four increasing stages of abstraction in discussing the mutual relation of human life and nature. The beginning must be social geography, the frank recognition of the earth as the home of men acting in relations to one another. I mean by this that the essence of any geographical fact is the consciousness of two persons, or

two groups of persons, who are at once separated and connected by their physical environment, and that the interest is in seeing how these people are at once kept apart and brought together in their actions by the instrumentality of the physical environment. The ultimate significance of lake, river, mountain, and plain is not physical but social; it is the part which it plays in modifying and directing human relationships. This evidently involves an extension of the term commercial. It has to do not simply with business, in the narrow sense, but with whatever relates to human intercourse and intercommunication as affected by natural forms and properties. Political geography represents this same social interaction taken in a static instead of in a dynamic way; taken, that is, as temporarily crystallized and fixed in certain forms. Physical geography (including under this not simply physiography, but also the study of flora and fauna) represents a further analysis or abstraction. It studies the conditions which determine human action, leaving out of account, temporarily, the ways in which they concretely do this. Mathematical geography carries the analysis back to more ultimate and remote conditions, showing that the physical conditions of the earth are not ultimate, but depend upon the place which the world occupies in a larger system. Here, in other words, are traced, step by step, the links which connect the immediate social occupations and groupings of men with the whole natural system which ultimately conditions them. Step by step the scene is enlarged and the image of what enters into the make-up of social action is widened and broadened; at no time is the chain of connection to be broken.

It is out of the question to take up the studies one by one and show that their meaning is similarly controlled by social considerations. But I cannot forbear saying a word or two upon history. History is vital or dead to the child according as it is, or is not, presented from the sociological standpoint. When treated simply as a record of what has passed and gone, it must be mechanical, because the past, as the past, is remote. Simply as the past there is no motive for attending to it. The ethical value of history teaching will be measured by the extent to which past events are made the means of understanding the present,--affording insight into what makes up the structure and working of society to-day. Existing social structure is exceedingly complex. It is practically impossible for the child to attack it _en masse_ and get any definite mental image of it. But type phases of historical development may be selected which will exhibit, as through a telescope, the essential constituents of the existing order. Greece, for example, represents what art and growing power of individual expression stand for; Rome exhibits the elements and forces of political life on a tremendous scale. Or, as these civilizations are themselves relatively complex, a study of still simpler forms of hunting, nomadic, and agricultural life in the beginnings of civilization, a study of the effects of the introduction of iron, and iron tools, reduces the complexity to simpler elements.

One reason historical teaching is usually not more effective is that the student is set to acquire information in such a way that no epochs or factors stand out in his mind as typical; everything is reduced to the same dead level. The way to secure the necessary perspective is to treat the past as if it were a projected present with some of its elements enlarged.

The principle of contrast is as important as that of similarity. Because the present life is so close to us, touching us at every point, we cannot get away from it to see it as it really is. Nothing stands out clearly or sharply as characteristic. In the study of past periods, attention necessarily attaches itself to striking differences. Thus the child gets a locus of imagination, through which he can remove himself from the pressure of present surrounding circumstances and define them.

History is equally available in teaching the _methods_ of social progress. It is commonly stated that history must be studied from the standpoint of cause and effect. The truth of this statement depends upon its interpretation. Social life is so complex and the various parts of it are so organically related to one another and to the natural environment, that it is impossible to say that this or that thing is the cause of some other particular thing. But the study of history can reveal the main instruments in the discoveries, inventions, new modes of life, etc., which have initiated the great epochs of social advance; and it can present to the child types of the main lines of social progress, and can set before him what have been the chief difficulties and obstructions in the way of progress. Once more this can be done only in so far as it is recognized that social forces in themselves are always the same,--that the same kind of influences were at work one hundred and one thousand years ago that are now working,--and that particular historical epochs afford illustration of the way in which the fundamental forces work.

Everything depends, then, upon history being treated from a social standpoint; as manifesting the agencies which have influenced social development and as presenting the typical institutions in which social life has expressed itself. The culture-epoch theory, while working in the right direction, has failed to recognize the importance of treating past periods with relation to the present,--as affording insight into the representative factors of its structure; it has treated these periods too much as if they had some meaning or value in themselves. The way in which the biographical method is handled illustrates the same point. It is often treated in such a way as to exclude from the child's consciousness (or at least not sufficiently to emphasize) the social forces and principles involved in the association of the masses of men. It is quite true that the child is easily interested in history from the biographical standpoint;

but unless "the hero" is treated in relation to the community life behind him that he sums up and directs, there is danger that history will reduce itself to a mere exciting story. Then moral instruction reduces itself to drawing certain lessons from the life of the particular personalities concerned, instead of widening and deepening the child's imagination of social relations, ideals, and means.

It will be remembered that I am not making these points for their own sake, but with reference to the general principle that when a study is taught as a mode of understanding social life it has positive ethical import. What the normal child continuously needs is not so much isolated moral lessons upon the importance of truthfulness and honesty, or the beneficent results that follow from a particular act of patriotism, as the formation of habits of social imagination and conception.

I take one more illustration, namely, mathematics. This does, or does not, accomplish its full purpose according as it is, or is not, presented as a social tool. The prevailing divorce between information and character, between knowledge and social action, stalks upon the scene here. The moment mathematical study is severed from the place which it occupies with reference to use in social life, it becomes unduly abstract, even upon the purely intellectual side. It is presented as a matter of technical relations and formulae apart from any end or use. What the study of number suffers from in elementary education is lack of motivation. Back of this and that and the other particular bad method is the radical mistake of treating number as if it were an end in itself, instead of the means of accomplishing some end. Let the child get a consciousness of what is the use of number, of what it really is for, and half the battle is won. Now this consciousness of the use of reason implies some end which is implicitly social.

One of the absurd things in the more advanced study of arithmetic is the extent to which the child is introduced to numerical operations which have no distinctive mathematical principles characterizing them, but which represent certain general principles found in business relationships. To train the child in these operations, while paying no attention to the business realities in which they are of use, or to the conditions of social life which make these business activities necessary, is neither arithmetic nor common sense. The child is called upon to do examples in interest, partnership, banking, brokerage, and so on through a long string, and no pains are taken to see that, in connection with the arithmetic, he has any sense of the social realities involved. This part of arithmetic is essentially sociological in its nature. It ought either to be omitted entirely, or else be taught in connection with a study of the relevant social realities. As we now manage the study, it is the old case of learning to swim apart from the water over again, with correspondingly bad results on the practical side.

In concluding this portion of the discussion, we may say that our conceptions of moral education have been too narrow, too formal, and too pathological. We have associated the term ethical with certain special acts which are labeled virtues and are set off from the mass of other acts, and are still more divorced from the habitual images and motives of the children performing them. Moral instruction is thus associated with teaching about these particular virtues, or with instilling certain sentiments in regard to them. The moral has been conceived in too goody-goody a way. Ultimate moral motives and forces are nothing more or less than social intelligence--the power of observing and comprehending social situations,--and social power--trained capacities of control--at work in the service of social interest and aims. There is no fact which throws light upon the constitution of society, there is no power whose training adds to social resourcefulness that is not moral.

I sum up, then, this part of the discussion by asking your attention to the moral trinity of the school. The demand is for social intelligence, social power, and social interests. Our resources are (1) the life of the school as a social institution in itself; (2) methods of learning and of doing work; and (3) the school studies or curriculum. In so far as the school represents, in its own spirit, a genuine community life; in so far as what are called school discipline, government, order, etc., are the expressions of this inherent social spirit; in so far as the methods used are those that appeal to the active and constructive powers, permitting the child to give out and thus to serve; in so far as the curriculum is so selected and organized as to provide the material for affording the child a consciousness of the world in which he has to play a part, and the demands he has to meet; so far as these ends are met, the school is organized on an ethical basis. So far as general principles are concerned, all the basic ethical requirements are met. The rest remains between the individual teacher and the individual child.

THE PSYCHOLOGICAL ASPECT OF MORAL EDUCATION

V

THE PSYCHOLOGICAL ASPECT OF MORAL EDUCATION

So far we have been considering the make-up of purposes and results that constitute conduct--its "what." But conduct has a certain method and spirit also--its "how." Conduct may be looked upon as expressing the attitudes and dispositions of an _individual_, as well as realizing social results and maintaining the social fabric. A consideration of conduct as a mode of individual performance, personal doing, takes us from the social to the psychological side of morals. In the first place, all conduct springs ultimately and radically out of native instincts and impulses. We must know what these instincts and impulses are, and what they are at each particular stage of the child's development, in order to know what to appeal to and what to build upon. Neglect of this principle may give a mechanical imitation of moral conduct, but the imitation will be ethically dead, because it is external and has its centre without, not within, the individual. We must study the child, in other words, to get our indications, our symptoms, our suggestions. The more or less spontaneous acts of the child are not to be thought of as setting moral forms to which the efforts of the educator must conform--this would result simply in spoiling the child; but they are symptoms which require to be interpreted: stimuli which need to be responded to in directed ways; material which, in however transformed a shape, is the only ultimate constituent of future moral conduct and character.

Then, secondly, our ethical principles need to be stated in psychological terms because the child supplies us with the only means or instruments by which to realize moral ideals. The subject-matter of the curriculum, however important, however judiciously selected, is empty of conclusive moral content until it is made over into terms of the individual's own activities, habits, and desires. We must know what history, geography, and mathematics mean in psychological terms, that is, as modes of personal experiencing, before we can get out of them their moral potentialities.

The psychological side of education sums itself up, of course, in a consideration of character. It is a commonplace to say that the development of character is the end of all school work. The difficulty lies in the execution of the idea. And an underlying difficulty in this execution is the lack of a clear conception of what character means. This may seem an extreme statement. If so, the idea may be conveyed by saying that we generally conceive of character simply in terms of results; we have no clear conception of it in psychological terms--that is, as a process, as working or dynamic. We know what character means in terms of the actions which proceed from it, but we have not a definite conception of it on its inner side, as a system of working forces.

(1) Force, efficiency in execution, or overt action, is one necessary constituent of character. In our moral books and lectures we may lay the stress upon good intentions, etc. But we know practically that the kind of character we hope to build up through our education is one that not only has good intentions, but that insists upon carrying them out. Any other character is wishy-washy; it is goody, not good. The individual must have the power to stand up and count for something in the actual conflicts of life. He must have initiative, insistence, persistence, courage, and industry. He must, in a word, have all that goes under the name "_force_ of character." Undoubtedly, individuals differ greatly in their native endowment in this respect. None the less, each has a certain primary equipment of impulse, of tendency forward, of innate urgency to do. The problem of education on this side is that of discovering what this native fund of power is, and then of utilizing it in such a way (affording conditions which both stimulate and control) as to organize it into definite conserved modes of action--habits.

(2) But something more is required than sheer force. Sheer force may be brutal; it may override the interests of others. Even when aiming at right ends it may go at them in such a way as to violate the rights of others. More than this, in sheer force there is no guarantee for the right end. Efficiency may be directed towards mistaken ends and result in positive mischief and destruction. Power, as already suggested, must be directed. It must be organized along social channels; it must be attached to valuable ends.

This involves training on both the intellectual and emotional side. On the intellectual side we must have judgment--what is ordinarily called good sense. The difference between mere knowledge, or information, and judgment is that the former is simply held, not used; judgment is knowledge directed with reference to the accomplishment of ends. Good judgment is a sense of respective or proportionate values. The one who has judgment is the one who has ability to size up a situation. He is the one who can grasp the scene or situation before him, ignoring what is irrelevant, or what for the time being is unimportant, who can seize upon the factors which demand attention, and grade them according to their respective claims. Mere knowledge of what the right is, in the abstract, mere intentions of following the right in general, however praiseworthy in themselves, are never a substitute for this power of trained judgment. Action is always in the concrete. It is definite and individualized. Except, therefore, as it is backed and controlled by a knowledge of the actual concrete factors in the situation in which it occurs, it must be relatively futile and waste.

(3) But the consciousness of ends must be more than merely intellectual. We can imagine a person with most excellent judgment, who yet does not act upon his judgment. There must not only be force to ensure effort in execution against obstacles, but there must also be a delicate personal responsiveness,--there must be an emotional reaction. Indeed, good judgment is impossible

without this susceptibility. Unless there is a prompt and almost instinctive sensitiveness to conditions, to the ends and interests of others, the intellectual side of judgment will not have proper material to work upon. Just as the material of knowledge is supplied through the senses, so the material of ethical knowledge is supplied by emotional responsiveness. It is difficult to put this quality into words, but we all know the difference between the character which is hard and formal, and one which is sympathetic, flexible, and open. In the abstract the former may be as sincerely devoted to moral ideas as is the latter, but as a practical matter we prefer to live with the latter. We count upon it to accomplish more by tact, by instinctive recognition of the claims of others, by skill in adjusting, than the former can accomplish by mere attachment to rules.

Here, then, is the moral standard, by which to test the work of the school upon the side of what it does directly for individuals. (_a_) Does the school as a system, at present, attach sufficient importance to the spontaneous instincts and impulses? Does it afford sufficient opportunity for these to assert themselves and work out their own results? Can we even say that the school in principle attaches itself, at present, to the active constructive powers rather than to processes of absorption and learning? Does not our talk about self-activity largely render itself meaningless because the self-activity we have in mind is purely "intellectual," out of relation to those impulses which work through hand and eye?

Just in so far as the present school methods fail to meet the test of such questions moral results must be unsatisfactory. We cannot secure the development of positive force of character unless we are willing to pay its price. We cannot smother and repress the child's powers, or gradually abort them (from failure of opportunity for exercise), and then expect a character with initiative and consecutive industry. I am aware of the importance attaching to inhibition, but mere inhibition is valueless. The only restraint, the only holding-in, that is of any worth is that which comes through holding powers concentrated upon a positive end. An end cannot be attained excepting as instincts and impulses are kept from discharging at random and from running off on side tracks. In keeping powers at work upon their relevant ends, there is sufficient opportunity for genuine inhibition. To say that inhibition is higher than power, is like saying that death is more than life, negation more than affirmation, sacrifice more than service.

(_b_) We must also test our school work by finding whether it affords the conditions necessary for the formation of good judgment. Judgment as the sense of relative values involves ability to select, to discriminate. Acquiring information can never develop the power of judgment. Development of judgment is in spite of, not because of, methods of instruction that emphasize simple learning. The test comes only when the information acquired has to be put to use. Will it do what we expect of it? I have heard an educator of large experience say that in her judgment the greatest defect of instruction to-day, on the intellectual side, is found in the fact that children leave school without a mental perspective. Facts seem to them all of the same importance. There is no foreground or background. There is no instinctive habit of sorting out facts upon a scale of worth and of grading them.

The child cannot get power of judgment excepting as he is continually exercised in forming and testing judgments. He must have an opportunity to select for himself, and to attempt to put his selections into execution, that he may submit them to the final test, that of action. Only thus can he learn to discriminate that which promises success from that which promises failure; only thus can he form the habit of relating his purposes and notions to the conditions that determine their value. Does the school, as a system, afford at present sufficient opportunity for this sort of experimentation? Except so far as the emphasis of the school work is upon intelligent doing, upon active investigation, it does not furnish the conditions necessary for that exercise of judgment which is an integral factor in good character.

(_c_) I shall be brief with respect to the other point, the need of susceptibility and responsiveness. The informally social side of education, the aesthetic environment and influences, are all-important. In so far as the work is laid out in regular and formulated ways, so far as there are lacking opportunities for casual and free social intercourse between pupils and between the pupils and the teacher, this side of the child's nature is either starved, or else left to find haphazard expression along more or less secret channels. When the school system, under plea of the practical (meaning by the practical the narrowly utilitarian), confines the child to the three R's and the formal studies connected with them, shuts him out from the vital in literature and history, and deprives him of his right to contact with what is best in architecture, music, sculpture, and picture, it is hopeless to expect definite results in the training of sympathetic openness and responsiveness.

* * * * *

What we need in education is a genuine faith in the existence of moral principles which are capable of effective application. We believe, so far as the mass of children are concerned, that if we keep at them long enough we can teach reading and writing and figuring. We are practically, even if unconsciously, skeptical as to the possibility of anything like the same assurance in morals. We

believe in moral laws and rules, to be sure, but they are in the air. They are something set off by themselves. They are so _very_ "moral" that they have no working contact with the average affairs of every-day life. These moral principles need to be brought down to the ground through their statement in social and in psychological terms. We need to see that moral principles are not arbitrary, that they are not "transcendental"; that the term "moral" does not designate a special region or portion of life. We need to translate the moral into the conditions and forces of our community life, and into the impulses and habits of the individual.

All the rest is mint, anise, and cummin. The one thing needful is that we recognize that moral principles are real in the same sense in which other forces are real; that they are inherent in community life, and in the working structure of the individual. If we can secure a genuine faith in this fact, we shall have secured the condition which alone is necessary to get from our educational system all the effectiveness there is in it. The teacher who operates in this faith will find every subject, every method of instruction, every incident of school life pregnant with moral possibility.

OUTLINE

I. THE MORAL PURPOSE OF THE SCHOOL 1. Moral ideas and ideas about morality 2. Moral education and direct moral instruction

II. THE MORAL TRAINING GIVEN BY THE SCHOOL COMMUNITY 1. The unity of social ethics and school ethics 2. A narrow and formal training for citizenship 3. School life should train for many social relations 4. It should train for self-direction and leadership 5. There is no harmonious development of powers apart from social situations 6. School activities should be typical of social life 7. Moral training in the schools tends to be pathological and formal

III. THE MORAL TRAINING FROM METHODS OF INSTRUCTION 1. Active social service as opposed to passive individual absorption 2. The positive inculcation of individualistic motives and standards 3. The evils of competition for external standing 4. The moral waste of remote success as an end 5. The worth of active and social modes of learning

IV. THE SOCIAL NATURE OF THE COURSE OF STUDY 1. The nature of the course of study influences the conduct of the school 2. School studies as means of realizing social situations 3. School subjects are merely phases of a unified social life 4. The meaning of subjects is controlled by social considerations 5. Geography deals with the scenes of social interaction 6. Its various forms represent increasing stages of abstraction 7. History is a means for interpreting existing social relations 8. It presents type phases of social development 9. It offers contrasts, and consequently perspective 10. It teaches the methods of social progress 11. The failure of certain methods of teaching history 12. Mathematics is a means to social ends 13. The sociological nature of business arithmetic 14. Summary: The moral trinity of the school

V. THE PSYCHOLOGICAL ASPECT OF MORAL EDUCATION 1. Conduct as a mode of individual performance 2. Native instincts and impulses are the sources of conduct 3. Moral ideals must be realized in persons 4. Character as a system of working forces 5. Force as a necessary constituent of character 6. The importance of intellectual judgment or good sense 7. The capacity for delicate emotional responsiveness 8. Summary: The ethical standards for testing the school 9. Conclusion: The practicality of moral principles

PREFACE.

One special object which the author of this series has had in view, in the plan and method which he has followed in the preparation of the successive volumes, has been to adapt them to the purposes of text-books in schools. The study of a _general compend_ of history, such as is frequently used as a text-book, is highly useful, if it comes in at the right stage of education, when the mind is sufficiently matured, and has acquired sufficient preliminary knowledge to understand and appreciate so condensed a generalization as a summary of the whole history of a nation contained in an ordinary volume must necessarily be. Without this degree of maturity of mind, and this preparation, the study of such a work will be, as it too frequently is, a mere mechanical committing to memory of names, and dates, and phrases, which awaken no interest, communicate no ideas, and impart no useful knowledge to the mind.

A class of ordinary pupils, who have not yet become much acquainted with history, would, accordingly, be more benefited by having their attention concentrated, at first, on detached and separate topics, such as those which form the subjects, respectively, of these volumes. By studying thus fully the history of individual monarchs, or the narratives of single events, they can go more fully into detail; they conceive of the transactions described as realities; their reflecting and reasoning powers are occupied on what they read; they take notice of the motives of conduct, of the gradual development of character, the good or ill desert of actions, and of the connection of causes and consequences, both in respect to the influence of wisdom and virtue on the one hand, and, on the other, of folly and crime. In a word, their _minds_ and _hearts_ are occupied instead of merely their memories. They reason, they sympathize, they pity, they approve, and they condemn. They enjoy the real and true pleasure which constitutes the charm of historical study for minds that are mature; and they acquire a taste for truth instead of fiction, which will tend to direct their reading into proper channels in all future years.

The use of these works, therefore, as text-books in classes, has been kept continually in mind in the preparation of them. The running index on the tops of the pages is intended to serve instead of questions. These captions can be used in their present form as _topics_, in respect to which, when announced in the class, the pupils are to repeat substantially what is said on the page; or, on the other hand, questions in form, if that mode is preferred, can be readily framed from them by the teacher. In all the volumes, a very regular system of division is observed, which will greatly facilitate the assignment of lessons.

CHAPTER I.

THE MOTHER OF XERXES.

B.C. 522-484

Persian magnificence.--The mother of Xerxes.--Cambyses.--Ambition and selfishness of kings.--General influence exerted by great sovereigns upon the community.--Labors of great conquerors.--Caesar.--Darius.--William the Conqueror.--Napoleon.--Heroes and conquerors.--The main spring of their actions.--Cyrus.--Character and career of Cambyses.--Wives of Cambyses.--He marries his sister.--Death of Cambyses.--Smerdis the magian.--Cunning of Smerdis.--His feeling of insecurity.--Smerdis suspected.--His

imposture discovered.--Death of Smerdis.--Succession of Darius.--Atossa's sickness.--The Greek physician.--Atossa's promise.--Atossa's conversation with Darius.--Success of her plans.--The expedition to Greece.--Escape of the physician.--Atossa's four sons.--Artobazanes.--Dispute about the succession.--Xerxes and Artobazanes.--The arguments.--Influence of Atossa.--The Spartan fugitive.--His views of the succession.--The decision.--Death of Darius.

The name of Xerxes is associated in the minds of men with the idea of the highest attainable elevation of human magnificence and grandeur. This monarch was the sovereign of the ancient Persian empire when it was at the height of its prosperity and power. It is probable, however, that his greatness and fame lose nothing by the manner in which his story comes down to us through the Greek historians. The Greeks conquered Xerxes, and, in relating his history, they magnify the wealth, the power, and the resources of his empire, by way of exalting the greatness and renown of their own exploits in subduing him.

The mother of Xerxes was Atossa, a daughter of Cyrus the Great, who was the founder of the Persian empire. Cyrus was killed in Scythia, a wild and barbarous region lying north of the Black and Caspian Seas. His son Cambyses succeeded him.

A kingdom, or an empire, was regarded, in ancient days, much in the light of an estate, which the sovereign held as a species of property, and which he was to manage mainly with a view to the promotion of his own personal aggrandizement and pleasure. A king or an emperor could have more palaces, more money, and more wives than other men; and if he was of an overbearing or ambitious spirit, he could march into his neighbors' territories, and after gratifying his love of adventure with various romantic exploits, and gaining great renown by his ferocious impetuosity in battle, he could end his expedition, perhaps, by adding his neighbors' palaces, and treasures, and wives to his own.

Divine Providence, however, the mysterious power that overrules all the passions and impulses of men, and brings extended and general good out of local and particular evil, has made the ambition and the selfishness of princes the great means of preserving order and government among men. These great ancient despots, for example, would not have been able to collect their revenues, or enlist their armies, or procure supplies for their campaigns, unless their dominions were under a regular and complete system of social organization, such as should allow all the industrial pursuits of commerce and of agriculture, throughout the mass of the community, to go regularly on. Thus absolute monarchs, however ambitious, and selfish, and domineering in their characters, have a strong personal interest in the establishment of order and of justice between man and man throughout all the regions which are under their sway. In fact, the greater their ambition, their selfishness, and their pride, the stronger will this interest be; for, just in proportion as order, industry, and internal tranquillity prevail in a country, just in that proportion can revenues be collected from it, and armies raised and maintained.

It is a mistake, therefore, to suppose of the great heroes, and sovereigns, and conquerors that have appeared from time to time among mankind, that the usual and ordinary result of their influence and action has been that of disturbance and disorganization. It is true that a vast amount of disturbance and disorganization has often followed from the march of their armies, their sieges, their invasions, and the other local and temporary acts of violence which they commit; but these are the exceptions, not the rule. It must be that such things are exceptions, since, in any extended and general view of the subject, a much greater amount of social organization, industry, and peace is necessary to raise and maintain an army, than that army can itself destroy. The deeds of destruction which great conquerors perform attract more attention and make a greater impression upon mankind than the quiet, patient, and long-continued labors by which they perfect and extend the general organization of the social state. But these labors, though less noticed by men, have really employed the energies of great sovereigns in a far greater degree than mankind have generally imagined. Thus we should describe the work of Caesar's life in a single word more truly by saying that he _organized_ Europe, than that he conquered it. His bridges, his roads, his systems of jurisprudence, his coinage, his calendar, and other similar means and instruments of social arrangement, and facilities for promoting the pursuits of industry and peace, mark, far more properly, the real work which that great conqueror performed among mankind, than his battles and his victories. Darius was, in the same way, the organizer of Asia. William the Conqueror completed, or, rather, advanced very far toward completing, the social organization of England; and even in respect to Napoleon, the true and proper memorial of his career is the successful working of the institutions, the systems, and the codes which he perfected and introduced into the social state, and not the brazen column, formed from captured cannon, which stands in the Place Vendome.

These considerations, obviously true, though not always borne in mind, are, however, to be considered as making the characters of the great sovereigns, in a moral point of view, neither the worse nor the better. In all that they did, whether in arranging and systematizing the functions of social life, or in ruthless deeds of conquest and destruction, they were actuated, in a great measure, by selfish ambition. They arranged and organized the social state in order to form a more compact and solid pedestal for the

foundation of their power. They maintained peace and order among their people, just as a master would suppress quarrels among his slaves, because peace among laborers is essential to productive results. They fixed and defined legal rights, and established courts to determine and enforce them; they protected property; they counted and classified men; they opened roads; they built bridges; they encouraged commerce; they hung robbers, and exterminated pirates--all, that the collection of their revenues and the enlistment of their armies might go on without hinderance or restriction. Many of them, indeed, may have been animated, in some degree, by a higher and nobler sentiment than this. Some may have felt a sort of pride in the contemplation of a great, and prosperous, and wealthy empire, analogous to that which a proprietor feels in surveying a well-conditioned, successful, and productive estate. Others, like Alfred, may have felt a sincere and honest interest in the welfare of their fellow-men, and the promotion of human happiness may have been, in a greater or less degree, the direct object of their aim. Still, it can not be denied that a selfish and reckless ambition has been, in general, the main spring of action with heroes and conquerors, which, while it aimed only at personal aggrandizement, has been made to operate, through the peculiar mechanism of the social state which the Divine wisdom has contrived, as a means, in the main of preserving and extending peace and order among mankind, and not of destroying them.

But to return to Atossa. Her father Cyrus, who laid the foundation of the great Persian empire, was, for a hero and conqueror, tolerably considerate and just, and he desired, probably, to promote the welfare and happiness of his millions of subjects; but his son Cambyses, Atossa's brother, having been brought up in expectation of succeeding to vast wealth and power, and having been, as the sons of the wealthy and the powerful often are in all ages of the world, wholly neglected by his father during the early part of his life, and entirely unaccustomed to control, became a wild, reckless, proud, selfish, and ungovernable young man. His father was killed suddenly in battle, as has already been stated, and Cambyses succeeded him. Cambyses's career was short, desperate, and most tragical in its end.[A] In fact, he was one of the most savage, reckless, and abominable monsters that have ever lived.

[Footnote A: His history in given in the first chapter of DARIUS THE GREAT.]

It was the custom in those days for the Persian monarchs to have many wives, and, what is still more remarkable, whenever any monarch died, his successor inherited his predecessor's family as well as his throne. Cyrus had several children by his various wives. Cambyses and Smerdis were the only sons, but there were daughters, among whom Atossa was the most distinguished. The ladies of the court were accustomed to reside in different palaces, or in different suites of apartments in the same palace, so that they lived in a great measure isolated from each other. When Cambyses came to the throne, and thus entered into possession of his father's palaces, he saw and fell in love with one of his father's daughters. He wished to make her one of his wives. He was accustomed to the unrestricted indulgence of every appetite and passion, but he seems to have had some slight misgivings in regard to such a step as this. He consulted the Persian judges. They conferred upon the subject, and then replied that they had searched among the laws of the realm, and though they found no law allowing a man to marry his sister, they found many which authorized a Persian king to do whatever he pleased.

Cambyses therefore added the princess to the number of his wives, and not long afterward he married another of his father's daughters in the same way. One of these princesses was Atossa.

Cambyses invaded Egypt, and in the course of his mad career in that country he killed his brother Smerdis and one of his sisters, and at length was killed himself. Atossa escaped the dangers of this stormy and terrible reign, and returned safely to Susa after Cambyses's death.

Smerdis, the brother of Cambyses, would have been Cambyses's successor if he had survived him; but he had been privately assassinated by Cambyses's orders, though his death had been kept profoundly secret by those who had perpetrated the deed. There was another Smerdis in Susa, the Persian capital, who was a magian--that is, a sort of priest--in whose hands, as regent, Cambyses had left the government while he was absent on his campaigns. This magian Smerdis accordingly conceived the plan of usurping the throne, as if he were Smerdis the prince, resorting to a great many ingenious and cunning schemes to conceal his deception. Among his other plans, one was to keep himself wholly sequestered from public view, with a few favorites, such, especially, as had not personally known Smerdis the prince. In the same manner he secluded from each other and from himself all who had known Smerdis, in order to prevent their conferring with one another, or communicating to each other any suspicions which they might chance to entertain. Such seclusion, so far as related to the ladies of the royal family, was not unusual after the death of a king, and Smerdis did not deviate from the ordinary custom, except to make the isolation and confinement of the princesses and queens more rigorous and strict than common. By means of this policy he was enabled to go on for some months without detection, living all the while in the greatest luxury and splendor, but at the same time in absolute seclusion, and in

unceasing anxiety and fear.

One chief source of his solicitude was lest he should be detected by means of his _ears_! Some years before, when he was in a comparatively obscure position, he had in some way or other offended his sovereign, and was punished by having his ears cut off. It was necessary, therefore, to keep the marks of this mutilation carefully concealed by means of his hair and his head-dress, and even with these precautions he could never feel perfectly secure.

At last one of the nobles of the court, a sagacious and observing man, suspected the imposture. He had no access to Smerdis himself, but his daughter, whose name was Phaedyma, was one of Smerdis's wives. The nobleman was excluded from all direct intercourse with Smerdis, and even with his daughter; but he contrived to send word to his daughter, inquiring whether her husband was the true Smerdis or not. She replied that she did not know, inasmuch as she had never seen any other Smerdis, if, indeed, there had been another. The nobleman then attempted to communicate with Atossa, but he found it impossible to do so. Atossa had, of course, known her brother well, and was on that very account very closely secluded by the magian. As a last resort, the nobleman sent to his daughter a request that she would watch for an opportunity to feel for her husband's ears while he was asleep. He admitted that this would be a dangerous attempt, but his daughter, he said, ought to be willing to make it, since, if her pretended husband were really an impostor, she ought to take even a stronger interest than others in his detection. Phaedyma was at first afraid to undertake so dangerous a commission; but she at length ventured to do so, and, by passing her hand under his turban one night, while he was sleeping on his couch, she found that the ears were gone.[B]

[Footnote B: For a more particular account of the transaction, and for an engraving illustrating this scene, see the history of Darius.]

The consequence of this discovery was, that a conspiracy was formed to dethrone and destroy the usurper. The plot was successful. Smerdis was killed; his imprisoned queens were set free, and Darius was raised to the throne in his stead.

Atossa now, by that strange principle of succession which has been already alluded to, became the wife of Darius, and she figures frequently and conspicuously in history during his long and splendid reign.

Her name is brought into notice in one case in a remarkable manner, in connection with an expedition which Darius sent on an exploring tour into Greece and Italy. She was herself the means, in fact, of sending the expedition. She was sick; and after suffering secretly and in silence as long as possible--the nature of her complaint being such as to make her unwilling to speak of it to others--she at length determined to consult a Greek physician who had been brought to Persia as a captive, and had acquired great celebrity at Susa by his medical science and skill. The physician said that he would undertake her case on condition that she would promise to grant him a certain request that he would make. She wished to know what it was beforehand, but the physician would not tell her. He said, however, that it was nothing that it would be in any way derogatory to her honor to grant him.

On these conditions Atossa concluded to agree to the physician's proposals. He made her take a solemn oath that, if he cured her of her malady, she would do whatever he required of her, provided that it was consistent with honor and propriety. He then took her case under his charge, prescribed for her and attended her, and in due time she was cured. The physician then told her that what he wished her to do for him was to find some means to persuade Darius to send him home to his native land.

Atossa was faithful in fulfilling her promise. She took a private opportunity, when she was alone with Darius, to propose that he should engage in some plans of foreign conquest. She reminded him of the vastness of the military power which was at his disposal, and of the facility with which, by means of it, he might extend his dominions. She extolled, too, his genius and energy, and endeavored to inspire in his mind some ambitious desires to distinguish himself in the estimation of mankind by bringing his capacities for the performance of great deeds into action.

Darius listened to these suggestions of Atossa with interest and with evident pleasure. He said that he had been forming some such plans himself. He was going to build a bridge across the Hellespont or the Bosporus, to unite Europe and Asia; and he was also going to make an incursion into the country of the Scythians, the people by whom Cyrus, his great predecessor, had been defeated and slain. It would be a great glory for him, he said, to succeed in a conquest in which Cyrus had so totally failed.

But these plans would not answer the purpose which Atossa had in view. She urged her husband, therefore, to postpone his invasion of the Scythians till some future time, and first conquer the Greeks, and annex their territory to his dominions. The Scythians, she said, were savages, and their country not worth the cost of conquering it, while Greece would constitute a noble prize. She urged the invasion of Greece, too, rather than Scythia, as a personal favor to herself, for she had been wanting, she said, some slaves from Greece for a long time--some of the women of Sparta, of Corinth, and of Athens, of whose graces and

accomplishments she had heard so much.

There was something gratifying to the military vanity of Darius in being thus requested to make an incursion to another continent, and undertake the conquest of the mightiest nation of the earth, for the purpose of procuring accomplished waiting-maids to offer as a present to his queen. He became restless and excited while listening to Atossa's proposals, and to the arguments with which she enforced them, and it was obvious that he was very strongly inclined to accede to her views. He finally concluded to send a commission into Greece to explore the country, and to bring back a report on their return; and as he decided to make the Greek physician the guide of the expedition, Atossa gained her end.

A full account of this expedition, and of the various adventures which the party met with on their voyage, is given in our history of Darius. It may be proper to say here, however, that the physician fully succeeded in his plans of making his escape. He pretended, at first, to be unwilling to go, and he made only the most temporary arrangements in respect to the conduct of his affairs while he should be gone, in order to deceive the king in regard to his intentions of not returning. The king, on his part, resorted to some stratagems to ascertain whether the physician was sincere in his professions, but he did not succeed in detecting the artifice, and so the party went away. The physician never returned.

Atossa had four sons. Xerxes was the eldest of them. He was not, however, the eldest of the sons of Darius, as there were other sons, the children of another wife, whom Darius had married before he ascended the throne. The oldest of these children was named Artobazanes. Artobazanes seems to have been a prince of an amiable and virtuous character, and not particularly ambitious and aspiring in his disposition, although, as he was the eldest son of his father, he claimed to be his heir. Atossa did not admit the validity of this claim, but maintained that the oldest of _her_ children was entitled to the inheritance.

It became necessary to decide this question before Darius's death; for Darius, in the prosecution of a war in which he was engaged, formed the design of accompanying his army on an expedition into Greece, and, before doing this, he was bound, according to the laws and usages of the Persian realm, to regulate the succession.

There immediately arose an earnest dispute between the friends and partisans of Artobazanes and Xerxes, each side urging very eagerly the claims of its own candidate. The mother and the friends of Artobazanes maintained that he was the oldest son, and, consequently, the heir. Atossa, on the other hand, contended that Xerxes was the grandson of Cyrus, and that he derived from that circumstance the highest possible hereditary rights to the Persian throne.

This was in some respects true, for Cyrus had been the founder of the empire and the legitimate monarch, while Darius had no hereditary claims. He was originally a noble, of high rank, indeed, but not of the royal line; and he had been designated as Cyrus's successor in a time of revolution, because there was, at that time, no prince of the royal family who could take the inheritance. Those, therefore, who were disposed to insist on the claims of a legitimate hereditary succession, might very plausibly claim that Darius's government had been a regency rather than a reign; that Xerxes, being the oldest son of Atossa, Cyrus's daughter, was the true representative of the royal line; and that, although it might not be expedient to disturb the possession of Darius during his lifetime, yet that, at his death, Xerxes was unquestionably entitled to the throne.

There was obviously a great deal of truth and justice in this reasoning, and yet it was a view of the subject not likely to be very agreeable to Darius, since it seemed to deny the existence of any real and valid title to the sovereignty in him. It assigned the crown, at his death, not to his son as such, but to his predecessor's grandson; for though Xerxes was both the son of Darius and the grandson of Cyrus, it was in the latter capacity that he was regarded as entitled to the crown in the argument referred to above. The doctrine was very gratifying to the pride of Atossa, for it made Xerxes the successor to the crown as her son and heir, and not as the son and heir of her husband. For this very reason it was likely to be not very gratifying to Darius. He hesitated very much in respect to adopting it. Atossa's ascendency over his mind, and her influence generally in the Persian court, was almost overwhelming, and yet Darius was very unwilling to seem, by giving to the oldest grandson of Cyrus the precedence over his own eldest son, to admit that he himself had no legitimate and proper title to the throne.

While things were in this state, a Greek, named Demaratus, arrived at Susa. He was a dethroned prince from Sparta, and had fled from the political storms of his own country to seek refuge in Darius's capital. Demaratus found a way to reconcile Darius's pride as a sovereign with his personal preferences as a husband and a father. He told the king that, according to the principles of hereditary succession which were adopted in Greece, Xerxes was his heir as well as Cyrus's, for he was the oldest son who was born _after his accession_. A son, he said, according to the Greek ideas on the subject, was entitled to inherit only such rank as his father held when the son was born; and that, consequently, none of his children who had been born before his accession could have any

claims to the Persian throne. Artobazanes, in a word, was to be regarded, he said, only as the son of Darius the noble, while Xerxes was the son of Darius the king.

In the end Darius adopted this view, and designated Xerxes as his successor in case he should not return from his distant expedition. He did not return. He did not even live to set out upon it. Perhaps the question of the succession had not been absolutely and finally settled, for it arose again and was discussed anew when the death of Darius occurred. The manner in which it was finally disposed of will be described in the next chapter.

CHAPTER II.

EGYPT AND GREECE.

B.C. 484

Xerxes assumes the crown.--His message to Artobazanes.--Question of the succession again debated.--Advice of Atossa.--Decision of Artabanus.--Unfinished wars of Darius.--Egypt and Greece.--Character of the Egyptians.--Character of the Greeks.--Architecture.--Monuments of Greece.--Egyptian architecture.--Form of Egypt.--Delta of the Nile.--Fertility of Egypt.--No rain in Egypt.--Rising of the Nile.--Preparations for the inundation.--Gradual rise of the water.--Appearance of the country during an inundation.--The three theories.--Objections to the first.--Second and third theories.--Reasons against them.--Ideas of the common people in regard to the inundation.--Story of King Pheron.--His punishment.--Sequel of the story of King Pheron.--Nilometers.--Use of Nilometers.--Enormous structures of Egypt.--Comparative antiquity of various objects.--Great age of the Pyramids.--Egypt a mark for the conqueror.--Its relation to Persia.--Xerxes resolves to subdue Egypt first.--The Jews.--The Egyptians subdued.--Return to Susa.

The arrangements which Darius had made to fix and determine the succession, before his death, did not entirely prevent the question from arising again when his death occurred. Xerxes was on the spot at the time, and at once assumed the royal functions. His brother was absent. Xerxes sent a messenger to Artobazanes[C] informing him of their father's death, and of his intention of assuming the crown. He said, however, that if he did so, he should give his brother the second rank, making him, in all respects, next to himself in office and honor. He sent, moreover, a great many splendid presents to Artobazanes, to evince the friendly regard which he felt for him, and to propitiate his favor.

[Footnote C: Plutarch, who gives an account of these occurrences, varies the orthography of the name. We, however, retain the name as given by Herodotus.]

Artobazanes sent back word to Xerxes that he thanked him for his presents, and that he accepted them with pleasure. He said that he considered himself, nevertheless, as justly entitled to the crown, though he should, in the event of his accession, treat all his brothers, and especially Xerxes, with the utmost consideration and respect.

Soon after these occurrences, Artobazanes came to Media, where Xerxes was, and the question which of them should be the king was agitated anew among the nobles of the court. In the end, a public hearing of the cause was had before Artabanus, a brother of Darius, and, of course, an uncle of the contending princes. The question seems to have been referred to him, either because he held some public office which made it his duty to consider and decide such a question, or else because he had been specially commissioned to act as judge in this particular case. Xerxes was at first quite unwilling to submit his claims to the decision of such a tribunal. The crown was, as he maintained, rightfully his. He thought that the public voice was generally in his favor. Then, besides, he was already in possession of the throne, and by consenting to plead his cause before his uncle, he seemed to be virtually abandoning all this vantage ground, and trusting instead to the mere chance of Artabanus's decision.

Atossa, however, recommended to him to accede to the plan of referring the question to Artabanus. He would consider the subject, she said, with fairness and impartiality, and decide it right. She had no doubt that he would decide it in Xerxes's favor; "and if he does not," she added, "and you lose your cause, you only become the second man in the kingdom instead of the first, and the difference is not so very great, after all."

Atossa may have had some secret intimation how Artabanus would decide.

However this may be, Xerxes at length concluded to submit the question. A solemn court was held, and the case was argued in the presence of all the nobles and great officers of state. A throne was at hand to which the successful competitor was to be conducted

as soon as the decision should be made. Artabanus heard the arguments, and decided in favor of Xerxes. Artobazanes, his brother, acquiesced in the decision with the utmost readiness and good humor. He was the first to bow before the king in token of homage, and conducted him, himself, to the throne.

Xerxes kept his promise faithfully of making his brother the second in his kingdom. He appointed him to a very high command in the army, and Artobazanes, on his part, served the king with great zeal and fidelity, until he was at last killed in battle, in the manner hereafter to be described.

As soon as Xerxes found himself established on his throne, he was called upon to decide immediately a great question, namely, which of two important wars in which his father had been engaged he should first undertake to prosecute, the war in Egypt or the war in Greece.

By referring to the map, the reader will see that, as the Persian empire extended westward to Asia Minor and to the coasts of the Mediterranean Sea, the great countries which bordered upon it in this direction were, on the north Greece, and on the south, Egypt; the one in Europe, and the other in Africa. The Greeks and the Egyptians were both wealthy and powerful, and the countries which they respectively inhabited were fertile and beautiful beyond expression, and yet in all their essential features and characteristics they were extremely dissimilar. Egypt was a long and narrow inland valley. Greece reposed, as it were, in the bosom of the sea, consisting, as it did, of an endless number of islands, promontories, peninsulas, and winding coasts, laved on every side by the blue waters of the Mediterranean. Egypt was a plain, diversified only by the varieties of vegetation, and by the towns and villages, and the enormous monumental structures which had been erected by man. Greece was a picturesque and ever-changing scene of mountains and valleys; of precipitous cliffs, winding beaches, rocky capes, and lofty headlands. The character and genius of the inhabitants of these two countries took their cast, in each case, from the physical conformations of the soil. The Egyptians were a quiet, gentle, and harmless race of tillers of the ground. They spent their lives in pumping water from the river, in the patient, persevering toil of sowing smooth and mellow fields, or in reaping the waving grain. The Greeks drove flocks and herds up and down the declivities of the mountains, or hunted wild beasts in forests and fastnesses. They constructed galleys for navigating the seas; they worked the mines and manufactured metals. They built bridges, citadels, temples, and towns, and sculptured statuary from marble blocks which they chiseled from the strata of the mountains. It is surprising what a difference is made in the genius and character of man by elevations, here and there, of a few thousand feet in the country where his genius and character are formed.

The architectural wonders of Egypt and of Greece were as diverse from each other as the natural features of the soil, and in each case the structures were in keeping and in harmony with the character of the landscape which they respectively adorned. The harmony was, however, that of contrast, and not of correspondence. In Greece, where the landscape itself was grand and sublime, the architect aimed only at beauty. To have aimed at magnitude and grandeur in human structures among the mountains, the cliffs, the cataracts, and the resounding ocean shores of Greece, would have been absurd. The Grecian artists were deterred by their unerring instincts from the attempt. They accordingly built beautiful temples, whose white and symmetrical colonnades adorned the declivities, or crowned the summits of the hills. They sculptured statues, to be placed on pedestals in groves and gardens; they constructed fountains; they raised bridges and aqueducts on long ranges of arches and piers; and the summits of ragged rocks crystallized, as it were, under their hands into towers, battlements, and walls. In Egypt, on the other hand, where the country itself was a level and unvarying plain, the architecture took forms of prodigious magnitude, of lofty elevation, and of vast extent. There were ranges of enormous columns, colossal statues, towering obelisks, and pyramids rising like mountains from the verdure of the plain. Thus, while nature gave to the country its elements of beauty, man completed the landscape by adding to it the grand and the sublime.

The shape and proportions of Egypt would be represented by a green ribbon an inch wide and a yard long, lying upon the ground in a serpentine form; and to complete the model, we might imagine a silver filament passing along the center of the green to denote the Nile. The real valley of verdure, however, is not of uniform breadth, like the ribbon so representing it, but widens as it approaches the sea, as if there had been originally a gulf or estuary there, which the sediment from the river had filled.

In fact, the rich and fertile plain which the alluvial deposits of the Nile have formed, has been protruded for some distance into the sea, and the stream divides itself into three great branches about a hundred miles from its mouth, two outermost of which, with the sea-coast in front, inclose a vast triangle, which was called the Delta, from the Greek letter _delta_, (Greek: D), which is of a triangular form. In ascending the river beyond the Delta, the fertile plain, at first twenty-five or thirty miles wide, grows gradually narrower, as the ranges of barren hills and tracts of sandy deserts on either hand draw nearer and nearer to the river. Thus the country consists of two long lines of rich and fertile intervals, one on each side of the stream. In the time of Xerxes the whole extent

was densely populated, every little elevation of the land being covered with a village or a town. The inhabitants tilled the land, raising upon it vast stores of corn, much of which was floated down the river to its mouth, and taken thence to various countries of Europe and Asia, in merchant ships, over the Mediterranean Sea. Caravans, too, sometimes came across the neighboring deserts to obtain supplies of Egyptian corn. This was done by the sons of Jacob when the crops failed them in the land of Canaan, as related in the sacred Scriptures.

There were two great natural wonders in Egypt in ancient times as now: first, it never rained there, or, at least, so seldom, that rain was regarded as a marvelous phenomenon, interrupting the ordinary course of nature, like an earthquake in England or America. The falling of drops of water out of clouds in the sky was an occurrence so strange, so unaccountable, that the whole population regarded it with astonishment and awe. With the exception of these rare and wonder-exciting instances, there was no rain, no snow, no hail, no clouds in the sky. The sun was always shining, and the heavens were always serene. These meteorological characteristics of the country, resulting, as they do, from permanent natural causes, continue, of course, unchanged to the present day; and the Arabs who live now along the banks of the river, keep their crops, when harvested, in heaps in the open air, and require no roofs to their huts except a light covering of sheaves to protect the inmates from the sun.

The other natural wonder of Egypt was the annual rising of the Nile. About midsummer, the peasantry who lived along the banks would find the river gradually beginning to rise. The stream became more turbid, too, as the bosom of the waters swelled. No cause for this mysterious increase appeared, as the sky remained as blue and serene as before, and the sun, then nearly vertical, continued to shine with even more than its wonted splendor. The inhabitants however, felt no surprise, and asked for no explanation of the phenomenon. It was the common course of nature at that season. They had all witnessed it, year after year, from childhood. They, of course, looked for it when the proper month came round, and, though they would have been amazed if the annual flood had failed, they thought nothing extraordinary of its coming.

When the swelling of the waters and the gradual filling of the channels and low grounds in the neighborhood of the river warned the people that the flood was at hand, they all engaged busily in the work of completing their preparations. The harvests were all gathered from the fields, and the vast stores of fruit and corn which they yielded were piled in roofless granaries, built on every elevated spot of ground, where they would be safe from the approaching inundation. The rise of the water was very gradual and slow. Streams began to flow in all directions over the land. Ponds and lakes, growing every day more and more extended, spread mysteriously over the surface of the meadows; and all the time while this deluge of water was rising to submerge the land, the air continued dry, the sun was sultry, and the sky was without a cloud.

As the flood continued to rise, the proportion of land and water, and the conformation of the irregular and temporary shores which separated them, were changed continually, from day to day. The inhabitants assembled in their villages, which were built on rising grounds, some natural, others artificially formed. The waters rose more and more, until only these crowded islands appeared above its surface--when, at length, the valley presented to the view the spectacle of a vast expanse of water, calm as a summer's sea, brilliant with the reflected rays of a tropical sun, and canopied by a sky, which, displaying its spotless blue by day and its countless stars at night, was always cloudless and serene.

The inundation was at its height in October. After that period the waters gradually subsided, leaving a slimy and very fertilizing deposit all over the lands which they had covered. Though the inhabitants themselves, who had been accustomed to this overflow from infancy, felt no wonder or curiosity about its cause, the philosophers of the day, and travelers from other countries who visited Egypt, made many attempts to seek an explanation of the phenomenon. They had three theories on the subject, which Herodotus mentions and discusses.

The first explanation was, that the rising of the river was occasioned by the prevalence of northerly winds on the Mediterranean at that time of the year, which drove back the waters at the mouth of the river, and so caused the accumulation of the water in the upper parts of the valley. Herodotus thought that this was not a satisfactory explanation; for sometimes, as he said, these northerly winds did not blow, and yet the rising of the river took place none the less when the appointed season came. Besides, there were other rivers similarly situated in respect to the influence of prevailing winds at sea in driving in the waters at their mouths, which were, nevertheless, not subject to inundations like the Nile.

The second theory was, that the Nile took its rise, not, like other rivers, in inland lakes, or among inland mountains, but in some remote and unknown ocean on the other side of the continent, which ocean the advocates of this theory supposed might be subject to some great annual ebb and flow; and from this it might result that at stated periods an unusual tide of waters might be poured

into the channel of the river. This, however, could not be true, for the waters of the inundation were fresh, not salt, which proved that they were not furnished by any ocean.

A third hypothesis was, that the rising of the water was occasioned by the melting of the snows in summer on the mountains from which the sources of the river came. Against this supposition Herodotus found more numerous and more satisfactory reasons even than he had advanced against the others. In the first place the river came from the south--a direction in which the heat increased in intensity with every league, as far as travelers had explored it; and beyond those limits, they supposed that the burning sun made the country uninhabitable. It was preposterous to suppose that there could be snow and ice there. Then, besides, the Nile had been ascended to a great distance, and reports from the natives had been brought down from regions still more remote, and no tidings had ever been brought of ice and snow. It was unreasonable, therefore, to suppose that the inundations could arise from such a cause.

These scientific theories, however, were discussed only among philosophers and learned men. The common people had a much more simple and satisfactory mode of disposing of the subject. They, in their imaginations, invested the beneficent river with a sort of life and personality, and when they saw its waters rising so gently but yet surely, to overflow their whole land, leaving it, as they withdrew again, endued with a new and exuberant fertility, they imagined it a living and acting intelligence, that in the exercise of some mysterious and inscrutable powers, the nature of which was to them unknown, and impelled by a kind and friendly regard for the country and its inhabitants, came annually, of its own accord, to spread over the land the blessings of fertility and abundance. The mysterious stream being viewed in this light, its wonderful powers awakened their veneration and awe, and its boundless beneficence their gratitude.

[Illustration: PHERON DEFYING THE NILE.]

Among the ancient Egyptian legends, there is one relating to a certain King Pheron which strikingly illustrates this feeling. It seems that during one of the inundations, while he was standing with his courtiers and watching the flow of the water, the commotion in the stream was much greater than usual on account of a strong wind which was blowing at that time, and which greatly increased the violence of the whirlpools, and the force and swell of the boiling eddies. There was given, in fact, to the appearance of the river an expression of anger, and Pheron, who was of a proud and haughty character, like most of the Egyptian kings, threw his javelin into one of the wildest of the whirlpools, as a token of his defiance of its rage. He was instantly struck blind!

The sequel of the story is curious, though it has no connection with the personality of the Nile. Pheron remained blind for ten years. At the end of that time it was announced to him, by some supernatural communication, that the period of his punishment had expired, and that his sight might be brought back to him by the employment of a certain designated means of restoration, which was the bathing of his eyes by a strictly virtuous woman. Pheron undertook compliance with the requisition, without any idea that the finding of a virtuous woman would be a difficult task. He first tried his own wife, but her bathing produced no effect. He then tried, one after another, various ladies of his court, and afterward others of different rank and station, selecting those who were most distinguished for the excellence of their characters. He was disappointed, however, in them all. The blindness continued unchanged. At last, however, he found the wife of a peasant, whose bathing produced the effect. The monarch's sight was suddenly restored. The king rewarded the peasant woman, whose virtuous character was established by this indisputable test, with the highest honors. The others he collected together, and then shut them up in one of his towns. When they were all thus safely imprisoned, he set the town on fire, and burned them all up together.

To return to the Nile. Certain columns were erected in different parts of the valley, on which cubits and the subdivisions of cubits were marked and numbered, for the purpose of ascertaining precisely the rise of the water. Such a column was called a Nilometer. There was one near Memphis, which was at the upper point of the Delta, and others further up the river. Such pillars continue to be used to mark the height of the inundations to the present day.

The object of thus accurately ascertaining the rise of the water was not mere curiosity, for there were certain important business operations which depended upon the results. The fertility and productiveness of the soil each year were determined almost wholly by the extent of the inundation; and as the ability of the people to pay tribute depended upon their crops, the Nilometer furnished the government with a criterion by which they regulated the annual assessments of the taxes. There were certain canals, too, made to convey the water to distant tracts of land, which were opened or kept closed according as the water rose to a higher or lower point. All these things were regulated by the indications of the Nilometer.

Egypt was famed in the days of Xerxes for those enormous structures and ruins of structures whose origin was then, as now, lost in a remote antiquity. Herodotus found the Pyramids standing in his day, and presenting the same spectacle of mysterious and solitary grandeur which they exhibited to Napoleon. He speculated on their origin and their history, just as the philosophers and travelers of our day do. In fact, he knew less and could learn less about them than is known now. It helps to impress our minds with an idea of the extreme antiquity of these and the other architectural wonders of Egypt, to compare them with things which are considered old in the Western world. The ancient and venerable colleges and halls of Oxford and Cambridge are, many of them, two or three hundred years old. There are remains of the old wall of the city of London which has been standing seven hundred years. This is considered a great antiquity. There are, however, Roman ruins in Britain, and in various parts of Europe, more ancient still. They have been standing eighteen hundred years! People look upon these with a species of wonder and awe that they have withstood the destructive influences of time so long. But as to the Pyramids, if we go back _twenty-five hundred_ years, we find travelers visiting and describing them then--monuments as ancient, as venerable, as mysterious and unknown in their eyes, as they appear now in ours. We judge that a mountain is very distant when, after traveling many miles toward it, it seems still as distant as ever. Now, in tracing the history of the pyramids, the obelisks, the gigantic statues, and the vast columnar ruins of the Nile, we may go back twenty-five hundred years, without, apparently, making any progress whatever toward reaching their origin.

Such was Egypt. Isolated as it was from the rest of the world, and full of fertility and riches, it offered a marked and definite object to the ambition of a conqueror. In fact, on account of the peculiar interest which this long and narrow valley of verdure, with its wonderful structures, the strange and anomalous course of nature which prevails in it, and the extraordinary phases which human life, in consequence, exhibits there, has always excited among mankind, heroes and conquerors have generally considered it a peculiarly glorious field for their exploits. Cyrus, the founder of the Persian monarchy, contemplated the subjugation of it. He did not carry his designs into effect, but left them for Cambyses his son. Darius held the country as a dependency during his reign, though, near the close of his life, it revolted. This revolt took place while he was preparing for his grand expedition against Greece, and he was perplexed with the question which of the two undertakings, the subjugation of the Egyptians or the invasion of Greece, he should first engage in. In the midst of this uncertainty he suddenly died, leaving both the wars themselves and the perplexity of deciding between them as a part of the royal inheritance falling to his son.

Xerxes decided to prosecute the Egyptian campaign first, intending to postpone the conquest of Greece till he had brought the valley of the Nile once more under Persian sway. He deemed it dangerous to leave a province of his father's empire in a state of successful rebellion, while leading his armies off to new undertakings. Mardonius, who was the commander-in-chief of the army, and the great general on whom Xerxes mainly relied for the execution of his schemes, was very reluctant to consent to this plan. He was impatient for the conquest of Greece. There was little glory for him to acquire in merely suppressing a revolt, and reconquering what had been already once subdued. He was eager to enter upon a new field. Xerxes, however, overruled his wishes, and the armies commenced their march for Egypt. They passed the land of Judea on their way, where the captives who had returned from Babylon, and their successors, were rebuilding the cities and reoccupying the country. Xerxes confirmed them in the privileges which Cyrus and Darius had granted them, and aided them in their work. He then went on toward the Nile. The rebellion was easily put down. In less than a year from the time of leaving Susa, he had reconquered the whole land of Egypt, punished the leaders of the revolt, established his brother as viceroy of the country, and returned in safety to Susa.

All this took place in the second year of his reign.

CHAPTER III.

DEBATE ON THE PROPOSED INVASION OF GREECE.

B.C. 481

Counselors of Xerxes.--Age and character of Mardonius.--The avenues to renown.--Blood inherited and blood shed.--Character of Artabanus.--His advice to Xerxes.--The Ionian rebellion.--First invasion of Greece.--Xerxes convenes a public council.--His speech.--Xerxes recounts the aggressions of the Athenians.--Xerxes proposes to build a bridge over the Hellespont.--Excitement of Mardonius.--His speech.--Mardonius expresses his contempt of the Greeks.--Predictions of Mardonius.--Pause in the assembly.--Speech of Artabanus.--His apologies.--Artabanus opposes the war.--Repulse of Datis.--Artabanus warns Xerxes of the danger of the expedition.--Artabanus vindicates the character of the Greeks.--Xerxes's displeasure.--His angry reply to Artabanus.--Xerxes's anxiety.--He determines to abandon his project.--Xerxes sees a vision in the night.--The spirit appears a second time to Xerxes.--Xerxes relates his dreams to Artabanus.--Opinion of the latter.--Artabanus takes Xerxes's place.--The spirit

appears a third time.--Artabanus is convinced.--The invasion decided upon.--Mardonius probably the ghost.

The two great counselors on whose judgment Xerxes mainly relied, so far as he looked to any other judgment than his own in the formation of his plans, were Artabanus, the uncle by whose decision the throne had been awarded to him, and Mardonius, the commander-in-chief of his armies. Xerxes himself was quite a young man, of a proud and lofty, yet generous character, and full of self-confidence and hope. Mardonius was much older, but he was a soldier by profession, and was eager to distinguish himself in some great military campaign. It has always been unfortunate for the peace and happiness of mankind, under all monarchical and despotic governments, in every age of the world, that, through some depraved and unaccountable perversion of public sentiment, those who are not born to greatness have had no means of attaining to it except as heroes in war. Many men have, indeed, by their mental powers or their moral excellences, acquired an extended and lasting _posthumous_ fame; but in respect to all immediate and exalted distinction and honor, it will be found, on reviewing the history of the human race, that there have generally been but two possible avenues to them: on the one hand, high birth, and on the other, the performance of great deeds of carnage and destruction. There must be, it seems, as the only valid claim to renown, either blood inherited or blood shed. The glory of the latter is second, indeed, to that of the former, but it is _only_ second. He who has sacked a city stands very high in the estimation of his fellows. He yields precedence only to him whose grandfather sacked one.

This state of things is now, it is true, rapidly undergoing a change. The age of chivalry, of military murder and robbery, and of the glory of great deeds of carnage and blood, is passing away, and that of peace, of industry, and of achievements for promoting the comfort and happiness of mankind is coming. The men who are now advancing to the notice of the world are those who, through their commerce or their manufactures, feed and clothe their fellow-men by millions, or, by opening new channels or new means for international intercourse, civilize savages, and people deserts; while the glory of killing and destroying is less and less regarded, and more and more readily forgotten.

In the days of Xerxes, however, there was no road to honor but by war, and Mardonius found that his only hope of rising to distinction was by conducting a vast torrent of military devastation over some portion of the globe; and the fairer, the richer, the happier the scene which he was thus to inundate and overwhelm, the greater would be the glory. He was very much disposed, therefore, to urge on the invasion of Greece by every means in his power.

Artabanus, on the other hand, the uncle of Xerxes, was a man advanced in years, and of a calm and cautious disposition. He was better aware than younger men of the vicissitudes and hazards of war, and was much more inclined to restrain than to urge on the youthful ambition of his nephew. Xerxes had been able to present some show of reason for his campaign in Egypt, by calling the resistance which that country offered to his power a rebellion. There was, however, no such reason in the case of Greece. There had been two wars between Persia and the Athenians already, it is true. In the first, the Athenians had aided their countrymen in Asia Minor in a fruitless attempt to recover their independence. This the Persian government considered as aiding and abetting a rebellion. In the second, the Persians under Datis, one of Darius's generals, had undertaken a grand invasion of Greece, and, after landing in the neighborhood of Athens, were beaten, with immense slaughter, at the great battle of Marathon, near that city. The former of these wars is known in history as the Ionian rebellion; the latter as the first Persian invasion of Greece. They had both occurred during the reign of Darius, and the invasion under Datis had taken place not many years before the accession of Xerxes, so that a great number of the officers who had served in that campaign were still remaining in the court and army of Xerxes at Susa. These wars had, however, both been terminated, and Artabanus was very little inclined to have the contests renewed.

Xerxes, however, was bent upon making one more attempt to conquer Greece, and when the time arrived for commencing his preparations, he called a grand council of the generals, the nobles, and the potentates of the realm, to lay his plans before them. The historian who narrated these proceedings recorded the debate that ensued in the following manner.

Xerxes himself first addressed the assembly, to announce and explain his designs.

"The enterprise, my friends," said he, "in which I propose now to engage, and in which I am about to ask your co-operation, is no new scheme of my own devising. What I design to do is, on the other hand, only the carrying forward of the grand course of measures marked out by my predecessors, and pursued by them with steadiness and energy, so long as the power remained in their hands. That power has now descended to me, and with it has devolved the responsibility of finishing the work which they so successfully began.

"It is the manifest destiny of Persia to rule the world. From the time that Cyrus first commenced the work of conquest by subduing Media, to the present day, the extent of our empire has been continually widening, until now it covers all of Asia and Africa, with the

exception of the remote and barbarous tribes, that, like the wild beasts which share their forests with them, are not worth the trouble of subduing. These vast conquests have been made by the courage, the energy, and the military power of Cyrus, Darius, and Cambyses, my renowned predecessors. They, on their part, have subdued Asia and Africa; Europe remains. It devolves on me to finish what they have begun. Had my father lived, he would, himself, have completed the work. He had already made great preparations for the undertaking; but he died, leaving the task to me, and it is plain that I can not hesitate to undertake it without a manifest dereliction of duty.

"You all remember the unprovoked and wanton aggressions which the Athenians committed against us in the time of the Ionian rebellion, taking part against us with rebels and enemies. They crossed the AEgean Sea on that occasion, invaded our territories, and at last captured and burned the city of Sardis, the principal capital of our Western empire. I will never rest until I have had my revenge by burning Athens. Many of you, too, who are here present, remember the fate of the expedition under Datis. Those of you who were attached to that expedition will have no need that I should urge you to seek revenge for your own wrongs. I am sure that you will all second my undertaking with the utmost fidelity and zeal.

"My plan for gaining access to the Grecian territories is not, as before, to convey the troops by a fleet of galleys over the AEgean Sea, but to build a bridge across the Hellespont, and march the army to Greece by land. This course, which I am well convinced is practicable, will be more safe than the other, and the bridging of the Hellespont will be of itself a glorious deed. The Greeks will be utterly unable to resist the enormous force which we shall be able to pour upon them. We can not but conquer; and inasmuch as beyond the Greek territories there is, as I am informed, no other power at all able to cope with us, we shall easily extend our empire on every side to the sea, and thus the Persian dominion will cover the whole habitable world.

"I am sure that I can rely on your cordial and faithful co-operation in these plans, and that each one of you will bring me, from his own province or territories, as large a quota of men, and of supplies for the war, as is in his power. They who contribute thus most liberally I shall consider as entitled to the highest honors and rewards."

Such was, in substance, the address of Xerxes to his council. He concluded by saying that it was not his wish to act in the affair in an arbitrary or absolute manner, and he invited all present to express, with perfect freedom, any opinions or views which they entertained in respect to the enterprise.

While Xerxes had been speaking, the soul of Mardonius had been on fire with excitement and enthusiasm, and every word which the king had uttered only fanned the flame. He rose immediately when the king gave permission to the counselors to speak, and earnestly seconded the monarch's proposals in the following words:

"For my part, sire, I can not refrain from expressing my high admiration of the lofty spirit and purpose on your part, which leads you to propose to us an enterprise so worthy of your illustrious station and exalted personal renown. Your position and power at the present time are higher than those ever attained by any human sovereign that has ever lived; and it is easy to foresee that there is a career of glory before you which no future monarch can ever surpass. You are about to complete the conquest of the world! That exploit can, of course, never be exceeded. We all admire the proud spirit on your part which will not submit tamely to the aggressions and insults which we have received from the Greeks. We have conquered the people of India, of Egypt, of Ethiopia, and of Assyria, and that, too, without having previously suffered any injury from them, but solely from a noble love of dominion; and shall we tamely stop in our career when we see nations opposed to us from whom we have received so many insults, and endured so many wrongs? Every consideration of honor and manliness forbids it.

"We have nothing to fear in respect to the success of the enterprise in which you invite us to engage. I know the Greeks, and I know that they can not stand against our arms. I have encountered them many times and in various ways. I met them in the provinces of Asia Minor, and you all know the result. I met them during the reign of Darius your father, in Macedon and Thrace--or, rather, sought to meet them; for, though I marched through the country, the enemy always avoided me. They could not be found. They have a great name, it is true; but, in fact, all their plans and arrangements are governed by imbecility and folly. They are not ever united among themselves. As they speak one common language, any ordinary prudence and sagacity would lead them to combine together, and make common cause against the nations that surround them. Instead of this, they are divided into a multitude of petty states and kingdoms, and all their resources and power are exhausted in fruitless contentions with each other. I am convinced that, once across the Hellespont, we can march to Athens without finding any enemy to oppose our progress; or, if we should encounter any resisting force, it will be so small and insignificant as to be instantly overwhelmed."

In one point Mardonius was nearly right in his predictions, since it proved subsequently, as will hereafter be seen, that when the Persian army reached the pass of Thermopylae, which was the great avenue of entrance, on the north, into the territories of the Greeks, they found only three hundred men ready there to oppose their passage!

When Mardonius had concluded his speech, he sat down, and quite a solemn pause ensued. The nobles and chieftains generally were less ready than he to encounter the hazards and uncertainties of so distant a campaign. Xerxes would acquire, by the success of the enterprise, a great accession to his wealth and to his dominion, and Mardonius, too, might expect to reap very rich rewards; but what were they themselves to gain? They did not dare, however, to seem to oppose the wishes of the king, and, notwithstanding the invitation which he had given them to speak, they remained silent, not knowing, in fact, exactly what to say.

All this time Artabanus, the venerable uncle of Xerxes, sat silent like the rest, hesitating whether his years, his rank, and the relation which he sustained to the young monarch would justify his interposing, and make it prudent and safe for him to attempt to warn his nephew of the consequences which he would hazard by indulging his dangerous ambition. At length he determined to speak.

"I hope," said he, addressing the king, "that it will not displease you to have other views presented in addition to those which have already been expressed. It is better that all opinions should be heard; the just and the true will then appear the more just and true by comparison with others. It seems to me that the enterprise which you contemplate is full of danger, and should be well considered before it is undertaken. When Darius, your father, conceived of the plan of his invasion of the country of the Scythians beyond the Danube, I counseled him against the attempt. The benefits to be secured by such an undertaking seemed to me wholly insufficient to compensate for the expense, the difficulties, and the dangers of it. My counsels were, however, overruled. Your father proceeded on the enterprise. He crossed the Bosporus, traversed Thrace, and then crossed the Danube; but, after a long and weary contest with the hordes of savages which he found in those trackless wilds, he was forced to abandon the undertaking, and return, with the loss of half his army. The plan which you propose seems to me to be liable to the same dangers, and I fear very much that it will lead to the same results.

"The Greeks have the name of being a valiant and formidable foe. It may prove in the end that they are so. They certainly repulsed Datis and all his forces, vast as they were, and compelled them to retire with an enormous loss. Your invasion, I grant, will be more formidable than his. You will throw a bridge across the Hellespont, so as to take your troops round through the northern parts of Europe into Greece, and you will also, at the same time, have a powerful fleet in the AEgean Sea. But it must be remembered that the naval armaments of the Greeks in all those waters are very formidable. They may attack and destroy your fleet. Suppose that they should do so, and that then, proceeding to the northward in triumph, they should enter the Hellespont and destroy your bridge? Your retreat would be cut off, and, in case of a reverse of fortune, your army would be exposed to total ruin.

"Your father, in fact, very narrowly escaped precisely this fate. The Scythians came to destroy his bridge across the Danube while his forces were still beyond the river, and, had it not been for the very extraordinary fidelity and zeal of Histiaeus, who had been left to guard the post, they would have succeeded in doing it. It is frightful to think that the whole Persian army, with the sovereign of the empire at their head, were placed in a position where their being saved from overwhelming and total destruction depended solely on the fidelity and firmness of a single man! Should you place your forces and your own person in the same danger, can you safely calculate upon the same fortunate escape?

"Even the very vastness of your force may be the means of insuring and accelerating its destruction, since whatever rises to extraordinary elevation and greatness is always exposed to dangers correspondingly extraordinary and great. Thus tall trees and lofty towers seem always specially to invite the thunderbolts of Heaven.

"Mardonius charges the Greeks with a want of sagacity, efficiency, and valor, and speaks contemptuously of them, as soldiers, in every respect. I do not think that such imputations are just to the people against whom they are directed, or honorable to him who makes them. To disparage the absent, especially an absent enemy, is not magnanimous or wise; and I very much fear that it will be found in the end that the conduct of the Greeks will evince very different military qualities from those which Mardonius has assigned them. They are represented by common fame as sagacious, hardy, efficient, and brave, and it may prove that these representations are true.

"My counsel therefore is, that you dismiss this assembly, and take further time to consider this subject before coming to a final decision. Perhaps, on more mature reflection, you will conclude to abandon the project altogether. If you should not conclude to abandon it, but should decide, on the other hand, that it must be prosecuted, let me entreat you not to go yourself in company with the expedition. Let Mardonius take the charge and the responsibility. If he does so, I predict that he will leave the dead bodies of the

soldiers that you intrust to him, to be devoured by dogs on the plains of Athens or Lacedaemon."

Xerxes was exceedingly displeased at hearing such a speech as this from his uncle, and he made a very angry reply. He accused Artabanus of meanness of spirit, and of a cowardice disgraceful to his rank and station, in thus advocating a tame submission to the arrogant pretensions of the Greeks. Were it not, he said, for the respect which he felt for Artabanus, as his father's brother, he would punish him severely for his presumption in thus basely opposing his sovereign's plans. "As it is," continued he, "I will carry my plans into effect, but you shall not have the honor of accompanying me. You shall remain at Susa with the women and children of the palace, and spend your time in the effeminate and ignoble pleasures suited to a spirit so mean. As for myself, I must and will carry my designs into execution. I could not, in fact, long avoid a contest with the Greeks, even if I were to adopt the cowardly and degrading policy which you recommend; for I am confident that they will very soon invade my dominions, if I do not anticipate them by invading theirs."

So saying, Xerxes dismissed the assembly.

His mind, however, was not at ease. Though he had so indignantly rejected the counsel which Artabanus had offered him, yet the impressive words in which it had been uttered, and the arguments with which it had been enforced, weighed upon his spirit, and oppressed and dejected him. The longer he considered the subject, the more serious his doubts and fears became, until at length, as the night approached, he became convinced that Artabanus was right, and that he himself was wrong. His mind found no rest until he came to the determination to abandon the project after all. He resolved to make this change in his resolution known to Artabanus and his nobles in the morning, and to countermand the orders which he had given for the assembling of the troops. Having by this decision restored something like repose to his agitated mind, he laid himself down upon his couch and went to sleep.

In the night he saw a vision. It seemed to him that a resplendent and beautiful form appeared before him, and after regarding him a moment with an earnest look, addressed him as follows:

"And do you really intend to abandon your deliberate design of leading an array into Greece, after having formally announced it to the realm and issued your orders? Such fickleness is absurd, and will greatly dishonor you. Resume your plan, and go on boldly and perseveringly to the execution of it."

So saying, the vision disappeared.

When Xerxes awoke in the morning, and the remembrance of the events of the preceding day returned, mingling itself with the new impressions which had been made by the dream, he was again agitated and perplexed. As, however, the various influences which pressed upon him settled to their final equilibrium, the fears produced by Artabanus's substantial arguments and warnings on the preceding day proved to be of greater weight than the empty appeal to his pride which had been made by the phantom of the night. He resolved to persist in the abandonment of his scheme. He called his council, accordingly, together again, and told them that, on more mature reflection, he had become convinced that his uncle was right and that he himself had been wrong. The project, therefore, was for the present suspended, and the orders for the assembling of the forces were revoked. The announcement was received by the members of the council with the most tumultuous joy.

That night Xerxes had another dream. The same spirit appeared to him again, his countenance, however, bearing now, instead of the friendly look of the preceding night, a new and stern expression of displeasure. Pointing menacingly at the frightened monarch with his finger, he exclaimed, "You have rejected my advice; you have abandoned your plan; and now I declare to you that, unless you immediately resume your enterprise and carry it forward to the end, short as has been the time since you were raised to your present elevation, a still shorter period shall elapse before your downfall and destruction."

The spirit then disappeared as suddenly as it came, leaving Xerxes to awake in an agony of terror.

As soon as it was day, Xerxes sent for Artabanus, and related to him his dreams. "I was willing," said he, "after hearing what you said, and maturely considering the subject, to give up my plan; but these dreams, I can not but think, are intimations from Heaven that I ought to proceed."

Artabanus attempted to combat this idea by representing to Xerxes that dreams were not to be regarded as indications of the will of Heaven, but only as a vague and disordered reproduction of the waking thoughts, while the regular action of the reason and the judgment by which they were ordinarily controlled was suspended or disturbed by the influence of slumber. Xerxes maintained, on the other hand, that, though this view of the case might explain his first vision, the solemn repetition of the warning proved that it

was supernatural and divine. He proposed that, to put the reality of the apparition still further to the test, Artabanus should take his place on the royal couch the next night, to see if the specter would not appear to him. "You shall clothe yourself," said he, "in my robes, put the crown upon your head, and take your seat upon the throne. After that, you shall retire to my apartment, lie down upon the couch, and go to sleep. If the vision is supernatural, it will undoubtedly appear to you. If it does not so appear, I will admit that it was nothing but a dream."

Artabanus made some objection, at first, to the details of the arrangement which Xerxes proposed, as he did not see, he said, of what advantage it could be for him to assume the guise and habiliments of the king. If the vision was divine, it could not be deceived by such artifices as those. Xerxes, however, insisted on his proposition, and Artabanus yielded. He assumed for an hour the dress and the station of the king, and then retired to the king's apartment, and laid himself down upon the couch under the royal pavilion. As he had no faith in the reality of the vision, his mind was quiet and composed, and he soon fell asleep.

At midnight, Xerxes, who was lying in an adjoining apartment, was suddenly aroused by a loud and piercing cry from the room where Artabanus was sleeping, and in a moment afterward Artabanus himself rushed in, perfectly wild with terror. He had seen the vision. It had appeared before him with a countenance and gestures expressive of great displeasure, and after loading him with reproaches for having attempted to keep Xerxes back from his proposed expedition into Greece, it attempted to bore out his eyes with a red-hot iron with which it was armed. Artabanus had barely succeeded in escaping by leaping from his couch and rushing precipitately out of the room.[D]

[Footnote D: See Frontispiece.]

Artabanus said that he was now convinced and satisfied. It was plainly the divine will that Xerxes should undertake his projected invasion, and he would himself, thenceforth, aid the enterprise by every means in his power. The council was, accordingly, once more convened. The story of the three apparitions was related to them, and the final decision announced that the armies were to be assembled for the march without any further delay.

* * * * *

It is proper here to repeat, once for all in this volume, a remark which has elsewhere often been made in the various works of this series, that in studying ancient history at the present day, it is less important now to know, in regard to transactions so remote, what the facts actually were which really occurred, than it is to know the story respecting them, which, for the last two thousand years, has been in circulation among mankind. It is now, for example, of very little consequence whether there ever was or never was such a personage as Hercules, but it is essential that every educated man should know the story which ancient writers tell in relating his doings. In this view of the case, our object, in this volume, is simply to give the history of Xerxes just as it stands, without stopping to separate the false from the true. In relating the occurrences, therefore, which have been described in this chapter, we simply give the alleged facts to our readers precisely as the ancient historians give them to us, leaving each reader to decide for himself how far he will believe the narrative. In respect to this particular story, we will add, that some people think that Mardonius was really the ghost by whose appearance Artabanus and Xerxes were so dreadfully frightened.

CHAPTER IV.

PREPARATIONS FOR THE INVASION OF GREECE.

B.C. 481

Orders to the provinces.--Mode of raising money.--Modern mode of securing supplies of arms and money.--Xerxes's preparations.--Four years allotted to them.--Arms.--Provisions.--Building of ships.--Persian possessions on the north of the AEgean Sea.--Promontory of Mount Athos.--Dangerous navigation.--Plan of Xerxes for the march of his expedition.--Former shipwreck of Mardonius.--Terrible gale.--Destruction of Mardonius's fleet at Mount Athos.--Plan of a canal.--The Greeks do not interfere.--Plans of the engineers.--Prosecution of the work.--The Strymon bridged.--Granaries and store-houses.--Xerxes leaves Susa, and begins his march.--The Meander.--Celaenae.--Pythius.--The wealth of Pythius.--His interview with Xerxes.--The amount of Pythius's wealth.--His offer to Xerxes.--Gratification of Xerxes.--His reply to Pythius's offer.--Real character of Pythius.--The entertainment of silver and gold.--Xerxes's gratitude put to the test.--He murders Pythius's son.--Various objects of interest observed by the army.--The plane-tree.--Artificial honey.--Salt lake.--Gold and silver mines.--Xerxes summons the Greeks to surrender.--They indignantly refuse.

As soon as the invasion of Greece was finally decided upon, the orders were transmitted to all the provinces of the empire, requiring the various authorities and powers to make the necessary preparations. There were men to be levied, arms to be manufactured, ships to be built, and stores of food to be provided. The expenditures, too, of so vast an armament as Xerxes was intending to organize, would require a large supply of money. For all these things Xerxes relied on the revenues and the contributions of the provinces, and orders, very full and very imperative, were transmitted, accordingly, to all the governors and satraps of Asia, and especially to those who ruled over the countries which lay near the western confines of the empire, and consequently near the Greek frontiers.

In modern times it is the practice of powerful nations to accumulate arms and munitions of war on storage in arsenals and naval depots, so that the necessary supplies for very extended operations, whether of attack or defense, can be procured in a very short period of time. In respect to funds, too, modern nations have a great advantage over those of former days, in case of any sudden emergency arising to call for great and unusual expenditures. In consequence of the vast accumulation of capital in the hands of private individuals, and the confidence which is felt in the mercantile honor and good faith of most established governments at the present day, these governments can procure indefinite supplies of gold and silver at any time, by promising to pay an annual interest in lieu of the principal borrowed. It is true that, in these cases, a stipulation is made, by which the government may, at a certain specified period, pay back the principal, and so extinguish the annuity; but in respect to a vast portion of the amount so borrowed, it is not expected that this repayment will ever be made. The creditors, in fact, do not desire that it should be, as owners of property always prefer a safe annual income from it to the custody of the principal; and thus governments in good credit have sometimes induced their creditors to abate the rate of interest which they were receiving, by threatening otherwise to pay the debt in full.

These inventions, however, by which a government in one generation may enjoy the pleasure and reap the glory of waging war, and throw the burden of the expense on another, were not known in ancient times. Xerxes did not understand the art of funding a national debt, and there would, besides, have probably been very little confidence in Persian stocks, if any had been issued. He had to raise all his funds by actual taxation, and to have his arms, and his ships and chariots of war, manufactured express. The food, too, to sustain the immense army which he was to raise, was all to be produced, and store-houses were to be built for the accumulation and custody of it. All this, as might naturally be expected, would require time; and the vastness of the scale on which these immense preparations were made is evinced by the fact that _four years_ were the time allotted for completing them. This period includes, however, a considerable time before the great debate on the subject described in the last chapter.

The chief scene of activity, during all this time, was the tract of country in the western part of Asia Minor, and along the shores of the AEgean Sea. Taxes and contributions were raised from all parts of the empire, but the actual material of war was furnished mainly from those provinces which were nearest to the future scene of it. Each district provided such things as it naturally and most easily produced. One contributed horses, another arms and ammunition, another ships, and another provisions. The ships which were built were of various forms and modes of construction, according to the purposes which they were respectively intended to serve. Some were strictly ships of war, intended for actual combat; others were transports, their destination being simply the conveyance of troops or of military stores. There were also a large number of vessels, which were built on a peculiar model, prescribed by the engineers, being very long and straight-sided, and smooth and flat upon their decks. These were intended for the bridge across the Hellespont. They were made long, so that, when placed side by side across the stream, a greater breadth might be given to the platform of the bridge. All these things were very deliberately and carefully planned.

Although it was generally on the Asiatic side of the AEgean Sea that these vast works of preparation were going on, and the crossing of the Hellespont was to be the first great movement of the Persian army, the reader must not suppose that, even at this time, the European shores were wholly in the hands of the Greeks. The Persians had, long before, conquered Thrace and a part of Macedon; and thus the northern shores of the AEgean Sea, and many of the islands, were already in Xerxes's hands. The Greek dominions lay further south, and Xerxes did not anticipate any opposition from the enemy, until his army, after crossing the strait, should have advanced to the neighborhood of Athens. In fact, all the northern country through which his route would lie was already in his hands, and in passing through it he anticipated no difficulties except such as should arise from the elements themselves, and the physical obstacles of the way. The Hellespont itself was, of course, one principal point of danger. The difficulty here was to be surmounted by the bridge of boats. There was, however, another point, which was, in some respects, still more formidable: it was the promontory of Mount Athos.

By looking at the map of Greece, placed at the commencement of the next chapter, the reader will see that there are two or three singular promontories jutting out from the main land in the northwestern part of the AEgean Sea. The most northerly and the largest

of these was formed by an immense mountainous mass rising out of the water, and connected by a narrow isthmus with the main land. The highest summit of this rocky pile was called Mount Athos in ancient times, and is so marked upon the map. In modern days it is called Monte Santo, or Holy Mountain, being covered with monasteries, and convents, and other ecclesiastical establishments built in the Middle Ages.

Mount Athos is very celebrated in ancient history. It extended along the promontory for many miles, and terminated abruptly in lofty cliffs and precipices toward the sea, where it was so high that its shadow, as was said, was thrown, at sunset, across the water to the island of Lemnos, a distance of twenty leagues. It was a frightful specter in the eyes of the ancient navigators, when, as they came coasting along from the north in their frail galleys, on their voyages to Greece and Italy, they saw it frowning defiance to them as they came, with threatening clouds hanging upon its summit, and the surges and surf of the AEgean perpetually thundering upon its base below. To make this stormy promontory the more terrible, it was believed to be the haunt of innumerable uncouth and misshapen monsters of the sea, that lived by devouring the hapless seamen who were thrown upon the rocks from their wrecked vessels by the merciless tumult of the waves.

The plan which Xerxes had formed for the advance of his expedition was, that the army which was to cross the Hellespont by the bridge should advance thence through Macedonia and Thessaly, by land, attended by a squadron of ships, transports, and galleys, which was to accompany the expedition along the coast by sea. The _men_ could be marched more conveniently to their place of destination by land. The stores, on the other hand, the arms, the supplies, and the baggage of every description, could be transported more easily by sea. Mardonius was somewhat solicitous in respect to the safety of the great squadron which would be required for this latter service, in doubling the promontory of Mount Athos.

In fact, he had special and personal reason for his solicitude, for he had himself, some years before, met with a terrible disaster at this very spot. It was during the reign of Darius that this disaster occurred. On one of the expeditions which Darius had intrusted to his charge, he was conducting a very large fleet along the coast, when a sudden storm arose just as he was approaching this terrible promontory.

He was on the northern side of the promontory when the storm came on, and as the wind was from the north, it blew directly upon the shore. For the fleet to make its escape from the impending danger, it seemed necessary, therefore, to turn the course of the ships back against the wind; but this, on account of the sudden and terrific violence of the gale, it was impossible to do. The sails, when they attempted to use them, were blown away by the howling gusts, and the oars were broken to pieces by the tremendous dashing of the sea. It soon appeared that the only hope of escape for the squadron was to press on in the desperate attempt to double the promontory, and thus gain, if possible, the sheltered water under its lee. The galleys, accordingly, went on, the pilots and the seamen exerting their utmost to keep them away from the shore.

All their efforts, however, to do this, were vain. The merciless gales drove the vessels, one after another, upon the rocks, and dashed them to pieces, while the raging sea wrenched the wretched mariners from the wrecks to which they attempted to cling, and tossed them out into the boiling whirlpools around, to the monsters that were ready there to devour them, as if she were herself some ferocious monster, feeding her offspring with their proper prey. A few, it is true, of the hapless wretches succeeded in extricating themselves from the surf, by crawling up upon the rocks, through the tangled sea-weed, until they were above the reach of the surges; but when they had done so, they found themselves hopelessly imprisoned between the impending precipices which frowned above them and the frantic billows which were raging and roaring below. They gained, of course, by their apparent escape, only a brief prolongation of suffering, for they all soon miserably perished from exhaustion, exposure, and cold.

Mardonius had no desire to encounter this danger again. Now the promontory of Mount Athos, though high and rocky itself, was connected with the main land by an isthmus level and low, and not very broad. Xerxes determined on cutting a canal through this isthmus, so as to take his fleet of galleys across the neck, and thus avoid the stormy navigation of the outward passage. Such a canal would be of service not merely for the passage of the great fleet, but for the constant communication which it would be necessary for Xerxes to maintain with his own dominions during the whole period of the invasion.

It might have been expected that the Greeks would have interfered to prevent the execution of such a work as this; but it seems that they did not, and yet there was a considerable Greek population in that vicinity. The promontory of Athos itself was quite extensive, being about thirty miles long and four or five wide, and it had several towns upon it. The canal which Xerxes was to cut across the neck of this peninsula was to be wide enough for two triremes to pass each other. Triremes were galleys propelled by three banks of oars, and were vessels of the largest class ordinarily employed; and as the oars by which they were impelled

required almost as great a breadth of water as the vessels themselves, the canal was, consequently, to be very wide.

The engineers, accordingly, laid out the ground, and, marking the boundaries by stakes and lines, as guides to the workmen, the excavation was commenced. Immense numbers of men were set at work, arranged regularly in gangs, according to the various nations which furnished them. As the excavation gradually proceeded, and the trench began to grow deep, they placed ladders against the sides, and stationed a series of men upon them; then the earth dug from the bottom was hauled up from one to another, in a sort of basket or hod, until it reached the top, where it was taken by other men and conveyed away.

The work was very much interrupted and impeded, in many parts of the line, by the continual caving in of the banks, on account of the workmen attempting to dig perpendicularly down. In one section--the one which had been assigned to the Phoenicians--this difficulty did not occur; for the Phoenicians, more considerate than the rest, had taken the precaution to make the breadth of their part of the trench twice as great at the top as it was below. By this means the banks on each side were formed to a gradual slope, and consequently stood firm. The canal was at length completed, and the water was let in.

North of the promontory of Mount Athos the reader will find upon the map the River Strymon, flowing south, not far from the boundary between Macedon and Thrace, into the AEgean Sea. The army of Xerxes, in its march from the Hellespont, would, of course, have to cross this river; and Xerxes having, by cutting the canal across the isthmus of Mount Athos, removed an obstacle in the way of his fleet, resolved next to facilitate the progress of his army by bridging the Strymon.

The king also ordered a great number of granaries and store-houses to be built at various points along the route which it was intended that his army should pursue. Some of these were on the coasts of Macedonia and Thrace, and some on the banks of the Strymon. To these magazines the corn raised in Asia for the use of the expedition was conveyed, from time to time, in transport ships, as fast as it was ready, and, being safely deposited, was protected by a guard. No very extraordinary means of defense seems to have been thought necessary at these points, for, although the scene of all these preliminary arrangements was on the European side of the line, and in what was called Greek territory, still this part of the country had been long under Persian dominion. The independent states and cities of Greece were all further south, and the people who inhabited them did not seem disposed to interrupt these preparations. Perhaps they were not aware to what object and end all these formidable movements on their northern frontier were tending.

Xerxes, during all this time, had remained in Persia. The period at length arrived when, his preparations on the frontiers being far advanced toward completion, he concluded to move forward at the head of his forces to Sardis. Sardis was the great capital of the western part of his dominions, and was situated not far from the frontier. He accordingly assembled his forces, and, taking leave of his capital of Susa with much parade and many ceremonies, he advanced toward Asia Minor. Entering and traversing Asia Minor, he crossed the Halys, which had been, in former times, the western boundary of the empire, though its limits had now been extended very far beyond. Having crossed the Halys, the immense procession advanced into Phrygia.

A very romantic tale is told of an interview between Xerxes and a certain nobleman named Pythius, who resided in one of the Phrygian towns. The circumstances were these: After crossing the Halys, which river flows north into the Euxine Sea, the army went on to the westward through nearly the whole extent of Phrygia, until at length they came to the sources of the streams which flowed west into the AEgean Sea. One of the most remarkable of these rivers was the Meander. There was a town built exactly at the source of the Meander--so exactly, in fact, that the fountain from which the stream took its rise was situated in the public square of the town, walled in and ornamented like an artificial fountain in a modern city. The name of this town was Celaenae.

When the army reached Celaenae and encamped there, Pythius made a great entertainment for the officers, which, as the number was very large, was of course attended with an enormous expense. Not satisfied with this, Pythius sent word to the king that if he was, in any respect, in want of funds for his approaching campaign, he, Pythius, would take great pleasure in supplying him.

Xerxes was surprised at such proofs of wealth and munificence from a man in comparatively a private station. He inquired of his attendants who Pythius was. They replied that, next to Xerxes himself, he was the richest man in the world. They said, moreover, that he was as generous as he was rich. He had made Darius a present of a beautiful model of a fruit-tree and of a vine, of solid gold. He was by birth, they added, a Lydian.

Lydia was west of Phrygia, and was famous for its wealth. The River Pactolus, which was so celebrated for its golden sands, flowed through the country, and as the princes and nobles contrived to monopolize the treasures which were found, both in the river itself and in the mountains from which it flowed, some of them became immensely wealthy.

Xerxes was astonished at the accounts which he heard of Pythius's fortune. He sent for him, and asked him what was the amount of his treasures. This was rather an ominous question; for, under such despotic governments as those of the Persian kings, the only real safeguard of wealth was, often, the concealment of it. Inquiry on the part of a government, in respect to treasures accumulated by a subject, was, often, only a preliminary to the seizure and confiscation of them.

Pythius, however, in reply to the king's question, said that he had no hesitation in giving his majesty full information in respect to his fortune. He had been making, he said, a careful calculation of the amount of it, with a view of determining how much he could offer to contribute in aid of the Persian campaign. He found, he said, that he had two thousand talents of silver, and four millions, wanting seven thousand, of _staters_ of gold.

The stater was a Persian coin. Even if we knew, at the present day, its exact value, we could not determine the precise amount denoted by the sum which Pythius named, the value of money being subject to such vast fluctuations in different ages of the world. Scholars who have taken an interest in inquiring into such points as these, have come to the conclusion that the amount of gold and silver coin which Pythius thus reported to Xerxes was equal to about thirty millions of dollars.

Pythius added, after stating the amount of the gold and silver which he had at command, that it was all at the service of the king for the purpose of carrying on the war. He had, he said, besides his money, slaves and farms enough for his own maintenance.

Xerxes was extremely gratified at this generosity, and at the proof which it afforded of the interest which Pythius felt in the cause of the king. "You are the only man," said he, "who has offered hospitality to me or to my army since I set out upon this march, and, in addition to your hospitality, you tender me your whole fortune. I will not, however, deprive you of your treasure. I will, on the contrary, order my treasurer to pay to you the seven thousand staters necessary to make your four millions complete. I offer you also my friendship, and will do any thing in my power, now and hereafter, to serve you. Continue to live in the enjoyment of your fortune. If you always act under the influence of the noble and generous impulses which govern you now, you will never cease to be prosperous and happy."

If we could end the account of Pythius and Xerxes here, what generous and noble-minded men we might suppose them to be! But alas! how large a portion of the apparent generosity and nobleness which shows itself among potentates and kings, turns into selfishness and hypocrisy when closely examined. Pythius was one of the most merciless tyrants that ever lived. He held all the people that lived upon his vast estates in a condition of abject slavery, compelling them to toil continually in his mines, in destitution and wretchedness, in order to add more and more to his treasures. The people came to his wife with their bitter complaints. She pitied them, but could not relieve them. One day, it is said that, in order to show her husband the vanity and folly of living only to amass silver and gold, and to convince him how little real power such treasures have to satisfy the wants of the human soul, she made him a great entertainment, in which there was a boundless profusion of wealth in the way of vessels and furniture of silver and gold, but scarcely any food. There was every thing to satisfy the eye with the sight of magnificence, but nothing to satisfy hunger. The noble guest sat starving in the midst of a scene of unexampled riches and splendor, because it was not possible to _eat_ silver and gold.

And as for Xerxes's professions of gratitude and friendship for Pythius, they were put to the test, a short time after the transactions which we have above described, in a remarkable manner. Pythius had five sons. They were all in Xerxes's army. By their departure on the distant and dangerous expedition on which Xerxes was to lead them, their father would be left alone. Pythius, under these circumstances, resolved to venture so far on the sincerity of his sovereign's professions of regard as to request permission to retain one of his sons at home with his father, on condition of freely giving up the rest.

Xerxes, on hearing this proposal, was greatly enraged. "How dare you," said he, "come to me with such a demand? You and all that pertain to you are my slaves, and are bound to do my bidding without a murmur. You deserve the severest punishment for such an insolent request. In consideration, however, of your past good behavior, I will not inflict upon you what you deserve. I will only kill one of your sons--the one that you seem to cling to so fondly. I will spare the rest." So saying, the enraged king ordered the son whom Pythius had endeavored to retain to be slain before his eyes, and then directed that the dead body should be split in two, and the two halves thrown, the one on the right side of the road and the other on the left, that his army, as he said, might "march between them."

On leaving Phrygia, the army moved on toward the west. Their immediate destination as has already been said, was Sardis, where they were to remain until the ensuing spring. The historian mentions a number of objects of interest which attracted the attention of Xerxes and his officers on this march, which mark the geographical peculiarities of the country, or illustrate, in some degree, the

ideas and manners of the times.

There was one town, for example, situated, not like Celaenae, where a river had its origin, but where one disappeared. The stream was a branch of the Meander. It came down from the mountains like any other mountain torrent, and then, at the town in question, it plunged suddenly down into a gulf or chasm and disappeared. It rose again at a considerable distance below, and thence flowed on, without any further evasions, to the Meander.

On the confines between Phrygia and Lydia the army came to a place where the road divided. One branch turned toward the north, and led to Lydia; the other inclined to the south, and conducted to Caria. Here, too, on the frontier, was a monument which had been erected by Croesus, the great king of Lydia, who lived in Cyrus's day, to mark the eastern boundaries of his kingdom. The Persians were, of course, much interested in looking upon this ancient landmark, which designated not only the eastern limit of Croesus's empire, but also what was, in ancient times, the western limit of their own.

There was a certain species of tree which grew in these countries called the plane-tree. Xerxes found one of these trees so large and beautiful that it attracted his special admiration. He took possession of it in his own name, and adorned it with golden chains, and set a guard over it. This idolization of a tree was a striking instance of the childish caprice and folly by which the actions of the ancient despots were so often governed.

As the army advanced, they came to other places of interest and objects of curiosity and wonder. There was a district where the people made a sort of artificial honey from grain, and a lake from which the inhabitants procured salt by evaporation, and mines, too, of silver and of gold. These objects interested and amused the minds of the Persians as they moved along, without, however, at all retarding or interrupting their progress. In due time they reached the great city of Sardis in safety, and here Xerxes established his head-quarters, and awaited the coming of spring.

In the mean time, however, he sent heralds into Greece to summon the country to surrender to him. This is a common formality when an army is about to attack either a town, a castle, or a kingdom. Xerxes's heralds crossed the AEgean Sea, and made their demands, in Xerxes's name, upon the Greek authorities. As might have been expected, the embassage was fruitless; and the heralds returned, bringing with them, from the Greeks, not acts or proffers of submission, but stern expressions of hostility and defiance. Nothing, of course, now remained, but that both parties should prepare for the impending crisis.

CHAPTER V.

CROSSING THE HELLESPONT.

B.C. 480

Winter in Asia Minor.--Destruction of the bridge.--Indignation of Xerxes.--His ridiculous punishment of the sea.--Xerxes orders a new bridge to be made.--Its construction.--Mode of securing the boats.--The bridge finished.--Eclipse of the sun.--March from Sardis.--Order of march.--Car of Jupiter.--Chariot of Xerxes.--Camp followers.--Arrival at the plain of Troy.--The grand sacrifice.--Dejection of the army.--Mode of enlistment.--Condition of the soldiers.--Privations and hardships.--Storm on Mount Ida.--Abydos.--Parade of the troops.--Xerxes weeps.--The reason of it.--Comments of writers.--Remarks of Artabanus.--Conversation with Artabanus.--He renews his warnings.--Anxiety of Artabanus.--Xerxes is not convinced.--Advice of Artabanus in respect to employing the Ionians.--Xerxes's opinion of the Ionians.--Artabanus is permitted to return.--Sham sea fight.--Xerxes's address.--Crossing the bridge.--Preliminary ceremonies.--The order of march.--Movement of the fleet.--Time occupied in the passage.--Scene of confusion.

Although the ancient Asia Minor was in the same latitude as New York, there was yet very little winter there. Snows fell, indeed, upon the summits of the mountains, and ice formed occasionally upon quiet streams, and yet, in general, the imaginations of the inhabitants, in forming mental images of frost and snow, sought them not in their own winters, but in the cold and icy regions of the north, of which, however, scarcely any thing was known to them except what was disclosed by wild and exaggerated rumors and legends.

[Illustration: MAP OF GREECE.]

There was, however, a period of blustering winds and chilly rains which was called winter, and Xerxes was compelled to wait, before commencing his invasion, until the inclement season had passed. As it was, he did not wholly escape the disastrous effects

of the wintery gales. A violent storm arose while he was at Sardis, and broke up the bridge which he had built across the Hellespont. When the tidings of this disaster were brought to Xerxes at his winter quarters, he was very much enraged. He was angry both with the sea for having destroyed the structure, and with the architects who had built it for not having made it strong enough to stand against its fury. He determined to punish both the waves and the workmen. He ordered the sea to be scourged with a monstrous whip, and directed that heavy chains should be thrown into it, as symbols of his defiance of its power, and of his determination to subject it to his control. The men who administered this senseless discipline cried out to the sea, as they did it, in the following words, which Xerxes had dictated to them: "Miserable monster! this is the punishment which Xerxes your master inflicts upon you, on account of the unprovoked and wanton injury you have done him. Be assured that he will pass over you, whether you will or no. He hates and defies you, object as you are, through your insatiable cruelty, and the nauseous bitterness of your waters, of the common abomination of mankind."

As for the men who had built the bridge, which had been found thus inadequate to withstand the force of a wintery tempest, he ordered every one of them to be beheaded.

The vengeance of the king being thus satisfied, a new set of engineers and workmen were designated and ordered to build another bridge. Knowing, as, of course, they now did, that their lives depended upon the stability of their structure, they omitted no possible precaution which could tend to secure it. They selected the strongest ships, and arranged them in positions which would best enable them to withstand the pressure of the current. Each vessel was secured in its place by strong anchors, placed scientifically in such a manner as to resist, to the best advantage, the force of the strain to which they would be exposed. There were two ranges of these vessels, extending from shore to shore, containing over three hundred in each. In each range one or two vessels were omitted, on the Asiatic side, to allow boats and galleys to pass through, in order to keep the communication open. These omissions did not interfere with the use of the bridge, as the superstructure and the roadway above was continued over them.

The vessels which were to serve for the foundation of the bridge being thus arranged and secured in their places, two immense cables were made and stretched from shore to shore, each being fastened, at the ends, securely to the banks, and resting in the middle on the decks of the vessels. For the fastenings of these cables on the shore there were immense piles driven into the ground, and huge rings attached to the piles. The cables, as they passed along the decks of the vessels over the water, were secured to them all by strong cordage, so that each vessel was firmly and indissolubly bound to all the rest.

Over these cables a platform was made of trunks of trees, with branches placed upon them to fill the interstices and level the surface. The whole was then covered with a thick stratum of earth, which made a firm and substantial road like that of a public highway. A high and close fence was also erected on each side, so as to shut off the view of the water, which might otherwise alarm the horses and the beasts of burden that were to cross with the army.

When the news was brought to Xerxes at Sardis that the bridge was completed, and that all things were ready for the passage, he made arrangements for commencing his march. A circumstance, however, here occurred that at first alarmed him. It was no less a phenomenon than an eclipse of the sun. Eclipses were considered in those days as extraordinary and supernatural omens, and Xerxes was naturally anxious to know what this sudden darkness was meant to portend. He directed the magi to consider the subject, and to give him their opinion. Their answer was, that, as the sun was the guardian divinity of the Greeks, and the moon that of the Persians, the meaning of the sudden withdrawal of the light of day doubtless was, that Heaven was about to withhold its protection from the Greeks in the approaching struggle. Xerxes was satisfied with this explanation, and the preparations for the march went on.

The movement of the grand procession from the city of Sardis was inconceivably splendid. First came the long trains of baggage, on mules, and camels, and horses, and other beasts of burden, attended by the drivers, and the men who had the baggage in charge. Next came an immense body of troops of all nations, marching irregularly, but under the command of the proper officers. Then, after a considerable interval, came a body of a thousand horse, splendidly caparisoned, and followed by a thousand spearmen, who marched trailing their spears upon the ground, in token of respect and submission to the king who was coming behind them.

Next to these troops, and immediately in advance of the king, were certain religious and sacred objects and personages, on which the people who gazed upon this gorgeous spectacle looked with the utmost awe and veneration. There were, first, ten sacred horses, splendidly caparisoned, each led by his groom, who was clothed in appropriate robes, as a sort of priest officiating in the service of a god. Behind these came the sacred car of Jupiter. This car was very large, and elaborately worked, and was profusely

ornamented with gold. It was drawn by eight white horses. No human being was allowed to set his foot upon any part of it, and, consequently, the reins of the horses were carried back, under the car, to the charioteer, who walked behind. Xerxes's own chariot came next, drawn by very splendid horses, selected especially for their size and beauty. His charioteer, a young Persian noble, sat by his side.

Then came great bodies of troops. There was one corps of two thousand men, the life-guards of the king, who were armed in a very splendid and costly manner, to designate their high rank in the army, and the exalted nature of their duty as personal attendants on the sovereign. One thousand of these life-guards were foot soldiers, and the other thousand horsemen. After the life-guards came a body of ten thousand infantry, and after them ten thousand cavalry. This completed what was strictly the Persian part of the army. There was an interval of about a quarter of a mile in the rear of these bodies of troops, and then came a vast and countless multitude of servants, attendants, adventurers, and camp followers of every description--a confused, promiscuous, disorderly, and noisy throng.

The immediate destination of this vast horde was Abydos; for it was between Sestos, on the European shore, and Abydos, on the Asiatic, that the bridge had been built. To reach Abydos, the route was north, through the province of Mysia. In their progress the guides of the army kept well inland, so as to avoid the indentations of the coast, and the various small rivers which here flow westward toward the sea. Thus advancing, the army passed to the right of Mount Ida, and arrived at last on the bank of the Scamander. Here they encamped. They were upon the plain of Troy.

The world was filled, in those days, with the glory of the military exploits which had been performed, some ages before, in the siege and capture of Troy; and it was the custom for every military hero who passed the site of the city to pause in his march and spend some time amid the scenes of those ancient conflicts, that he might inspirit and invigorate his own ambition by the associations of the spot, and also render suitable honors to the memories of those that fell there. Xerxes did this. Alexander subsequently did it. Xerxes examined the various localities, ascended the ruins of the citadel of Priam, walked over the ancient battle fields, and at length, when his curiosity had thus been satisfied, he ordered a grand sacrifice of a thousand oxen to be made, and a libation of corresponding magnitude to be offered, in honor of the shades of the dead heroes whose deeds had consecrated the spot.

Whatever excitement and exhilaration, however, Xerxes himself may have felt, in approaching, under these circumstances, the transit of the stream, where the real labors and dangers of his expedition were to commence, his miserable and helpless soldiers did not share them. Their condition and prospects were wretched in the extreme. In the first place, none of them went willingly. In modern times, at least in England and America, armies are recruited by enticing the depraved and the miserable to enlist, by tendering them a bounty, as it is called, that is, a sum of ready money, which, as a means of temporary and often vicious pleasure, presents a temptation they can not resist. The act of enlistment is, however, in a sense voluntary, so that those who have homes, and friends, and useful pursuits in which they are peacefully engaged, are not disturbed. It was not so with the soldiers of Xerxes. They were slaves, and had been torn from their rural homes all over the empire by a merciless conscription, from which there was no possible escape. Their life in camp, too, was comfortless and wretched. At the present day, when it is so much more difficult than it then was to obtain soldiers, and when so much more time and attention are required to train them to their work in the modern art of war, soldiers must be taken care of when obtained; but in Xerxes's day it was much easier to get new supplies of recruits than to incur any great expense in providing for the health and comfort of those already in the service. The arms and trappings, it is true, of such troops as were in immediate attendance on the king, were very splendid and gay, though this was only decoration, after all, and the king's decoration too, not theirs. In respect, however, to every thing like personal comfort, whether of food and of clothing, or the means of shelter and repose, the common soldiers were utterly destitute and wretched. They felt no interest in the campaign; they had nothing to hope for from its success, but a continuance, if their lives were spared, of the same miserable bondage which they had always endured. There was, however, little probability even of this; for whether, in the case of such an invasion, the aggressor was to succeed or to fail, the destiny of the soldiers personally was almost inevitable destruction. The mass of Xerxes's army was thus a mere herd of slaves, driven along by the whips of their officers, reluctant, wretched, and despairing.

This helpless mass was overtaken one night, among the gloomy and rugged defiles and passes of Mount Ida, by a dreadful storm of wind and rain, accompanied by thunder and lightning. Unprovided as they were with the means of protection against such tempests, they were thrown into confusion, and spent the night in terror. Great numbers perished, struck by the lightning, or exhausted by the cold and exposure; and afterward, when they encamped on the plains of Troy, near the Scamander, the whole of the water of the stream was not enough to supply the wants of the soldiers and the immense herds of beasts of burden, so that many thousands suffered severely from thirst.

All these things conspired greatly to depress the spirits of the men, so that, at last, when they arrived in the vicinity of Abydos, the whole army was in a state of extreme dejection and despair. This, however, was of little consequence. The repose of a master so despotic and lofty as Xerxes is very little disturbed by the mental sorrows of his slaves. Xerxes reached Abydos, and prepared to make the passage of the strait in a manner worthy of the grandeur of the occasion.

The first thing was to make arrangements for a great parade of his forces, not, apparently, for the purpose of accomplishing any useful end of military organization in the arrangement of the troops, but to gratify the pride and pleasure of the sovereign with an opportunity of surveying them. A great white throne of marble was accordingly erected on an eminence not far from the shore of the Hellespont, from which Xerxes looked down with great complacency and pleasure, on the one hand, upon the long lines of troops, the countless squadrons of horsemen, the ranges of tents, and the vast herds of beasts of burden which were assembled on the land, and, on the other hand, upon the fleets of ships, and boats, and galleys at anchor upon the sea; while the shores of Europe were smiling in the distance, and the long and magnificent roadway which he had made lay floating upon the water, all ready to take his enormous armament across whenever he should issue the command.

Any deep emotion of the human soul, in persons of a sensitive physical organization, tends to tears; and Xerxes's heart, being filled with exultation and pride, and with a sense of inexpressible grandeur and sublimity as he looked upon this scene, was softened by the pleasurable excitements of the hour, and though, at first his countenance was beaming with satisfaction and pleasure, his uncle Artabanus, who stood by his side, soon perceived that tears were standing in his eyes. Artabanus asked him what this meant. It made him sad, Xerxes replied, to reflect that, immensely vast as the countless multitude before him was, in one hundred years from that time not one of them all would be alive.

The tender-heartedness which Xerxes manifested on this occasion, taken in connection with the stern and unrelenting tyranny which he was exercising over the mighty mass of humanity whose mortality he mourned, has drawn forth a great variety of comments from writers of every age who have repeated the story. Artabanus replied to it on the spot by saying that he did not think that the king ought to give himself too much uneasiness on the subject of human liability to death, for it happened, in a vast number of cases, that the privations and sufferings of men were so great, that often, in the course of their lives, they rather wished to die than to live; and that death was, consequently, in some respects, to be regarded, not as in itself a woe, but rather as the relief and remedy for woe.

There is no doubt that this theory of Artabanus, so far as it applied to the unhappy soldiers of Xerxes, all marshaled before him when he uttered it, was eminently true.

Xerxes admitted that what his uncle said was just, but it was, he said, a melancholy subject, and so he changed the conversation. He asked his uncle whether he still entertained the same doubts and fears in respect to the expedition that he had expressed at Susa when the plan was first proposed in the council. Artabanus replied that he most sincerely hoped that the prognostications of the vision would prove true, but that he had still great apprehensions of the result. "I have been reflecting," continued he, "with great care on the whole subject, and it seems to me that there are two dangers of very serious character to which your expedition will be imminently exposed."

Xerxes wished to know what they were.

"They both arise," said Artabanus, "from the immense magnitude of your operations. In the first place, you have so large a number of ships, galleys, and transports in your fleet, that I do not see how, when you have gone down upon the Greek coast, if a storm should arise, you are going to find shelter for them. There are no harbors there large enough to afford anchorage ground for such an immense number of vessels."

"And what is the other danger?" asked Xerxes.

"The other is the difficulty of finding food for such a vast multitude of _men_ as you have brought together in your armies. The quantity of food necessary to supply such countless numbers is almost incalculable. Your granaries and magazines will soon be exhausted, and then, as no country whatever that you can pass through will have resources of food adequate for such a multitude of mouths, it seems to me that your march must inevitably end in a famine. The less resistance you meet with, and the further you consequently advance, the worse it will be for you. I do not see how this fatal result can possibly be avoided; and so uneasy and anxious am I on the subject, that I have no rest or peace."

"I admit," said Xerxes, in reply, "that what you say is not wholly unreasonable; but in great undertakings it will never do to take counsel wholly of our fears. I am willing to submit to a very large portion of the evils to which I expose myself on this expedition, rather than not accomplish the end which I have in view. Besides, the most prudent and cautious counsels are not always the best. He who hazards nothing gains nothing. I have always observed that in all the affairs of human life, those who exhibit some enterprise and courage in what they undertake are far more likely to be successful than those who weigh every thing and consider every thing, and will not advance where they can see any remote prospect of danger. If my predecessors had acted on the principles which you recommend, the Persian empire would never have acquired the greatness to which it has now attained. In continuing to act on the same principles which governed them, I confidently expect the same success. We shall conquer Europe, and then return in peace, I feel assured, without encountering the famine which you dread so much, or any other great calamity."

On hearing these words, and observing how fixed and settled the determinations of Xerxes were, Artabanus said no more on the general subject, but on one point he ventured to offer his counsel to his nephew, and that was on the subject of employing the Ionians in the war. The Ionians were Greeks by descent. Their ancestors had crossed the AEgean Sea, and settled at various places along the coast of Asia Minor, in the western part of the provinces of Caria, Lydia, and Mysia. Artabanus thought it was dangerous to take these men to fight against their countrymen. However faithfully disposed they might be in commencing the enterprise, a thousand circumstances might occur to shake their fidelity and lead them to revolt, when they found themselves in the land of their forefathers, and heard the enemies against whom they had been brought to contend speaking their own mother tongue.

Xerxes, however, was not convinced by Artabanus's arguments. He thought that the employment of the Ionians was perfectly safe. They had been eminently faithful and firm, he said, under Histiaeus, in the time of Darius's invasion of Scythia, when Darius had left them to guard his bridge over the Danube. They had proved themselves trustworthy then, and he would, he said, accordingly trust them now. "Besides," he added, "they have left their property, their wives and their children, and all else that they hold dear, in our hands in Asia, and they will not dare, while we retain such hostages, to do any thing against us."

Xerxes said, however, that since Artabanus was so much concerned in respect to the result of the expedition, he should not be compelled to accompany it any further, but that he might return to Susa instead, and take charge of the government there until Xerxes should return.

A part of the celebration on the great day of parade, on which this conversation between the king and his uncle was held, consisted of a naval sea fight, waged on the Hellespont, between two of the nations of his army, for the king's amusement. The Phoenicians were the victors in this combat. Xerxes was greatly delighted with the combat, and, in fact, with the whole of the magnificent spectacle which the day had displayed.

Soon after this, Xerxes dismissed Artabanus, ordering him to return to Susa, and to assume the regency of the empire. He convened, also, another general council of the nobles of his court and the officers of the army, to announce to them that the time had arrived for crossing the bridge, and to make his farewell address to them before they should take their final departure from Asia. He exhorted them to enter upon the great work before them with a determined and resolute spirit, saying that if the Greeks were once subdued, no other enemies able at all to cope with the Persians would be left on the habitable globe.

On the dismission of the council, orders were given to commence the crossing of the bridge the next day at sunrise. The preparations were made accordingly. In the morning, as soon as it was light, and while waiting for the rising of the sun, they burned upon the bridge all manner of perfumes, and strewed the way with branches of myrtle, the emblem of triumph and joy. As the time for the rising of the sun drew nigh, Xerxes stood with a golden vessel full of wine, which he was to pour out as a libation as soon as the first dazzling beams should appear above the horizon. When, at length, the moment arrived, he poured out the wine into the sea, throwing the vessel in which it had been contained after it as an offering. He also threw in, at the same time, a golden goblet of great value, and a Persian cimeter. The ancient historian who records these facts was uncertain whether these offerings were intended as acts of adoration addressed to the sun, or as oblations presented to the sea--a sort of peace offering, perhaps, to soothe the feelings of the mighty monster, irritated and chafed by the chastisement which it had previously received.

[Illustration: XERXES CROSSING THE HELLESPONT.]

One circumstance indicated that the offering was intended for the sun, for, at the time of making it, Xerxes addressed to the great luminary a sort of petition, which might be considered either an apostrophe or a prayer, imploring its protection. He called upon the sun to accompany and defend the expedition, and to preserve it from every calamity until it should have accomplished its mission of

subjecting all Europe to the Persian sway.

The army then commenced its march. The order of march was very much the same as that which had been observed in the departure from Sardis. The beasts of burden and the baggage were preceded and followed by immense bodies of troops of all nations. The whole of the first day was occupied by the passing of this part of the army. Xerxes himself, and the sacred portion of the train, were to follow them on the second day. Accordingly, there came, on the second day, first, an immense squadron of horse, with garlands on the heads of the horsemen; next, the sacred horses and the sacred car of Jupiter. Then came Xerxes himself, in his war chariot, with trumpets sounding, and banners waving in the air. At the moment when Xerxes's chariot entered upon the bridge, the fleet of galleys, which had been drawn up in preparation near the Asiatic shore, were set in motion, and moved in a long and majestic line across the strait to the European side, accompanying and keeping pace with their mighty master in his progress. Thus was spent the second day.

Five more days were consumed in getting over the remainder of the army, and the immense trains of beasts and of baggage which followed. The officers urged the work forward as rapidly as possible, and, toward the end, as is always the case in the movement of such enormous masses, it became a scene of inconceivable noise, terror, and confusion. The officers drove forward men and beasts alike by the lashes of their whips--every one struggling, under the influence of such stimulants, to get forward--while fallen animals, broken wagons, and the bodies of those exhausted and dying with excitement and fatigue, choked the way. The mighty mass was, however, at last transferred to the European continent, full of anxious fears in respect to what awaited them, but yet having very faint and feeble conceptions of the awful scenes in which the enterprise of their reckless leader was to end.

CHAPTER VI.

THE REVIEW OF THE TROOPS AT DORISCUS.

The fleet and the army separate.--The Chersonesus.--Sufferings from thirst.--The Hebrus.--Plain of Doriscus.--Preparations for the great review.--Mode of taking a census.--Immense numbers of the troops.--The cavalry.--Corps of Arabs and Egyptians.--Sum total of the army.--Various nations.--Dress and equipments.--Uncouth costumes.--Various weapons.--The lasso.--Dresses of various kinds.--The Immortals.--Privileges of the Immortals.--The fleet.--Xerxes reviews the troops.--He reviews the fleet.--A lady admiral.--Her abilities.--Number of vessels in the fleet.--Demaratus the Greek.--Story of Demaratus.--Childhood of his mother.--The change.--Ariston, king of Sparta.--The agreement.--Birth of Demaratus.--Demaratus disowned.--His flight.--Question of Xerxes.--Perplexity of Demaratus.--Demaratus describes the Spartans.--Surprise of Xerxes.--Reply of Xerxes.--His displeasure.--Demaratus's apology.--His gratitude to Darius.--Demaratus's defense of the Spartans.--They are governed by law.--Xerxes resumes his march.--Division of the army.--The Strymon.--Human sacrifices.--Arrival at the canal.--Death of the engineer.--Burial of the engineer.--A grand feast.--Scene of revelry.--Desolation and depopulation of the country.

As soon as the expedition of Xerxes had crossed the Hellespont and arrived safely on the European side, as narrated in the last chapter, it became necessary for the fleet and the army to separate, and to move, for a time, in opposite directions from each other. The reader will observe, by examining the map, that the army, on reaching the European shore, at the point to which they would be conducted by a bridge at Abydos, would find themselves in the middle of a long and narrow peninsula called the Chersonesus, and that, before commencing its regular march along the northern coast of the AEgean Sea, it would be necessary first to proceed for fifteen or twenty miles to the eastward, in order to get round the bay by which the peninsula is bounded on the north and west. While, therefore, the fleet went directly westward along the coast, the army turned to the eastward, a place of rendezvous having been appointed on the northern coast of the sea, where they were all soon to meet again.

The army moved on by a slow and toilsome progress until it reached the neck of the peninsula, and then turning at the head of the bay, it moved westward again, following the direction of the coast. The line of march was, however, laid at some distance from the shore, partly for the sake of avoiding the indentations made in the land by gulfs and bays, and partly for the sake of crossing the streams from the interior at points so far inland that the water found in them should be fresh and pure. Notwithstanding these precautions, however, the water often failed. So immense were the multitudes of men and of beasts, and so craving was the thirst which the heat and the fatigues of the march engendered, that, in several instances, they drank the little rivers dry.

The first great and important river which the army had to pass after entering Europe was the Hebrus. Not far from the mouth of the Hebrus, where it emptied into the AEgean Sea, was a great plain, which was called the plain of Doriscus. There was an extensive

fortress here, which had been erected by the orders of Darius when he had subjugated this part of the country. The position of this fortress was an important one, because it commanded the whole region watered by the Hebrus, which was a very fruitful and populous district. Xerxes had been intending to have a grand review and enumeration of his forces on entering the European territories, and he judged Doriscus to be a very suitable place for his purpose. He could establish his own head-quarters in the fortress, while his armies could be marshaled and reviewed on the plain. The fleet, too, had been ordered to draw up to the shore at the same spot, and when the army reached the ground, they found the vessels already in the offing.

The army accordingly halted, and the necessary arrangements were made for the review. The first thing was to ascertain the numbers of the troops; and as the soldiers were too numerous to be counted, Xerxes determined to _measure_ the mighty mass as so much bulk, and then ascertain the numbers by a computation. They made the measure itself in the following manner: They counted off, first, ten thousand men, and brought them together in a compact circular mass, in the middle of the plain, and then marked a line upon the ground inclosing them. Upon this line, thus determined, they built a stone wall, about four feet high, with openings on opposite sides of it, by which men might enter and go out. When the wall was built, soldiers were sent into the inclosure--just as corn would be poured by a husbandman into a wooden peck--until it was full. The mass thus required to fill the inclosure was deemed and taken to be ten thousand men. This was the first filling of the measure. These men were then ordered to retire, and a fresh mass was introduced, and so on until the whole army was measured. The inclosure was filled one hundred and seventy times with the foot soldiers before the process was completed, indicating, as the total amount of the infantry of the army, a force of one million seven hundred thousand men. This enumeration, it must be remembered, included the land forces alone.

This method of measuring the army in bulk was applied only to the foot soldiers; they constituted the great mass of the forces convened. There were, however, various other bodies of troops in the army, which, from their nature, were more systematically organized than the common foot soldiers, and so their numbers were known by the regular enrollment. There was, for example, a cavalry force of eighty thousand men. There was also a corps of Arabs, on camels, and another of Egyptians, in war chariots, which together amounted to twenty thousand. Then, besides these land forces, there were half a million of men in the fleet. Immense as these numbers are, they were still further increased, as the army moved on, by Xerxes's system of compelling the forces of every kingdom and province through which he passed to join the expedition; so that, at length, when the Persian king fairly entered the heart of the Greek territory, Herodotus, the great narrator of his history, in summing up the whole number of men regularly connected with the army, makes a total of about five millions of men. One hundred thousand men, which is but one fiftieth part of five millions, is considered, in modern times, an immense army; and, in fact, half even of that number was thought, in the time of the American Revolution, a sufficient force to threaten the colonies with overwhelming destruction. "If ten thousand men will not do to put down the rebellion," said an orator in the House of Commons, "fifty thousand _shall_."

Herodotus adds that, besides the five millions regularly connected with the army, there was an immense and promiscuous mass of women, slaves, cooks, bakers, and camp followers of every description, that no human powers could estimate or number.

But to return to the review. The numbers of the army having been ascertained, the next thing was to marshal and arrange the men by nations under their respective leaders, to be reviewed by the king. A very full enumeration of these divisions of the army is given by the historians of the day, with minute descriptions of the kind of armor which the troops of the several nations wore. There were more than fifty of these nations in all. Some of them were highly civilized, others were semi-barbarous tribes; and, of course, they presented, as marshaled in long array upon the plain, every possible variety of dress and equipment. Some were armed with brazen helmets, and coats of mail formed of plates of iron; others wore linen tunics, or rude garments made of the skins of beasts. The troops of one nation had their heads covered with helmets, those of another with miters, and of a third with tiaras. There was one savage-looking horde that had caps made of the skin of the upper part of a horse's head, in its natural form, with the ears standing up erect at the top, and the mane flowing down behind. These men held the skins of cranes before them instead of shields, so that they looked like horned monsters, half beast and half bird, endeavoring to assume the guise and attitude of men. There was another corps whose men were really horned, since they wore caps made from the skins of the heads of oxen, with the horns standing. Wild beasts were personated, too, as well as tame; for some nations were clothed in lions' skins, and others in panthers' skins--the clothing being considered, apparently, the more honorable, in proportion to the ferocity of the brute to which it had originally belonged.

The weapons, too, were of every possible form and guise. Spears--some pointed with iron, some with stone, and others shaped simply by being burned to a point in the fire; bows and arrows, of every variety of material and form, swords, daggers, slings, clubs, darts, javelins, and every other imaginable species of weapon which human ingenuity, savage or civilized, had then conceived. Even the lasso--the weapon of the American aborigines of modern times--was there. It is described by the ancient historian as a

long thong of leather wound into a coil, and finished in a noose at the end, which noose the rude warrior who used the implement launched through the air at the enemy, and entangling rider and horse together by means of it, brought them both to the ground.

There was every variety of taste, too, in the fashion and the colors of the dresses which were worn. Some were of artificial fabrics, and dyed in various and splendid hues. Some were very plain, the wearers of them affecting a simple and savage ferocity in the fashion of their vesture. Some tribes had painted skins--beauty, in their view, consisting, apparently, in hideousness. There was one barbarian horde who wore very little clothing of any kind. They had knotty clubs for weapons, and, in lieu of a dress, they had painted their naked bodies half white and half a bright vermilion.

In all this vast array, the corps which stood at the head, in respect to their rank and the costliness and elegance of their equipment, was a Persian squadron of ten thousand men, called the Immortals. They had received this designation from the fact that the body was kept always exactly full, as, whenever any one of the number died, another soldier was instantly put into his place, whose life was considered in some respects a continuation of the existence of the man who had fallen. Thus, by a fiction somewhat analogous to that by which the king, in England, never dies, these ten thousand Persians were an immortal band. They were all carefully-selected soldiers, and they enjoyed very unusual privileges and honors. They were mounted troops, and their dress and their armor were richly decorated with gold. They were accompanied in their campaigns by their wives and families, for whose use carriages were provided which followed the camp, and there was a long train of camels besides, attached to the service of the corps, to carry their provisions and their baggage.

While all these countless varieties of land troops were marshaling and arranging themselves upon the plain, each under its own officers and around its own standards, the naval commanders were employed in bringing up the fleet of galleys to the shore, where they were anchored in a long line not far from the beach, and with their prows toward the land. Thus there was a space of open water left between the line of vessels and the beach, along which Xerxes's barge was to pass when the time for the naval part of the review should arrive.

When all things were ready, Xerxes mounted his war chariot and rode slowly around the plain, surveying attentively, and with great interest and pleasure, the long lines of soldiers, in all their variety of equipment and costume, as they stood displayed before him. It required a progress of many miles to see them all. When this review of the land forces was concluded, the king went to the shore, and embarked on board a royal galley which had been prepared for him, and there, seated upon the deck under a gilded canopy, he was rowed by the oarsmen along the line of ships, between their prows and the land. The ships were from many nations as well as the soldiers, and exhibited the same variety of fashion and equipment. The land troops had come from the inland realms and provinces which occupied the heart of Asia, while the ships and the seamen had been furnished by the maritime regions which extended along the coasts of the Black, and the AEgean, and the Mediterranean Seas. Thus the people of Egypt had furnished two hundred ships, the Phoenicians three hundred, Cyprus fifty, the Cilicians and the Ionians one hundred each, and so with a great many other nations and tribes.

The various squadrons which were thus combined in forming this immense fleet were manned and officered, of course, from the nations that severally furnished them, and one of them was actually commanded in person by a queen. The name of this lady admiral was Artemisia. She was the Queen of Caria, a small province in the southwestern part of Asia Minor, having Halicarnassus for its capital. Artemisia, though in history called a queen, was, in reality, more properly a regent, as she governed in the name of her son, who was yet a child. The quota of ships which Caria was to furnish was five. Artemisia, being a lady of ambitious and masculine turn of mind, and fond of adventure, determined to accompany the expedition. Not only her own vessels, but also those from some neighboring islands, were placed under her charge, so that she commanded quite an important division of the fleet. She proved, also, in the course of the voyage, to be abundantly qualified for the discharge of her duties. She became, in fact, one of the ablest and most efficient commanders in the fleet, not only maneuvering and managing her own particular division in a very successful manner, but also taking a very active and important part in the general consultations, where what she said was listened to with great respect, and always had great weight in determining the decisions. In the great battle of Salamis she acted a very conspicuous part, as will hereafter appear.

The whole number of galleys of the first class in Xerxes's fleet was more than twelve hundred, a number abundantly sufficient to justify the apprehensions of Artabanus that no harbor would be found capacious enough to shelter them in the event of a sudden storm. The line which they formed on this occasion, when drawn up side by side upon the shore for review, must have extended many miles.

Xerxes moved slowly along this line in his barge, attended by the officers of his court and the great generals of his army, who surveyed the various ships as they passed them, and noted the diverse national costumes and equipments of the men with curiosity and pleasure. Among those who attended the king on this occasion was a certain Greek named Demaratus, an exile from his native land, who had fled to Persia, and had been kindly received by Darius some years before. Having remained in the Persian court until Xerxes succeeded to the throne and undertook the invasion of Greece, he concluded to accompany the expedition.

The story of the political difficulties in which Demaratus became involved in his native land, and which led to his flight from Greece, was very extraordinary. It was this:

The mother of Demaratus was the daughter of parents of high rank and great affluence in Sparta, but in her childhood her features were extremely plain and repulsive. Now there was a temple in the neighborhood of the place where her parents resided, consecrated to Helen, a princess who, while she lived, enjoyed the fame of being the most beautiful woman in the world. The nurse recommended that the child should be taken every day to this temple, and that petitions should be offered there at the shrine of Helen that the repulsive deformity of her features might be removed. The mother consented to this plan, only enjoining upon the nurse not to let any one see the face of her unfortunate offspring in going and returning. The nurse accordingly carried the child to the temple day after day, and holding it in her arms before the shrine, implored the mercy of Heaven for her helpless charge, and the bestowal upon it of the boon of beauty.

These petitions were, it seems, at length heard, for one day, when the nurse was coming down from the temple, after offering her customary prayer, she was met and accosted by a mysterious-looking woman, who asked her what it was that she was carrying in her arms. The nurse replied that it was a child. The woman wanted to look at it. The nurse refused to show the face of the child, saying that she had been forbidden to do so. The woman, however, insisted upon seeing its face, and at last the nurse consented and removed the coverings. The stranger stroked down the face of the child, saying, at the same time, that now that child should become the most beautiful woman of Sparta.

Her words proved true. The features of the young girl rapidly changed, and her countenance soon became as wonderful for its loveliness as it had been before for its hideous deformity. When she arrived at a proper age, a certain Spartan nobleman named Agetus, a particular friend of the king's, made her his wife.

The name of the king of Sparta at that time was Ariston. He had been twice married, and his second wife was still living, but he had no children. When he came to see and to know the beautiful wife of Agetus, he wished to obtain her for himself, and began to revolve the subject in his mind, with a view to discover some method by which he might hope to accomplish his purpose. He decided at length upon the following plan. He proposed to Agetus to make an exchange of gifts, offering to give to him any one object which he might choose from all his, that is, Ariston's effects, provided that Agetus would, in the same manner, give to Ariston whatever Ariston might choose. Agetus consented to the proposal, without, however, giving it any serious consideration. As Ariston was already married, he did not for a moment imagine that his wife could be the object which the king would demand. The parties to this foolish agreement confirmed the obligation of it by a solemn oath, and then each made known to the other what he had selected. Agetus gained some jewel, or costly garment, or perhaps a gilded and embellished weapon, and lost forever his beautiful wife. Ariston repudiated his own second wife, and put the prize which he had thus surreptitiously acquired in her place as a third.

About seven or eight months after this time Demaratus was born. The intelligence was brought to Ariston one day by a slave, when he was sitting at a public tribunal. Ariston seemed surprised at the intelligence, and exclaimed that the child was not his. He, however, afterward retracted this disavowal, and owned Demaratus as his son. The child grew up, and in process of time, when his father died, he succeeded to the throne. The magistrates, however, who had heard the declaration of his father at the time of his birth, remembered it, and reported it to others; and when Ariston died and Demaratus assumed the supreme power, the next heir denied his right to the succession, and in process of time formed a strong party against him. A long series of civil dissensions arose, and at length the claims of Demaratus were defeated, his enemies triumphed, and he fled from the country to save his life. He arrived at Susa near the close of Darius's reign, and it was his counsel which led the king to decide the contest among his sons for the right of succession, in favor of Xerxes, as described at the close of the first chapter. Xerxes had remembered his obligations to Demaratus for this interposition. He had retained him in the royal court after his accession to the throne, and had bestowed upon him many marks of distinction and honor.

Demaratus had decided to accompany Xerxes on his expedition into Greece, and now, while the Persian officers were looking with so much pride and pleasure on the immense preparations which they were making for the subjugation of a foreign and hostile state,

Demaratus, too, was in the midst of the scene, regarding the spectacle with no less of interest, probably, and yet, doubtless, with very different feelings, since the country upon which this dreadful cloud of gloom and destruction was about to burst was his own native land.

After the review was ended, Xerxes sent for Demaratus to come to the castle. When he arrived, the king addressed him as follows:

"You are a Greek, Demaratus, and you know your countrymen well; and now, as you have seen the fleet and the army that have been displayed here to-day, tell me what is your opinion. Do you think that the Greeks will undertake to defend themselves against such a force, or will they submit at once without attempting any resistance?"

Demaratus seemed at first perplexed and uncertain, as if not knowing exactly what answer to make to the question. At length he asked the king whether it was his wish that he should respond by speaking the blunt and honest truth, or by saying what would be polite and agreeable.

Xerxes replied that he wished him, of course, to speak the truth. The truth itself would be what he should consider the most agreeable.

"Since you desire it, then," said Demaratus, "I will speak the exact truth. Greece is the child of poverty. The inhabitants of the land have learned wisdom and discipline in the severe school of adversity, and their resolution and courage are absolutely indomitable. They all deserve this praise; but I speak more particularly of my own countrymen, the people of Sparta. I am sure that they will reject any proposal which you may make to them for submission to your power, and that they will resist you to the last extremity. The disparity of numbers will have no influence whatever on their decision. If all the rest of Greece were to submit to you, leaving the Spartans alone, and if they should find themselves unable to muster more than a thousand men, they would give you battle."

Xerxes expressed great surprise at this assertion, and thought that Demaratus could not possibly mean what he seemed to say. "I appeal to yourself," said he; "would _you_ dare to encounter, alone, ten men? You have been the prince of the Spartans, and a prince ought, at least, to be equal to two common men; so that to show that the Spartans in general could be brought to fight a superiority of force of even ten to one, it ought to appear that you would dare to engage twenty. This is manifestly absurd. In fact, for any person to pretend to be able or willing to fight under such a disparity of numbers, evinces only pride and insolent presumption. And even this proportion of ten to one, or even twenty to one, is nothing compared to the real disparity; for, even if we grant to the Spartans as large a force as there is any possibility of their obtaining, I shall then have _a thousand_ to one against them.

"Besides," continued the king, "there is a great difference in the character of the troops. The Greeks are all freemen, while my soldiers are all slaves--bound absolutely to do my bidding, without complaint or murmur. Such soldiers as mine, who are habituated to submit entirely to the will of another, and who live under the continual fear of the lash, might, perhaps, be forced to go into battle against a great superiority of numbers, or under other manifest disadvantages; but free men, never. I do not believe that a body of Greeks could be brought to engage a body of Persians, man for man. Every consideration shows, thus, that the opinion which you have expressed is unfounded. You could only have been led to entertain such an opinion through ignorance and unaccountable presumption."

"I was afraid," replied Demaratus, "from the first, that, by speaking the truth, I should offend you. I should not have given you my real opinion of the Spartans if you had not ordered me to speak without reserve. You certainly can not suppose me to have been influenced by a feeling of undue partiality for the men whom I commended, since they have been my most implacable and bitter enemies, and have driven me into hopeless exile from my native land. Your father, on the other hand, received and protected me, and the sincere gratitude which I feel for the favors which I have received from him and from you incline me to take the most favorable view possible of the Persian cause.

"I certainly should not be willing, as you justly suppose, to engage, alone, twenty men, or ten, or even one, unless there was an absolute necessity for it. I do not say that any single Lacedaemonian could successfully encounter ten or twenty Persians, although in personal conflicts they are certainly not inferior to other men. It is when they are combined in a body even though that body be small, that their great superiority is seen.

"As to their being free, and thus not easily led into battle in circumstances of imminent danger, it must be considered that their freedom is not absolute, like that of savages in a fray, where each acts according to his own individual will and pleasure, but it is qualified and controlled by law. The Spartan soldiers are not personal slaves, governed by the lash of a master, it is true; but they

have certain principles of obligation and duty which they all feel most solemnly bound to obey. They stand in greater awe of the authority of this law than your subjects do of the lash. It commands them never to fly from the field of battle, whatever may be the number of their adversaries. It commands them to preserve their ranks, to stand firm at the posts assigned them, and there to conquer or die.

"This is the truth in respect to them. If what I say seems to you absurd, I will in future be silent. I have spoken honestly what I think, because your majesty commanded me to do so; and, notwithstanding what I have said, I sincerely wish that all your majesty's desires and expectations may be fulfilled."

The ideas which Demaratus thus appeared to entertain of danger to the countless and formidable hosts of Xerxes's army, from so small and insignificant a power as that of Sparta, seemed to Xerxes too absurd to awaken any serious displeasure in his mind. He only smiled, therefore, at Demaratus's fears, and dismissed him.

Leaving a garrison and a governor in possession of the castle of Doriscus, Xerxes resumed his march along the northern shores of the AEgean Sea, the immense swarms of men filling all the roads, devouring every thing capable of being used as food, either for beast or man, and drinking all the brooks and smaller rivers dry. Even with this total consumption of the food and the water which they obtained on the march, the supplies would have been found insufficient if the whole army had advanced through one tract of country. They accordingly divided the host into three great columns, one of which kept near the shore; the other marched far in the interior, and the third in the intermediate space. They thus exhausted the resources of a very wide region. All the men, too, that were capable of bearing arms in the nations that these several divisions passed on the way, they compelled to join them, so that the army left, as it moved along, a very broad extent of country trampled down, impoverished, desolate, and full of lamentation and woe. The whole march was perhaps the most gigantic crime against the rights and the happiness of man that human wickedness has ever been able to commit.

The army halted, from time to time, for various purposes, sometimes for the performance of what they considered religions ceremonies, which were intended to propitiate the supernatural powers of the earth and of the air. When they reached the Strymon, where, it will be recollected, a bridge had been previously built, so as to be ready for the army when it should arrive, they offered a sacrifice of five white horses to the river. In the same region, too, they halted at a place called the Nine Ways, where Xerxes resolved to offer a human sacrifice to a certain god whom the Persians believed to reside in the interior of the earth. The mode of sacrificing to this god was to bury the wretched victims alive. The Persians seized, accordingly, by Xerxes's orders, nine young men and nine girls from among the people of the country, and buried them alive!

Marching slowly on in this manner, the army at length reached the point upon the coast where the canal had been cut across the isthmus of Mount Athos. The town which was nearest to this spot was Acanthus, the situation of which, together with that of the canal, will be found upon the map. The fleet arrived at this point by sea nearly at the same time with the army coming by land. Xerxes examined the canal, and was extremely well satisfied with its construction. He commended the chief engineer, whose name was Artachaees, in the highest terms, for the successful manner in which he had executed the work, and rendered him very distinguished honors.

It unfortunately happened, however, that, a few days after the arrival of the fleet and the army at the canal, and before the fleet had commenced the passage of it, that Artachaees died. The king considered this event as a serious calamity to him, as he expected that other occasions would arrive on which he would have occasion to avail himself of the engineer's talents and skill. He ordered preparations to be made for a most magnificent burial, and the body was in due time deposited in the grave with imposing funeral solemnities. A very splendid monument, too, was raised upon the spot, which employed, for some time, all the mechanical force of the army in its erection.

While Xerxes remained at Acanthus, he required the people of the neighboring country to entertain his army at a grand feast, the cost of which totally ruined them. Not only was all the food of the vicinity consumed, but all the means and resources of the inhabitants, of every kind, were exhausted in the additional supplies which they had to procure from the surrounding regions. At this feast the army in general ate, seated in groups upon the ground, in the open air; but for Xerxes and the nobles of the court a great pavilion was built, where tables were spread, and vessels and furniture of silver and gold, suitable to the dignity of the occasion, were provided. Almost all the property which the people of the region had accumulated by years of patient industry was consumed at once in furnishing the vast amount of food which was required for this feast, and the gold and silver plate which was to be used in the pavilion. During the entertainment, the inhabitants of the country waited upon their exacting and insatiable guests until they

were utterly exhausted by the fatigues of the service. When, at length, the feast was ended, and Xerxes and his company left the pavilion, the vast assembly outside broke up in disorder, pulled the pavilion to pieces, plundered the tables of the gold and silver plate, and departed to their several encampments, leaving nothing behind them.

The inhabitants of the country were so completely impoverished and ruined by these exactions, that those who were not impressed into Xerxes's service and compelled to follow his army, abandoned their homes, and roamed away in the hope of finding elsewhere the means of subsistence which it was no longer possible to obtain on their own lands; and thus, when Xerxes at last gave orders to the fleet to pass through the canal, and to his army to resume its march, he left the whole region utterly depopulated and desolate.

He went on to Therma, a port situated on the northwestern corner of the AEgean Sea, which was the last of his places of rendezvous before his actual advance into Greece.

CHAPTER VII.

THE PREPARATIONS OF THE GREEKS FOR DEFENSE.

B.C. 480

The Greeks.--The two prominent states of Greece.--Greek kings.--The two kings of Sparta.--Origin of the custom of two kings.--The twins.--The Delphic oracle consulted.--Plan for ascertaining the eldest.--Civil dissensions.--Two lines established.--Character of the Spartans.--Their lofty spirit.--The Athenians.--The city of Athens.--Sparta and Athens defy the Persians.--Earth and water.--Spirit of the Spartans.--The blank tablets.--Leonidas.--His wife discovers the writing on the tablets.--The three spies.--Alarm at Athens.--The Greeks consult the Delphic oracle.--The responses.--Various interpretations of the oracle.--The Athenian fleet.--Themistocles.--Proposed confederation.--Council of Spartans and Athenians.--The Argives reject the propositions of the Spartans.--Embassy to Sicily.--Demands of Gelon.--The embassadors go to Corcyra.--The River Peneus.--The Vale of Tempe.--Straits of Thermopylae.--Question to be decided.--Messengers from Thessaly.--Negotiations.--Decision to defend the Olympic Straits.--Sailing of the fleet.--Advice of the King of Macedon.--The Greeks fall back to Thermopylae.--Xerxes visits Thessaly.--Beautiful rural scene.--Conversation of Xerxes at the Olympic Pass.

We must now leave, for a time, the operations of Xerxes and his army, and turn our attention to the Greeks, and to the preparations which they were making to meet the emergency.

The two states of Greece which were most prominent in the transactions connected with the invasion of Xerxes were Athens and Sparta. By referring to the map, Athens will be found to have been situated upon a promontory just without the Peloponnesus, while Sparta, on the other hand, was in the center of a valley which lay in the southern part of the peninsula. Each of these cities was the center and strong-hold of a small but very energetic and powerful commonwealth. The two states were entirely independent of each other, and each had its own peculiar system of government, of usages, and of laws. These systems, and, in fact, the characters of the two communities, in all respects, were extremely dissimilar.

Both these states, though in name republics, had certain magistrates, called commonly, in history, kings. These kings were, however, in fact, only military chieftains, commanders of the armies rather than sovereign rulers of the state. The name by which such a chieftain was actually called by the people themselves, in those days, was _tyrannus_, the name from which our word _tyrant_ is derived. As, however, the word _tyrannus_ had none of that opprobrious import which is associated with its English derivative, the latter is not now a suitable substitute for the former. Historians, therefore, commonly use the word king instead, though that word does not properly express the idea. They were commanders, chieftains, hereditary generals, but not strictly kings. We shall, however, often call them kings, in these narratives, in conformity with the general usage. Demaratus, who had fled from Sparta to seek refuge with Darius, and who was now accompanying Xerxes on his march to Greece, was one of these kings.

It was a peculiarity in the constitution of Sparta that, from a very early period of its history, there had been always two kings, who had held the supreme command in conjunction with each other, like the Roman consuls in later times. This custom was sustained partly by the idea that by this division of the executive power of the state, the exercise of the power was less likely to become despotic or tyrannical. It had its origin, however, according to the ancient legends, in the following singular occurrences:

At a very early period in the history of Sparta, when the people had always been accustomed, like other states, to have one prince or chieftain, a certain prince died, leaving his wife, whose name was Argia, and two infant children, as his survivors. The children

were twins, and the father had died almost immediately after they were born. Now the office of king was in a certain sense hereditary, and yet not absolutely so; for the people were accustomed to assemble on the death of the king, and determine who should be his successor, choosing always, however, the oldest son of the former monarch, unless there was some very extraordinary and imperious reason for not doing so. In this case they decided, as usual, that the oldest son should be king.

But here a very serious difficulty arose, which was, to determine which of the twins was the oldest son. They resembled each other so closely that no stranger could distinguish one from the other at all. The mother said that she could not distinguish them, and that she did not know which was the first-born. This was not strictly true; for she did, in fact, know, and only denied her power to decide the question because she wished to have both of her children kings.

In this perplexity the Spartans sent to the oracle at Delphi to know what they were to do. The oracle gave, as usual, an ambiguous and unsatisfactory response. It directed the people to make both the children kings, but to render the highest honors to the first-born. When this answer was reported at Sparta, it only increased the difficulty; for how were they to render peculiar honors to the first-born unless they could ascertain which the first-born was?

In this dilemma, some person suggested to the magistrates that perhaps Argia really knew which was the eldest child, and that if so, by watching her, to see whether she washed and fed one, uniformly, before the other, or gave it precedence in any other way, by which her latent maternal instinct or partiality might appear, the question might possibly be determined. This plan was accordingly adopted. The magistrates contrived means to place a servant maid in the house to watch the mother in the way proposed, and the result was that the true order of birth was revealed. From that time forward, while they were both considered as princes, the one now supposed to be the first-born took precedence of the other.

When, however, the children arrived at an age to assume the exercise of the governmental power, as there was no perceptible difference between them in age, or strength, or accomplishments, the one who had been decided to be the younger was little disposed to submit to the other. Each had his friends and adherents, parties were formed, and a long and angry civil dissension ensued. In the end the question was compromised, the command was divided, and the system of having two chief magistrates became gradually established, the power descending in two lines, from father to son, through many generations. Of course there was perpetual jealousy and dissension, and often open and terrible conflicts, between these two rival lines.

The Spartans were an agricultural people, cultivating the valley in the southeastern part of the Peloponnesus, the waters of which were collected and conveyed to the sea by the River Eurotas and its branches. They lived in the plainest possible manner, and prided themselves on the stern and stoical resolution with which they rejected all the refinements and luxuries of society. Courage, hardihood, indifference to life, and the power to endure without a murmur the most severe and protracted sufferings, were the qualities which they valued. They despised wealth just as other nations despise effeminacy and foppery. Their laws discouraged commerce, lest it should make some of the people rich. Their clothes were scanty and plain, their houses were comfortless, their food was a coarse bread, hard and brown, and their money was of iron. With all this, however, they were the most ferocious and terrible soldiers in the world.

They were, moreover, with all their plainness of manners and of life, of a very proud and lofty spirit. All agricultural toil, and every other species of manual labor in their state, were performed by a servile peasantry, while the free citizens, whose profession was exclusively that of arms, were as aristocratic and exalted in soul as any nobles on earth. People are sometimes, in our day, when money is so much valued, proud, notwithstanding their poverty. The Spartans were proud of their poverty itself. They could be rich if they chose, but they despised riches. They looked down on all the refinements and delicacies of dress and of living from an elevation far above them. They looked down on labor, too, with the same contempt. They were yet very nice and particular about their dress and military appearance, though every thing pertaining to both was coarse and simple, and they had slaves to wait upon them even in their campaigns.

The Athenians were a totally different people. The leading classes in their commonwealth were cultivated, intellectual, and refined. The city of Athens was renowned for the splendor of its architecture, its temples, its citadels, its statues, and its various public institutions, which in subsequent times made it the great intellectual center of Europe. It was populous and wealthy. It had a great commerce and a powerful fleet. The Spartan character, in a word, was stern, gloomy, indomitable, and wholly unadorned. The Athenians were rich, intellectual, and refined. The two nations were nearly equal in power, and were engaged in a perpetual and incessant rivalry.

[Illustration: FATE OF THE PERSIAN EMBASSADORS AT SPARTA.]

There were various other states and cities in Greece, but Athens and Sparta were at this time the most considerable, and they were altogether the most resolute and determined in their refusal to submit to the Persian sway. In fact, so well known and understood was the spirit of defiance with which these two powers were disposed to regard the Persian invasion, that when Xerxes sent his summons demanding submission, to the other states of Greece, he did not send any to these. When Darius invaded Greece some years before, he had summoned Athens and Sparta as well as the others, but his demands were indignantly rejected. It seems that the custom was for a government or a prince, when acknowledging the dominion of a superior power, to send, as a token of territorial submission, a little earth and water, which was a sort of legal form of giving up possession of their country to the sovereign who claimed it. Accordingly, when Darius sent his embassadors into Greece to summon the country to surrender, the embassadors, according to the usual form, called upon the governments of the several states to send earth and water to the king. The Athenians, as has been already said, indignantly refused to comply with this demand. The Spartans, not content with a simple refusal, seized the embassadors and threw them into a well, telling them, as they went down, that if they wanted earth and water for the King of Persia, they might get it there.

The Greeks had obtained some information of Xerxes's designs against them before they received his summons. The first intelligence was communicated to the Spartans by Demaratus himself, while he was at Susa, in the following singular manner. It was the custom, in those days, to write with a steel point on a smooth surface of wax. The wax was spread for this purpose on a board or tablet of metal, in a very thin stratum, forming a ground upon which the letters traced with the point were easily legible. Demaratus took two writing-tablets such as these, and removing the wax from them, he wrote a brief account of the proposed Persian invasion, by tracing the characters upon the surface of the wood or metal itself, beneath; then, restoring the wax so as to conceal the letters, he sent the two tablets, seemingly blank, to Leonidas, king of Sparta. The messengers who bore them had other pretexts for their journey, and they had various other articles to carry. The Persian guards who stopped and examined the messengers from time to time along the route, thought nothing of the blank tablets, and so they reached Leonidas in safety.

Leonidas being a blunt, rough soldier, and not much accustomed to cunning contrivances himself, was not usually much upon the watch for them from others, and when he saw no obvious communication upon the tablets, he threw them aside, not knowing what the sending of them could mean, and not feeling any strong interest in ascertaining. His wife, however--her name was Gorgo--had more curiosity. There was something mysterious about the affair, and she wished to solve it. She examined the tablets attentively in every part, and at length removed cautiously a little of the wax. The letters began to appear. Full of excitement and pleasure, she proceeded with the work until the whole cereous coating was removed. The result was, that the communication was revealed, and Greece received the warning.

When the Greeks heard that Xerxes was at Sardis, they sent three messengers in disguise, to ascertain the facts in respect to the Persian army assembled there, and, so far as possible, to learn the plans and designs of the king. Notwithstanding all the efforts of these men to preserve their concealment and disguise, they were discovered, seized, and tortured by the Persian officer who took them, until they confessed that they were spies. The officer was about to put them to death, when Xerxes himself received information of the circumstances. He forbade the execution, and directed, on the other hand, that the men should be conducted through all his encampments, and be allowed to view and examine every thing. He then dismissed them, with orders to return to Greece and report what they had seen. He thought, he said, that the Greeks would be more likely to surrender if they knew how immense his preparations were for effectually vanquishing them if they attempted resistance.

The city of Athens, being farther north than Sparta, would be the one first exposed to danger from the invasion, and when the people heard of Xerxes's approach, the whole city was filled with anxiety and alarm. Some of the inhabitants were panic-stricken, and wished to submit; others were enraged, and uttered nothing but threats and defiance. A thousand different plans of defense were proposed and eagerly discussed. At length the government sent messengers to the oracle at Delphi, to learn what their destiny was to be, and to obtain, if possible, divine direction in respect to the best mode of averting the danger. The messengers received an awful response, portending, in wild and solemn, though dark and mysterious language, the most dreadful calamities to the ill-fated city. The messengers were filled with alarm at hearing this reply. One of the inhabitants of Delphi, the city in which the oracle was situated, proposed to them to make a second application, in the character of the most humble supplicants, and to implore that the oracle would give them some directions in respect to the best course for them to pursue in order to avoid, or, at least, to mitigate the impending danger. They did so, and after a time they received an answer, vague, mysterious, and almost unintelligible, but which seemed to denote that the safety of the city was connected in some manner with Salamis, and with certain "wooden walls," to which the inspired distich of the response obscurely alluded.

The messengers returned to Athens and reported the answer which they had received. The people were puzzled and perplexed in their attempts to understand it. It seems that the citadel of Athens had been formerly surrounded by a wooden palisade. Some thought that this was what was referred to by the "wooden walls," and that the meaning of the oracle was that they must rebuild the palisade, and then retreat to the citadel when the Persians should approach, and defend themselves there.

Others conceived that the phrase referred to ships, and that the oracle meant to direct them to meet their enemies with a fleet upon the sea. Salamis, which was also mentioned by the oracle, was an island not far from Athens, being west of the city, between it and the Isthmus of Corinth. Those who supposed that by the "wooden walls" was denoted the fleet, thought that Salamis might have been alluded to as the place near which the great naval battle was to be fought. This was the interpretation which seemed finally to prevail.

The Athenians had a fleet of about two hundred galleys. These vessels had been purchased and built, some time before this, for the Athenian government, through the influence of a certain public officer of high rank and influence, named Themistocles. It seems that a large sum had accumulated in the public treasury, the produce of certain mines belonging to the city, and a proposal was made to divide it among the citizens, which would have given a small sum to each man. Themistocles opposed this proposition, and urged instead that the government should build and equip a fleet with the money. This plan was finally adopted. The fleet was built, and it was now determined to call it into active service to meet and repel the Persians, though the naval armament of Xerxes was six times as large.

The next measure was to establish a confederation, if possible, of the Grecian states, or at least of all those who were willing to combine, and thus to form an allied army to resist the invader. The smaller states were very generally panic-stricken, and had either already signified their submission to the Persian rule, or were timidly hesitating, in doubt whether it would be safer for them to submit to the overwhelming force which was advancing against them, or to join the Athenians and the Spartans in their almost desperate attempts to resist it. The Athenians and Spartans settled, for the time, their own quarrels, and held a council to take the necessary measures for forming a more extended confederation.

All this took place while Xerxes was slowly advancing from Sardis to the Hellespont, and from the Hellespont to Doriscus, as described in the preceding chapter.

The council resolved on dispatching an embassy at once to all the states of Greece, as well as to some of the remoter neighboring powers, asking them to join the alliance.

The first Greek city to which these embassadors came was Argos, which was the capital of a kingdom or state lying between Athens and Sparta, though within the Peloponnesus. The states of Argos and of Sparta, being neighbors, had been constantly at war. Argos had recently lost six thousand men in a battle with the Spartans, and were, consequently, not likely to be in a very favorable mood for a treaty of friendship and alliance.

When the embassadors had delivered their message, the Argolians replied that they had anticipated such a proposal from the time that they had heard that Xerxes had commenced his march toward Greece, and that they had applied, accordingly, to the oracle at Delphi, to know what it would be best for them to do in case the proposal were made. The answer of the oracle had been, they said, unfavorable to their entering into an alliance with the Greeks. They were willing, however, they added, notwithstanding this, to enter into an alliance, offensive and defensive, with the Spartans, for thirty years, on condition that they should themselves have the command of half the Peloponnesian troops. They were entitled to the command of the whole, being, as they contended, the superior nation in rank, but they would waive their just claim, and be satisfied with half, if the Spartans would agree to that arrangement.

The Spartans replied that they could not agree to those conditions. They were themselves, they said, the superior nation in rank, and entitled to the whole command; and as they had two kings, and Argos but one, there was a double difficulty in complying with the Argive demand. They could not surrender one half of the command without depriving one of their kings of his rightful power.

Thus the proposed alliance failed entirely, the people of Argos saying that they would as willingly submit to the dominion of Xerxes as to the insolent demands and assumptions of superiority made by the government of Sparta.

The embassadors among other countries which they visited in their attempts to obtain alliance and aid, went to Sicily. Gelon was the King of Sicily, and Syracuse was his capital. Here the same difficulty occurred which had broken up the negotiations at Argos. The embassadors, when they arrived at Syracuse, represented to Gelon that, if the Persians subdued Greece, they would come to

Sicily next, and that it was better for him and for his countrymen that they should meet the enemy while he was still at a distance, rather than to wait until he came near. Gelon admitted the justice of this reasoning, and said that he would furnish a large force, both of ships and men, for carrying on the war, provided that he might have the command of the combined army. To this, of course, the Spartans would not agree. He then asked that he might command the fleet, on condition of giving up his claim to the land forces. This proposition the Athenian embassadors rejected, saying to Gelon that what they were in need of, and came to him to obtain, was a supply of troops, not of leaders. The Athenians, they said, were to command the fleet, being not only the most ancient nation of Greece, but also the most immediately exposed to the invasion, so that they were doubly entitled to be considered as the principals and leaders in the war.

Gelon then told the embassadors that, since they wished to obtain every thing and to concede nothing, they had better leave his dominions without delay, and report to their countrymen that they had nothing to expect from Sicily.

The embassadors went then to Corcyra, a large island on the western coast of Greece, in the Adriatic Sea. It is now called Corfu. Here they seemed to meet with their first success. The people of Corcyra acceded to the proposals made to them, and promised at once to equip and man their fleet, and send it round into the AEgean Sea. They immediately engaged in the work, and seemed to be honestly intent on fulfilling their promises. They were, however, in fact, only pretending. They were really undecided which cause to espouse, the Greek or the Persian, and kept their promised squadron back by means of various delays, until its aid was no longer needed.

But the most important of all these negotiations of the Athenians and Spartans with the neighboring states were those opened with Thessaly. Thessaly was a kingdom in the northern part of Greece. It was, therefore, the territory which the Persian armies would first enter, on turning the northwestern corner of the AEgean Sea. There were, moreover, certain points in its geographical position, and in the physical conformation of the country, that gave it a peculiar importance in respect to the approaching conflict.

By referring to the map placed at the commencement of the fifth chapter, it will be seen that Thessaly was a vast valley, surrounded on all sides by mountainous land, and drained by the River Peneus and its branches. The Peneus flows eastwardly to the AEgean Sea, and escapes from the great valley through a narrow and romantic pass lying between the Mountains Olympus and Ossa. This pass was called in ancient times the Olympic Straits, and a part of it formed a romantic and beautiful glen called the Vale of Tempe. There was a road through this pass, which was the only access by which Thessaly could be entered from the eastward.

To the south of the Vale of Tempe, the mountains, as will appear from the map, crowded so hard upon the sea as not to allow any passage to the eastward of them. The natural route of Xerxes, therefore, in descending into Greece, would be to come down along the coast until he reached the mouth of the Peneus, and then, following the river up through the Vale of Tempe into Thessaly, to pass down toward the Peloponnesus on the western side of Ossa and Pelion, and of the other mountains near the sea. If he could get through the Olympic Straits and the Vale of Tempe, the way would be open and unobstructed until he should reach the southern frontier of Thessaly, where there was another narrow pass leading from Thessaly into Greece. This last defile was close to the sea, and was called the Straits of Thermopylae.

Thus Xerxes and his hosts, in continuing their march to the southward, must necessarily traverse Thessaly, and in doing so they would have two narrow and dangerous defiles to pass--one at Mount Olympus, to get into the country, and the other at Thermopylae, to get out of it. It consequently became a point of great importance to the Greeks to determine at which of these two passes they should make their stand against the torrent which was coming down upon them.

This question would, of course, depend very much upon the disposition of Thessaly herself. The government of that country, understanding the critical situation in which they were placed, had not waited for the Athenians and Spartans to send embassadors to them, but, at a very early period of the war--before, in fact, Xerxes had yet crossed the Hellespont, had sent messengers to Athens to concert some plan of action. These messengers were to say to the Athenians that the government of Thessaly were expecting every day to receive a summons from Xerxes, and that they must speedily decide what they were to do; that they themselves were very unwilling to submit to him, but they could not undertake to make a stand against his immense host alone; that the southern Greeks might include Thessaly in their plan of defense, or exclude it, just as they thought best. If they decided to include it, then they must make a stand at the Olympic Straits, that is, at the pass between Olympus and Ossa; and to do that, it would be necessary to send a strong force immediately to take possession of the pass. If, on the contrary, they decided _not_ to defend Thessaly, then the pass of Thermopylae would be the point at which they must make their stand, and in that case Thessaly must be at liberty to submit on the first Persian summons.

The Greeks, after consultation on the subject, decided that it would be best for them to defend Thessaly, and to take their stand, accordingly, at the Straits of Olympus. They immediately put a large force on board their fleet, armed and equipped for the expedition. This was at the time when Xerxes was just about crossing the Hellespont. The fleet sailed from the port of Athens, passed up through the narrow strait called Euripus, lying between the island of Euboea and the main land, and finally landed at a favorable point of disembarkation, south of Thessaly. From this point the forces marched to the northward until they reached the Peneus, and then established themselves at the narrowest part of the passage between the mountains, strengthened their position there as much as possible, and awaited the coming of the enemy. The amount of the force was ten thousand men.

They had not been here many days before a messenger came to them from the King of Macedon, which country, it will be seen, lies immediately north of Thessaly, earnestly dissuading them from attempting to make a stand at the Vale of Tempe. Xerxes was coming on, he said, with an immense and overwhelming force, one against which it would be utterly impossible for them to make good their defense at such a point as that. It would be far better for them to fall back to Thermopylae, which, being a narrower and more rugged pass, could be more easily defended.

Besides this, the messenger said that it was possible for Xerxes to enter Thessaly without going through the Vale of Tempe at all. The country between Thessaly and Macedon was mountainous, but it was not impassable, and Xerxes would very probably come by that way. The only security, therefore, for the Greeks, would be to fall back and intrench themselves at Thermopylae. Nor was there any time to be lost. Xerxes was crossing the Hellespont, and the whole country was full of excitement and terror.

The Greeks determined to act on this advice. They broke up their encampment at the Olympic Straits, and, retreating to the southward, established themselves at Thermopylae, to await there the coming of the conqueror. The people of Thessaly then surrendered to Xerxes as soon as they received his summons.

Xerxes, from his encampment at Therma, where we left him at the close of the last chapter, saw the peaks of Olympus and Ossa in the southern horizon. They were distant perhaps fifty miles from where he stood. He inquired about them, and was told that the River Peneus flowed between them to the sea, and that through the same defile there lay the main entrance to Thessaly. He had previously determined to march his army round the other way, as the King of Macedon had suggested, but he said that he should like to see this defile. So he ordered a swift Sidonian galley to be prepared, and, taking with him suitable guides, and a fleet of other vessels in attendance on his galley, he sailed to the mouth of the Peneus, and, entering that river, he ascended it until he came to the defile.

Seen from any of the lower elevations which projected from the bases of the mountains at the head of this defile, Thessaly lay spread out before the eye as one vast valley--level, verdant, fertile, and bounded by distant groups and ranges of mountains, which formed a blue and beautiful horizon on every side. Through the midst of this scene of rural loveliness the Peneus, with its countless branches, gracefully meandered, gathering the water from every part of the valley, and then pouring it forth in a deep and calm current through the gap in the mountains at the observer's feet. Xerxes asked his guides if it would be possible to find any other place where the waters of the Peneus could be conducted to the sea. They replied that it would not be, for the valley was bounded on every side by ranges of mountainous land.

"Then," said Xerxes, "the Thessalians were wise in submitting at once to my summons; for, if they had not done so, I would have raised a vast embankment across the valley here, and thus stopped the river, turned their country into a lake, and drowned them all."

CHAPTER VIII.

THE ADVANCE OF XERXES INTO GREECE.

B.C. 480

Advance of the army.--Sailing of the fleet.--Sciathus.--Euboea.--Straits of Artemisium and Euripus.--Attica.--Saronic Gulf.--Island of Salamis.--Excitement of the country.--Signals.--Sentinels.--Movement of the fleet.--The ten reconnoitering galleys.--Guard-ships captured.--Barbarous ceremony.--A heroic Greek.--One crew escape.--The alarm spread.--Return of the Persian galleys.--The monument of stones.--Progress of the fleet.--The fleet anchors in a bay.--A coming storm.--The storm rages.--Destruction of many vessels.--Plunder of the wrecks.--Scyllias, the famous diver.--Dissensions in the Greek fleet.--Jealousy of the Athenians.--Situation of the Athenians.--Eurybiades appointed commander.--Debates in the Greek council.--Dismay of the Euboeans.--The Greek

leaders bribed.--Precautions of the Persians.--Designs of the Persians discovered.--The Greeks decide to give battle.--Euripus and Artemisium.--Advance of the Greeks.--The battle.--A stormy night.--Scene of terror.--A calm after the storm.--Terror of the Euboeans.--Their plans.--The Greeks retire.--Inscription on the rocks.--The commanders of the Persian fleet summoned to Thermopylae.

From Therma--the last of the great stations at which the Persian army halted before its final descent upon Greece--the army commenced its march, and the fleet set sail, nearly at the same time, which was early in the summer. The army advanced slowly, meeting with the usual difficulties and delays, but without encountering any special or extraordinary occurrences, until, after having passed through Macedon into Thessaly, and through Thessaly to the northern frontier of Phocis, they began to approach the Straits of Thermopylae. What took place at Thermopylae will be made the subject of the next chapter. The movements of the fleet are to be narrated in this.

In order distinctly to understand these movements, it is necessary that the reader should first have a clear conception of the geographical conformation of the coasts and seas along which the path of the expedition lay. By referring to the map of Greece, we shall see that the course which the fleet would naturally take from Therma to the southeastward, along the coast, was unobstructed and clear for about a hundred miles. We then come to a group of four islands, extending in a range at right angles to the coast. The only one of these islands with which we have particularly to do in this history is the innermost of them, which was named Sciathus. Opposite to these islands the line of the coast, having passed around the point of a mountainous and rocky promontory called Magnesia, turns suddenly to the westward, and runs in that direction for about thirty miles, when it again turns to the southward and eastward as before. In the sort of corner thus cut off by the deflection of the coast lies the long island of Euboea, which may be considered, in fact, as almost a continuation of the continent, as it is a part of the same conformation of country, and is separated from the main land only by submerged valleys on the north and on the east. Into these sunken valleys the sea of course flows, forming straits or channels. The one on the north was, in ancient times, called Artemisium, and the one on the west, at its narrowest point, Euripus. All these islands and coasts were high and picturesque. They were also, in the days of Xerxes, densely populated, and adorned profusely with temples, citadels, and towns.

On passing the southernmost extremity of the island of Euboea, and turning to the westward, we come to a promontory of the main land, which constituted Attica, and in the middle of which the city of Athens was situated. Beyond this is a capacious gulf, called the Saronian Gulf. It lies between Attica and the Peloponnesus. In the middle of the Saronian Gulf lies the island of AEgina, and in the northern part of it the island of Salamis. The progress of the Persian fleet was from Therma down the coast to Sciathus, thence along the shores of Euboea to its southern point, and so round into the Saronian Gulf to the island of Salamis. The distance of this voyage was perhaps two hundred and fifty miles. In accomplishing it the fleet encountered many dangers, and met with a variety of incidents and events, which we shall now proceed to describe.

The country, of course, was every where in a state of the greatest excitement and terror. The immense army was slowly coming down by land, and the fleet, scarcely less terrible, since its descents upon the coast would be so fearfully sudden and overwhelming when they were made, was advancing by sea. The inhabitants of the country were consequently in a state of extreme agitation. The sick and the infirm, who were, of course, utterly helpless in such a danger, exhibited every where the spectacle of silent dismay. Mothers, wives, maidens, and children, on the other hand, were wild with excitement and terror. The men, too full of passion to fear, or too full of pride to allow their fears to be seen, were gathering in arms, or hurrying to and fro with intelligence, or making hasty arrangements to remove their wives and children from the scenes of cruel suffering which were to ensue. They stationed watchmen on the hills to give warning of the approach of the enemy. They agreed upon signals, and raised piles of wood for beacon fires on every commanding elevation along the coast; while all the roads leading from the threatened provinces to other regions more remote from the danger were covered with flying parties, endeavoring to make their escape, and carrying, wearily and in sorrow, whatever they valued most and were most anxious to save. Mothers bore their children, men their gold and silver, and sisters aided their sick or feeble brothers to sustain the toil and terror of the flight.

All this time Xerxes was sitting in his war chariot, in the midst of his advancing army, full of exultation, happiness, and pride at the thoughts of the vast harvest of glory which all this panic and suffering were bringing him in.

The fleet, at length--which was under the command of Xerxes's brothers and cousins, whom he had appointed the admirals of it--began to move down the coast from Therma, with the intention of first sweeping the seas clear of any naval force which the Greeks might have sent forward there to act against them, and then of landing upon some point on the coast, wherever they could do so most advantageously for co-operation with the army on the land. The advance of the ships was necessarily slow. So

immense a flotilla could not have been otherwise kept together. The admirals, however, selected ten of the swiftest of the galleys, and, after manning and arming them in the most perfect manner, sent them forward to reconnoiter. The ten galleys were ordered to advance rapidly, but with the greatest circumspection. They were not to incur any needless danger, but, if they met with any detached ships of the enemy, they were to capture them, if possible. They were, moreover, to be constantly on the alert, to observe every thing, and to send back to the fleet all important intelligence which they could obtain.

The ten galleys went on without observing any thing remarkable until they reached the island of Sciathus. Here they came in sight of three Greek ships, a sort of advanced guard, which had been stationed there to watch the movements of the enemy.

The Greek galleys immediately hoisted their anchors and fled; the Persian galleys manned their oars, and pressed on after them.

They overtook one of the guard-ships very soon, and, after a short conflict, they succeeded in capturing it. The Persians made prisoners of the officers and crew, and then, selecting from among them the fairest and most noble-looking man, just as they would have selected a bullock from a herd, they sacrificed him to one of their deities on the prow of the captured ship. This was a religious ceremony, intended to signalize and sanctify their victory.

The second vessel they also overtook and captured. The crew of this ship were easily subdued, as the overwhelming superiority of their enemies appeared to convince them that all resistance was hopeless, and to plunge them into despair. There was one man, however, who, it seems, could not be conquered. He fought like a tiger to the last, and only ceased to deal his furious thrusts and blows at the enemies that surrounded him when, after being entirely covered with wounds, he fell faint and nearly lifeless upon the bloody deck. When the conflict with him was thus ended, the murderous hostility of his enemies seemed suddenly to be changed into pity for his sufferings and admiration of his valor. They gathered around him, bathed and bound up his wounds, gave him cordials, and at length restored him to life. Finally, when the detachment returned to the fleet, some days afterward, they carried this man with them, and presented him to the commanders as a hero worthy of the highest admiration and honor. The rest of the crew were made slaves.

The third of the Greek guard-ships contrived to escape, or, rather, the crew escaped, while the vessel itself was taken. This ship, in its flight, had gone toward the north, and the crew at last succeeded in running it on shore on the coast of Thessaly, so as to escape, themselves, by abandoning the vessel to the enemy. The officers and crew, thus escaping to the shore, went through Thessaly into Greece, spreading the tidings every where that the Persians were at hand. This intelligence was communicated, also, along the coast, by beacon fires which the people of Sciathus built upon the heights of the island as a signal, to give the alarm to the country southward of them, according to the preconcerted plan. The alarm was communicated by other fires built on other heights, and sentinels were stationed on every commanding eminence on the highlands of Euboea toward the south, to watch for the first appearance of the enemy.

The Persian galleys that had been sent forward having taken the three Greek guard-ships, and finding the sea before them now clear of all appearances of an enemy, concluded to return to the fleet with their prizes and their report. They had been directed, when they were dispatched from the fleet, to lay up a monument of stones at the furthest point which they should reach in their cruise: a measure often resorted to in similar cases, by way of furnishing proof that a party thus sent forward have really advanced as far as they pretend on their return. The Persian detachment had actually brought the stones for the erection of their landmark with them in one of their galleys. The galley containing the stones, and two others to aid it, pushed on beyond Sciathus to a small rocky islet standing in a conspicuous position in the sea, and there they built their monument or cairn. The detachment then returned to meet the fleet. The time occupied by this whole expedition was eleven days.

The fleet was, in the mean time, coming down along the coast of Magnesia. The whole company of ships had advanced safely and prosperously thus far, but now a great calamity was about to befall them--the first of the series of disasters by which the expedition was ultimately ruined. It was a storm at sea.

The fleet had drawn up for the night in a long and shallow bay on the coast. There was a rocky promontory at one end of this bay and a cape on the other, with a long beach between them. It was a very good place of refuge and rest for the night in calm weather, but such a bay afforded very little shelter against a tempestuous wind, or even against the surf and swell of the sea, which were sometimes produced by a distant storm. When the fleet entered this bay in the evening, the sea was calm and the sky serene. The commanders expected to remain there for the night, and to proceed on the voyage on the following day.

The bay was not sufficiently extensive to allow of the drawing up of so large a fleet in a single line along the shore. The ships were accordingly arranged in several lines, eight in all. The innermost of these lines was close to the shore; the others were at different distances from it, and every separate ship was held to the place assigned it by its anchors. In this position the fleet passed the night in safety, but before morning there were indications of a storm. The sky looked wild and lurid. A heavy swell came rolling in from the offing. The wind began to rise, and to blow in fitful gusts. Its direction was from the eastward, so that its tendency was to drive the fleet upon the shore. The seamen were anxious and afraid, and the commanders of the several ships began to devise, each for his own vessel, the best means of safety. Some, whose vessels were small, drew them up upon the sand, above the reach of the swell. Others strengthened the anchoring tackle, or added new anchors to those already down. Others raised their anchors altogether, and attempted to row their galleys away, up or down the coast, in hope of finding some better place of shelter. Thus all was excitement and confusion in the fleet, through the eager efforts made by every separate crew to escape the impending danger.

In the mean time, the storm came on apace. The rising and roughening sea made the oars useless, and the wind howled frightfully through the cordage and the rigging. The galleys soon began to be forced away from their moorings. Some were driven upon the beach and dashed to pieces by the waves. Some were wrecked on the rocks at one or the other of the projecting points which bounded the bay on either hand. Some foundered at their place of anchorage. Vast numbers of men were drowned. Those who escaped to the shore were in hourly dread of an attack from the inhabitants of the country. To save themselves, if possible, from this danger, they dragged up the fragments of the wrecked vessels upon the beach, and built a fort with them on the shore. Here they intrenched themselves, and then prepared to defend their lives, armed with the weapons which, like the materials for their fort, were washed up, from time to time, by the sea.

The storm continued for three days. It destroyed about three hundred galleys, besides an immense number of provision transports and other smaller vessels. Great numbers of seamen, also, were drowned. The inhabitants of the country along the coast enriched themselves with the plunder which they obtained from the wrecks, and from the treasures, and the gold and silver vessels, which continued for some time to be driven up upon the beach by the waves. The Persians themselves recovered, it was said, a great deal of valuable treasure, by employing a certain Greek diver, whom they had in their fleet, to dive for it after the storm was over. This diver, whose name was Scyllias, was famed far and wide for his power of remaining under water. As an instance of what they believed him capable of performing, they said that when, at a certain period subsequent to these transactions, he determined to desert to the Greeks, he accomplished his design by diving into the sea from the deck of a Persian galley, and coming up again in the midst of the Greek fleet, ten miles distant!

After three days the storm subsided. The Persians then repaired the damages which had been sustained, so far as it was now possible to repair them, collected what remained of the fleet, took the shipwrecked mariners from their rude fortification on the beach, and set sail again on their voyage to the southward.

In the mean time, the Greek fleet had assembled in the arm of the sea lying north of Euboea, and between Euboea and the main land. It was an allied fleet, made up of contributions from various states that had finally agreed to come into the confederacy. As is usually the case, however, with allied or confederate forces, they were not well agreed among themselves. The Athenians had furnished far the greater number of ships, and they considered themselves, therefore, entitled to the command; but the other allies were envious and jealous of them on account of that very superiority of wealth and power which enabled them to supply a greater portion of the naval force than the rest. They were willing that one of the Spartans should command, but they would not consent to put themselves under an Athenian. If an Athenian leader were chosen, they would disperse, they said, and the various portions of the fleet return to their respective homes.

The Athenians, though burning with resentment at this unjust declaration, were compelled to submit to the necessity of the case. They could not take the confederates at their word, and allow the fleet to be broken up, for the defense of Athens was the great object for which it was assembled. The other states might make their peace with the conqueror by submission, but the Athenians could not do so. In respect to the rest of Greece, Xerxes wished only for dominion. In respect to Athens, he wished for vengeance. The Athenians had burned the Persian city of Sardis, and he had determined to give himself no rest until he had burned Athens in return.

It was well understood, therefore, that the assembling of the fleet, and giving battle to the Persians where they now were, was a plan adopted mainly for the defense and benefit of the Athenians. The Athenians, accordingly, waived their claim to command, secretly resolving that, when the war was over, they would have their revenge for the insult and injury.

A Spartan was accordingly appointed commander of the fleet. His name was Eurybiades.

Things were in this state when the two fleets came in sight of each other in the strait between the northern end of Euboea and the main land. Fifteen of the Persian galleys, advancing incautiously some miles in front of the rest, came suddenly upon the Greek fleet, and were all captured. The crews were made prisoners and sent into Greece. The remainder of the fleet entered the strait, and anchored at the eastern extremity of it, sheltered by the promontory of Magnesia, which now lay to the north of them.

The Greeks were amazed at the immense magnitude of the Persian fleet, and the first opinion of the commanders was, that it was wholly useless for them to attempt to engage them. A council was convened, and, after a long and anxious debate, they decided that it was best to retire to the southward. The inhabitants of Euboea, who had been already in a state of great excitement and terror at the near approach of so formidable an enemy, were thrown, by this decision of the allies, into a state of absolute dismay. It was abandoning them to irremediable and hopeless destruction.

The government of the island immediately raised a very large sum of money, and went with it to Themistocles, one of the most influential of the Athenian leaders, and offered it to him if he would contrive any way to persuade the commanders of the fleet to remain and give the Persians battle where they were. Themistocles took the money, and agreed to the condition. He went with a small part of it--though this part was a very considerable sum--to Eurybiades, the commander-in-chief, and offered it to him if he would retain the fleet in its present position. There were some other similar offerings made to other influential men, judiciously selected. All this was done in a very private manner, and, of course, Themistocles took care to reserve to himself the lion's share of the Euboean contribution. The effect of this money in altering the opinions of the naval officers was marvelous. A new council was called, the former decision was annulled, and the Greeks determined to give their enemies battle where they were.

The Persians had not been unmindful of the danger that the Greeks might retreat by retiring through the Euripus, and so escape them. In order to prevent this, they secretly sent off a fleet of two hundred of their strongest and fleetest galleys, with orders to sail round Euboea and enter the Euripus from the south, so as to cut off the retreat of the Greeks in that quarter. They thought that by this plan the Greek fleet would be surrounded, and could have no possible mode of escape. They remained, therefore, with the principal fleet, at the outer entrance of the northern strait for some days, before attacking the Greeks, in order to give time for the detachment to pass round the island.

The Persians sent off the two hundred galleys with great secrecy, not desiring that the Greeks should discover their design of thus intercepting their retreat. They did discover it, however, for this was the occasion on which the great diver, Scyllias, made his escape from one fleet to the other by swimming under water ten miles, and he brought the Greeks the tidings.[E]

[Footnote E: There is reason to suppose that Scyllias made his escape by night in a boat, managing the circumstances, however, in such a way as to cause the story to be circulated that he swam.]

The Greeks dispatched a small squadron of ships with orders to proceed southward into the Euripus, to meet this detachment which the Persians sent round; and, in the mean time, they determined themselves to attack the main Persian fleet without any delay. Notwithstanding their absurd dissensions and jealousies, and the extent to which the leaders were influenced by intrigues and bribes, the Greeks always evinced an undaunted and indomitable spirit when the day of battle came. It was, moreover, in this case, exceedingly important to defend the position which they had taken. By referring to the map once more, it will be seen that the Euripus was the great highway to Athens by sea, as the pass of Thermopylae was by land. Thermopylae was west of Artemisium, where the fleet was now stationed, and not many miles from it. The Greek army had made its great stand at Thermopylae, and Xerxes was fast coming down the country with all his forces to endeavor to force a passage there. The Persian fleet, in entering Artemisium, was making the same attempt by sea in respect to the narrow passage of Euripus; and for either of the two forces, the fleet or the army, to fail of making good the defense of its position, without a desperate effort to do so, would justly be considered a base betrayal and abandonment of the other.

The Greeks therefore advanced, one morning, to the attack of the Persians, to the utter astonishment of the latter, who believed that their enemies were insane when they thus saw them coming into the jaws, as they thought, of certain destruction. Before night, however, they were to change their opinions in respect to the insanity of their foes. The Greeks pushed boldly on into the midst of the Persian fleet, where they were soon surrounded. They then formed themselves into a circle, with the prows of the vessels outward, and the sterns toward the center within, and fought in this manner with the utmost desperation all the day. With the night a storm came on, or, rather, a series of thunder-showers and gusts of wind, so severe that both fleets were glad to retire from the scene of contest. The Persians went back toward the east, the Greeks to the westward, toward Thermopylae--each party busy in

repairing their wrecks, taking care of their wounded, and saving their vessels from the tempest. It was a dreadful night. The Persians, particularly, spent it in the midst of scenes of horror. The wind and the current, it seems, set outward, toward the sea, and carried the masses and fragments of the wrecked vessels, and the swollen and ghastly bodies of the dead, in among the Persian fleet, and so choked up the surface of the water that the oars became entangled and useless. The whole mass of seamen in the Persian fleet, during this terrible night, were panic-stricken and filled with horror. The wind, the perpetual thunder, the concussions of the vessels with the wrecks and with one another, and the heavy shocks of the seas, kept them in continual alarm; and the black and inscrutable darkness was rendered the more dreadful, while it prevailed, by the hideous spectacle which, at every flash of lightning, glared brilliantly upon every eye from the wide surface of the sea. The shouts and cries of officers vociferating orders, of wounded men writhing in agony, of watchmen and sentinels in fear of collisions, mingled with the howling wind and roaring seas, created a scene of indescribable terror and confusion.

The violence of the sudden gale was still greater further out at sea, and the detachment of ships which had been sent around Euboea was wholly dispersed and destroyed by it.

The storm was, however, after all, only a series of summer evening showers, such as to the inhabitants of peaceful dwellings on the land have no terror, but only come to clear the sultry atmosphere in the night, and in the morning are gone. When the sun rose, accordingly, upon the Greeks and Persians on the morning after their conflict, the air was calm, the sky serene, and the sea as blue and pure as ever. The bodies and the wrecks had been floated away into the offing. The courage or the ferocity, whichever we choose to call it, of the combatants, returned, and they renewed the conflict. It continued, with varying success, for two more days.

During all this time the inhabitants of the island of Euboea were in the greatest distress and terror. They watched these dreadful conflicts from the heights, uncertain how the struggle would end, but fearing lest their defenders should be beaten, in which case the whole force of the Persian fleet would be landed on their island, to sweep it with pillage and destruction. They soon began to anticipate the worst, and, in preparation for it, they removed their goods--all that could be removed--and drove their cattle down to the southern part of the island, so as to be ready to escape to the main land. The Greek commanders, finding that the fleet would probably be compelled to retreat in the end, sent to them here, recommending that they should kill their cattle and eat them, roasting the flesh at fires which they should kindle on the plain. The cattle could not be transported, they said, across the channel, and it was better that the flying population should be fed, than that the food should fall into Persian hands. If they would dispose of their cattle in this manner, Eurybiades would endeavor, he said, to transport the people themselves and their valuable goods across into Attica.

How many thousand peaceful and happy homes were broken up and destroyed forever by this ruthless invasion!

In the mean time, the Persians, irritated by the obstinate resistance of the Greeks, were, on the fourth day, preparing for some more vigorous measures, when they saw a small boat coming toward the fleet from down the channel. It proved to contain a countryman, who came to tell them that the Greeks had gone away. The whole fleet, he said, had sailed off to the southward, and abandoned those seas altogether. The Persians did not, at first, believe this intelligence. They suspected some ambuscade or stratagem. They advanced slowly and cautiously down the channel. When they had gone half down to Thermopylae, they stopped at a place called Histiaea, where, upon the rocks on the shore, they found an inscription addressed to the Ionians--who, it will be recollected, had been brought by Xerxes as auxiliaries, contrary to the advice of Artabanus--entreating them not to fight against their countrymen. This inscription was written in large and conspicuous characters on the face of the cliff, so that it could be read by the Ionian seamen as they passed in their galleys.

The fleet anchored at Histiaea, the commanders being somewhat uncertain in respect to what it was best to do. Their suspense was very soon relieved by a messenger from Xerxes, who came in a galley up the channel from Thermopylae, with the news that Xerxes had arrived at Thermopylae, had fought a great battle there, defeated the Greeks, and obtained possession of the pass, and that any of the officers of the fleet who chose to do so might come and view the battle ground. This intelligence and invitation produced, throughout the fleet, a scene of the wildest excitement, enthusiasm, and joy. All the boats and smaller vessels of the fleet were put into requisition to carry the officers down. When they arrived at Thermopylae the tidings all proved true. Xerxes was in possession of the pass, and the Greek fleet was gone.

CHAPTER IX.

THE BATTLE OF THERMOPYLAE.

B.C. 480

The pass of Thermopylae.--Its situation.--Ancient intrenchments.--View at Thermopylae.--The allied forces.--Leonidas the Spartan.--Debate in regard to defending Thermopylae.--The decision.--Character of the Spartans.--Their pride.--The Spartans adorn themselves for the battle.--Approach of Xerxes.--The Persian horseman.--His observation.--Report of the horseman.--Conversation with Demaratus.--Xerxes encamps at the pass.--Troops sent into the pass.--Defeat of the Persian detachment.--The Immortals called out.--The Immortals advance to the charge.--Valor of the Greeks.--The Immortals repulsed.--Treachery of Ephialtes.--Joy of Xerxes.--Course of the path.--A Persian detachment sent up the path.--The Phocaeans retreat.--The Greeks surrounded.--Resolution of Leonidas.--Leonidas dismisses the other Greeks.--His noble generosity.--Leonidas retains the Thebans.--Xerxes attacks him.--Terrible combat.--Death of Leonidas.--Stories of the battle.--The two invalids.--Xerxes views the ground.--His treatment of the body of Leonidas.--Message to the fleet.--Xerxes sends for Demaratus.--Conversation with Demaratus.--Plans proposed by him.--Opposition of the admiral.--Decision of Xerxes.

The pass of Thermopylae was not a ravine among mountains, but a narrow space between mountains and the sea. The mountains landward were steep and inaccessible; the sea was shoal. The passage between them was narrow for many miles along the shore, being narrowest at the ingress and egress. In the middle the space was broader. The place was celebrated for certain warm springs which here issued from the rocks, and which had been used in former times for baths.

The position had been considered, long before Xerxes's day, a very important one in a military point of view, as it was upon the frontier between two Greek states that were frequently at war. One of these states, of course, was Thessaly. The other was Phocis, which lay south of Thessaly. The general boundary between these two states was mountainous, and impassable for troops, so that each could invade the territories of the other only by passing round between the mountains and the shore at Thermopylae.

The Phocaeans, in order to keep the Thessalians out, had, in former times, built a wall across the way, and put up gates there, which they strongly fortified. In order still further to increase the difficulty of forcing a passage, they conducted the water of the warm springs over the ground without the wall, in such a way as to make the surface continually wet and miry. The old wall had now fallen to ruins, but the miry ground remained. The place was solitary and desolate, and overgrown with a confused and wild vegetation. On one side the view extended far and wide over the sea, with the highlands of Euboea in the distance, and on the other dark and inaccessible mountains rose, covered with forests, indented with mysterious and unexplored ravines, and frowning in a wild and gloomy majesty over the narrow passway which crept along the shore below.

The Greeks, when they retired from Thessaly, fell back upon Thermopylae, and established themselves there. They had a force variously estimated, from three to four thousand men. These were from the different states of Greece, some within and some without the Peloponnesus--a few hundred men only being furnished, in general, from each state or kingdom. Each of these bodies of troops had its own officers, though there was one general-in-chief, who commanded the whole. This was Leonidas the Spartan. He had brought with him three hundred Spartans, as the quota furnished by that city. These men he had specially selected himself, one by one, from among the troops of the city, as men on whom he could rely.

It will be seen from the map that Thermopylae is at some distance from the Isthmus of Corinth, and that of the states which would be protected by making a stand at the pass, some were without the isthmus and some within. These states, in sending each a few hundred men only to Thermopylae, did not consider that they were making their full contribution to the army, but only sending forward for the emergency those that could be dispatched at once; and they were all making arrangements to supply more troops as soon as they could be raised and equipped for the service. In the mean time, however, Xerxes and his immense hordes came on faster than they had expected, and the news at length came to Leonidas, in the pass, that the Persians, with one or two millions of men, were at hand, while he had only three or four thousand at Thermopylae to oppose them. The question arose, What was to be done?

Those of the Greeks who came from the Peloponnesus were in favor of abandoning Thermopylae, and falling back to the isthmus. The isthmus, they maintained, was as strong and as favorable a position as the place where they were; and, by the time they had reached it, they would have received great re-enforcements; whereas, with so small a force as they had then at command, it was madness to attempt to resist the Persian millions. This plan, however, was strongly opposed by all those Greeks who represented countries _without_ the Peloponnesus; for, by abandoning Thermopylae, and falling back to the isthmus, their states would be left wholly at the mercy of the enemy. After some consultation and debate, it was decided to remain at Thermopylae. The troops accordingly took up their positions in a deliberate and formal manner, and, intrenching themselves as strongly as possible, began to

await the onset of the enemy. Leonidas and his three hundred were foremost in the defile, so as to be the first exposed to the attack. The rest occupied various positions along the passage, except one corps, which was stationed on the mountains above, to guard the pass in that direction. This corps was from Phocis, which, being the state nearest to the scene of conflict, had furnished a larger number of soldiers than any other. Their division numbered a thousand men. These being stationed on the declivity of the mountain, left only two or three thousand in the defile below.

From what has been said of the stern and savage character of the Spartans, one would scarcely expect in them any indications or displays of personal vanity. There was one particular, it seems, however, in regard to which they were vain, and that was in respect to their hair. They wore it very long. In fact, the length of the hair was, in their commonwealth, a mark of distinction between freemen and slaves. All the agricultural and mechanical labors were performed, as has already been stated, by the slaves, a body which constituted, in fact, the mass of the population; and the Spartan freemen, though very stern in their manners, and extremely simple and plain in their habits of life, were, it must be remembered, as proud and lofty in spirit as they were plain and poor. They constituted a military aristocracy, and a military aristocracy is always more proud and overbearing than any other.

It must be understood, therefore, that these Spartan soldiers were entirely above the performance of any useful labors; and while they prized, in character, the savage ferocity of the tiger, they had a taste, in person, for something like his savage beauty too. They were never, moreover, more particular and careful in respect to their personal appearance than when they were going into battle. The field of battle was their particular theater of display, not only of the substantial qualities of strength, fortitude, and valor, but also of such personal adornments as were consistent with the plainness and severity of their attire, and could be appreciated by a taste as rude and savage as theirs. They proceeded, therefore, when established at their post in the throat of the pass, to adorn themselves for the approaching battle.

In the mean time the armies of Xerxes were approaching. Xerxes himself, though he did not think it possible that the Greeks could have a sufficient force to offer him any effectual resistance, thought it probable that they would attempt to make a stand at the pass, and, when he began to draw near to it, he sent forward a horseman to reconnoiter the ground. The horseman rode into the pass a little way, until he came in sight of the enemy. He stopped upon an eminence to survey the scene, being all ready to turn in an instant, and fly at the top of his speed, in case he should be pursued. The Spartans looked upon him as he stood there, but seemed to consider his appearance as a circumstance of no moment, and then went on with their avocations. The horseman found, as he leisurely observed them, that there was an intrenchment thrown across the straits, and that the Spartans were in front of it. There were other forces behind, but these the horseman could not see. The Spartans were engaged, some of them in athletic sports and gymnastic exercises, and the rest in nicely arranging their dress, which was red and showy in color, though simple and plain in form, and in smoothing, adjusting, and curling their hair. In fact, they seemed to be, one and all, preparing for an entertainment.

And yet these men were actually preparing themselves to be slaughtered, to be butchered, one by one, by slow degrees, and in the most horrible and cruel manner; and they knew perfectly well that it was so. The adorning of themselves was for this express and particular end.

The horseman, when he had attentively noticed all that was to be seen, rode slowly back to Xerxes, and reported the result. The king was much amused at hearing such an account from his messenger. He sent for Demaratus, the Spartan refugee, with whom, the reader will recollect, he held a long conversation in respect to the Greeks at the close of the great review at Doriscus. When Demaratus came, Xerxes related to him what the messenger had reported. "The Spartans in the pass," said he, "present, in their encampment, the appearance of being out on a party of pleasure. What does it mean? You will admit now, I suppose, that they do not intend to resist us."

Demaratus shook his head. "Your majesty does not know the Greeks," said he, "and I am very much afraid that, if I state what I know respecting them, I shall offend you. These appearances which your messenger observed indicate to me that the men he saw were a body of Spartans, and that they supposed themselves on the eve of a desperate conflict. Those are the men, practicing athletic feats, and smoothing and adorning their hair, that are the most to be feared of all the soldiers of Greece. If you can conquer them, you will have nothing beyond to fear."

Xerxes thought this opinion of Demaratus extremely absurd. He was convinced that the party in the pass was some small detachment that could not possibly be thinking of serious resistance. They would, he was satisfied, now that they found that the Persians were at hand, immediately retire down the pass, and leave the way clear. He advanced, therefore, up to the entrance of the pass, encamped there, and waited several days for the Greeks to clear the way. The Greeks remained quietly in their places,

paying apparently no attention whatever to the impending and threatening presence of their formidable foes.

At length Xerxes concluded that it was time for him to act. On the morning, therefore, of the fifth day, he called out a detachment of his troops, sufficient, as he thought, for the purpose, and sent them down the pass, with orders to seize all the Greeks that were there, and bring them, _alive_, to him. The detachment that he sent was a body of Medes, who were considered as the best troops in the army, excepting always the Immortals, who, as has been before stated, were entirely superior to the rest. The Medes, however, Xerxes supposed, would find no difficulty in executing his orders.

The detachment marched, accordingly, into the pass. In a few hours a spent and breathless messenger came from them, asking for re-enforcements. The re-enforcements were sent. Toward night a remnant of the whole body came back, faint and exhausted with a long and fruitless combat, and bringing many of their wounded and bleeding comrades with them. The rest they had left dead in the defile.

Xerxes was both astonished and enraged at these results. He determined that this trifling should continue no longer. He ordered the Immortals themselves to be called out on the following morning, and then, placing himself at the head of them, he advanced to the vicinity of the Greek intrenchments. Here he ordered a seat or throne to be placed for him upon an eminence, and, taking his seat upon it, prepared to witness the conflict. The Greeks, in the mean time, calmly arranged themselves on the line which they had undertaken to defend, and awaited the charge. Upon the ground, on every side, were lying the mangled bodies of the Persians slain the day before, some exposed fully to view, ghastly and horrid spectacles, others trampled down and half buried in the mire.

The Immortals advanced to the attack, but they made no impression. Their superior numbers gave them no advantage, on account of the narrowness of the defile. The Greeks stood, each corps at its own assigned station on the line, forming a mass so firm and immovable that the charge of the Persians was arrested on encountering it as by a wall. In fact, as the spears of the Greeks were longer than those of the Persians, and their muscular and athletic strength and skill were greater, it was found that in the desperate conflict which raged, hour after hour, along the line, the Persians were continually falling, while the Greek ranks continued entire. Sometimes the Greeks would retire for a space, falling back with the utmost coolness, regularity, and order; and then, when the Persians pressed on in pursuit, supposing that they were gaining the victory, the Greeks would turn so soon as they found that the ardor of pursuit had thrown the enemies' lines somewhat into confusion, and, presenting the same firm and terrible front as before, would press again upon the offensive, and cut down their enemies with redoubled slaughter. Xerxes, who witnessed all these things from among the group of officers around him upon the eminence, was kept continually in a state of excitement and irritation. Three times he leaped from his throne, with loud exclamations of vexation and rage.

All, however, was of no avail. When night came the Immortals were compelled to withdraw, and leave the Greeks in possession of their intrenchments.

Things continued substantially in this state for one or two days longer, when one morning a Greek countryman appeared at the tent of Xerxes, and asked an audience of the king. He had something, he said, of great importance to communicate to him. The king ordered him to be admitted. The Greek said that his name was Ephialtes, and that he came to inform the king that there was a secret path leading along a wild and hidden chasm in the mountains, by which he could guide a body of Persians to the summit of the hills overhanging the pass at a point below the Greek intrenchment. This point being once attained, it would be easy, Ephialtes said, for the Persian forces to descend into the pass below the Greeks, and thus to surround them and shut them in, and that the conquest of them would then be easy. The path was a secret one, and known to very few. He knew it, however, and was willing to conduct a detachment of troops through it, on condition of receiving a suitable reward.

The king was greatly surprised and delighted at this intelligence. He immediately acceded to Ephialtes's proposals, and organized a strong force to be sent up the path that very night.

On the north of Thermopylae there was a small stream, which came down through a chasm in the mountains to the sea. The path which Ephialtes was to show commenced here, and following the bed of this stream up the chasm, it at length turned to the southward through a succession of wild and trackless ravines, till it came out at last on the declivities of the mountains near the lower part of the pass, at a place where it was possible to descend to the defile below. This was the point which the thousand Phocaeans had been ordered to take possession of and guard, when the plan for the defense of the pass was first organized. They were posted here, not with the idea of repelling any attack from the mountains behind them--for the existence of the path was wholly unknown to them--but only that they might command the defile below, and aid in preventing the Persians from going through, even if those who were in the defile were defeated or slain.

The Persian detachment toiled all night up the steep and dangerous pathway, among rocks, chasms, and precipices, frightful by day, and now made still more frightful by the gloom of the night. They came out at last, in the dawn of the morning, into valleys and glens high up the declivity of the mountain, and in the immediate vicinity of the Phocaean encampment. The Persians were concealed, as they advanced, by the groves and thickets of stunted oaks which grew here, but the morning air was so calm and still, that the Phocaean sentinels heard the noise made by their trampling upon the leaves as they came up the glen. The Phocaeans immediately gave the alarm. Both parties were completely surprised. The Persians had not expected to find a foe at this elevation, and the Greeks who had ascended there had supposed that all beyond and above them was an impassable and trackless desolation.

There was a short conflict, The Phocaeans were driven off their ground. They retreated up the mountain, and toward the southward. The Persians decided not to pursue them. On the other hand, they descended toward the defile, and took up a position on the lower declivities of the mountain, which enabled them to command the pass below; there they paused, and awaited Xerxes's orders.

The Greeks in the defile perceived at once that they were now wholly at the mercy of their enemies. They might yet retreat, it is true, for the Persian detachment had not yet descended to intercept them; but, if they remained where they were, they would, in a few hours, be hemmed in by their foes; and even if they could resist, for a little time, the double onset which would then be made upon them, their supplies would be cut off, and there would be nothing before them but immediate starvation. They held hurried councils to determine what to do.

There is some doubt as to what took place at these councils, though the prevailing testimony is, that Leonidas recommended that they should retire--that is, that all except himself and the three hundred Spartans should do so. "You," said he, addressing the other Greeks, "are at liberty, by your laws, to consider, in such cases as this, the question of expediency, and to withdraw from a position which you have taken, or stand and maintain it, according as you judge best. But by our laws, such a question, in such a case, is not to be entertained. Wherever we are posted, there we stand, come life or death, to the end. We have been sent here from Sparta to defend the pass of Thermopylae. We have received no orders to withdraw. Here, therefore, we must remain; and the Persians, if they go through the pass at all, must go through it over our graves. It is, therefore, your duty to retire. Our duty is here, and we will remain and do it."

After all that may be said of the absurdity and folly of throwing away the lives of three hundred men in a case like this, so utterly and hopelessly desperate, there is still something in the noble generosity with which Leonidas dismissed the other Greeks, and in the undaunted resolution with which he determined himself to maintain his ground, which has always strongly excited the admiration of mankind. It was undoubtedly carrying the point of honor to a wholly unjustifiable extreme, and yet all the world, for the twenty centuries which have intervened since these transactions occurred, while they have unanimously disapproved, in theory, of the course which Leonidas pursued, have none the less unanimously admired and applauded it.

In dismissing the other Greeks, Leonidas retained with him a body of Thebans, whom he suspected of a design of revolting to the enemy. Whether he considered his decision to keep them in the pass equivalent to a sentence of death, and intended it as a punishment for their supposed treason, or only that he wished to secure their continued fidelity by keeping them closely to their duty, does not appear. At all events, he retained them, and dismissed the other allies. Those dismissed retreated to the open country below. The Spartans and the Thebans remained in the pass. There were also, it was said, some other troops, who, not willing to leave the Spartans alone in this danger, chose to remain with them and share their fate. The Thebans remained very unwillingly.

The next morning Xerxes prepared for his final effort. He began by solemn religious services, in the presence of his army, at an early hour; and then, after breakfasting quietly, as usual, and waiting, in fact, until the business part of the day had arrived, he gave orders to advance. His troops found Leonidas and his party not at their intrenchments, as before, but far in advance of them. They had come out and forward into a more open part of the defile, as if to court and anticipate their inevitable and dreaded fate. Here a most terrible combat ensued; one which, for a time, seemed to have no other object than mutual destruction, until at length Leonidas himself fell, and then the contest for the possession of his body superseded the unthinking and desperate struggles of mere hatred and rage. Four times the body, having been taken by the Persians, was retaken by the Greeks: at last the latter retreated, bearing the dead body with them past their intrenchment, until they gained a small eminence in the rear of it, at a point where the pass was wider. Here the few that were still left gathered together. The detachment which Ephialtes had guided were coming up from below. The Spartans were faint and exhausted with their desperate efforts, and were bleeding from the wounds

they had received; their swords and spears were broken to pieces, their leader and nearly all their company were slain. But the savage and tiger-like ferocity which animated them continued unabated till the last. They fought with tooth and nail when all other weapons failed them, and bit the dust at last, as they fell, in convulsive and unyielding despair. The struggle did not cease till they were all slain, and every limb of every man ceased to quiver.

There were stories in circulation among mankind after this battle, importing that one or two of the corps escaped the fate of the rest. There were two soldiers, it was said, that had been left in a town near the pass, as invalids, being afflicted with a severe inflammation of the eyes. One of them, when he heard that the Spartans were to be left in the pass, went in, of his own accord, and joined them, choosing to share the fate of his comrades. It was said that he ordered his servant to conduct him to the place. The servant did so, and then fled himself, in great terror. The sick soldier remained and fought with the rest. The other of the invalids was saved, but, on his return to Sparta, he was considered as stained with indelible disgrace for what his countrymen regarded a base dereliction from duty in not sharing his comrade's fate.

There was also a story of another man, who had been sent away on some mission into Thessaly, and who did not return until all was over; and also of two others who had been sent to Sparta, and were returning when they heard of the approaching conflict. One of them hastened into the pass, and was killed with his companions. The other delayed, and was saved. Whether any or all of these rumors were true, is not now certain; there is, however, no doubt that, with at most a few exceptions such as these, the whole three hundred were slain.

The Thebans, early in the conflict, went over in a body to the enemy.

Xerxes came after the battle to view the ground. It was covered with many thousands of dead bodies, nearly all of whom, of course, were Persians. The wall of the intrenchment was broken down, and the breaches in it choked up by the bodies. The morasses made by the water of the springs were trampled into deep mire, and were full of the mutilated forms of men and of broken weapons. When Xerxes came at last to the body of Leonidas, and was told that that was the man who had been the leader of the band, he gloried over it in great exaltation and triumph. At length he ordered the body to be decapitated, and the headless trunk to be nailed to a cross.

Xerxes then commanded that a great hole should be dug, and ordered all the bodies of the Persians that had been killed to be buried in it, except only about a thousand, which he left upon the ground. The object of this was to conceal the extent of the loss which his army had sustained. The more perfectly to accomplish this end, he caused the great grave, when it was filled up, to be strewed over with leaves, so as to cover and conceal all indications of what had been done. This having been carefully effected, he sent the message to the fleet, which was alluded to at the close of the last chapter, inviting the officers to come and view the ground.

The operations of the fleet described in the last chapter, and those of the army narrated in this, took place, it will be remembered, at the same time, and in the same vicinity too; for, by referring to the map, it will appear that Thermopylae was upon the coast, exactly opposite to the channel or arm of the sea lying north of Euboea, where the naval contests had been waged; so that, while Xerxes had been making his desperate efforts to get through the pass, his fleet had been engaged in a similar conflict with the squadrons of the Greeks, directly opposite to him, twenty or thirty miles in the offing.

After the battle of Thermopylae was over, Xerxes sent for Demaratus, and inquired of him how many more such soldiers there were in Greece as Leonidas and his three hundred Spartans. Demaratus replied that he could not say how many precisely there were in Greece, but that there were eight thousand such in Sparta alone. Xerxes then asked the opinion of Demaratus as to the course best to be pursued for making the conquest of the country. This conversation was held in the presence of various nobles and officers, among whom was the admiral of the fleet, who had come, with the various other naval commanders, as was stated in the last chapter, to view the battle-field.

Demaratus said that he did not think that the king could easily get possession of the Peloponnesus by marching to it directly, so formidable would be the opposition that he would encounter at the isthmus. There was, however, he said, an island called Cythera, opposite to the territories of Sparta, and not far from the shore, of which he thought that the king could easily get possession, and which, once fully in his power, might be made the base of future operations for the reduction of the whole peninsula, as bodies of troops could be dispatched from it to the main land in any numbers and at any time. He recommended, therefore, that three hundred ships, with a proper complement of men, should be detached from the fleet, and sent round at once to take possession of that island.

To this plan the admiral of the fleet was totally opposed. It was natural that he should be so, since the detaching of three hundred ships for this enterprise would greatly weaken the force under his command. It would leave the fleet, he told the king, a miserable remnant, not superior to that of the enemy, for they had already lost four hundred ships by storms. He thought it infinitely preferable that the fleet and the army should advance together, the one by sea and the other on the land, and complete their conquests as they went along. He advised the king, too, to beware of Demaratus's advice. He was a Greek, and, as such, his object was, the admiral believed, to betray and ruin the expedition.

After hearing these conflicting opinions, the king decided to follow the admiral's advice. "I will adopt your counsel," said he, "but I will not hear any thing said against Demaratus, for I am convinced that he is a true and faithful friend to me." Saying this, he dismissed the council.

CHAPTER X.

THE BURNING OF ATHENS.

B.C. 480

The officers return to their vessels.--The Greek fleet retire to Salamis.--The Thessalians.--Their hostility to the Phocaeans.--Defeat of the Thessalians.--Phocaean stratagem.--A spectral army.--Thessalian cavalry.--Pitfall for the cavalry.--They are caught in it.--Advance of the army.--Cruelties and atrocities.--The sacred town of Delphi.--Mount Parnassus.--Summit of Parnassus.--The Castalian spring.--The oracle.--Architectural structures.--Works of art.--Inspiration of the oracle.--Its discovery.--Panic of the Delphians.--They apply to the oracle.--Response of the oracle.--The prodigy in the temple.--Discomfiture of the Persians.--The spirit warriors.--Consternation at Athens.--The inhabitants advised to fly.--Scenes of misery.--Some of the inhabitants remain.--Situation of the Acropolis.--Magnificent architectural structures.--Statue of Minerva.--The Parthenon.--Xerxes at Athens.--Athens burned.--The citadel taken and fired.--Exaltation of Xerxes.--Messenger sent to Susa.

When the officers of the Persian fleet had satisfied themselves with examining the battle-field at Thermopylae, and had heard the narrations given by the soldiers of the terrible combats that had been fought with the desperate garrison which had been stationed to defend the pass, they went back to their vessels, and prepared to make sail to the southward, in pursuit of the Greek fleet. The Greek fleet had gone to Salamis. The Persians in due time overtook them there, and a great naval conflict occurred, which is known in history as the battle of Salamis, and was one of the most celebrated naval battles of ancient times. An account of this battle will form the subject of the next chapter. In this we are to follow the operations of the army on the land.

As the Pass of Thermopylae was now in Xerxes's possession, the way was open before him to all that portion of the great territory which lay north of the Peloponnesus. Of course, before he could enter the peninsula itself, he must pass the Isthmus of Corinth, where he might, perhaps, encounter some concentrated resistance. North of the isthmus, however, there was no place where the Greeks could make a stand. The country was all open, or, rather, there were a thousand ways open through the various valleys and glens, and along the banks of the rivers. All that was necessary was to procure guides and proceed.

The Thessalians were very ready to furnish guides. They had submitted to Xerxes before the battle of Thermopylae, and they considered themselves, accordingly, as his allies. They had, besides, a special interest in conducting the Persian army, on account of the hostile feelings which they entertained toward the people immediately south of the pass, into whose territories Xerxes would first carry his ravages. This people were the Phocaeans. Their country, as has already been stated, was separated from Thessaly by impassable mountains, except where the Straits of Thermopylae opened a passage; and through this pass both nations had been continually making hostile incursions into the territory of the other for many years before the Persian invasion. The Thessalians had surrendered readily to the summons of Xerxes, while the Phocaeans had determined to resist him, and adhere to the cause of the Greeks in the struggle. They were suspected of having been influenced, in a great measure, in their determination to resist, by the fact that the Thessalians had decided to surrender. They were resolved that they would not, on any account, be upon the same side with their ancient and inveterate foes.

The hostility of the Thessalians to the Phocaeans was equally implacable. At the last incursion which they had made into the Phocaean territory, they had been defeated by means of stratagems in a manner which tended greatly to vex and irritate them. There were two of these stratagems, which were both completely successful, and both of a very extraordinary character.

The first was this. The Thessalians were in the Phocaean country in great force, and the Phocaeans had found themselves utterly unable to expel them. Under these circumstances, a body of the Phocaeans, six hundred in number, one day whitened their faces, their arms and hands, their clothes, and all their weapons, with chalk, and then, at the dead of night--perhaps, however, when the moon was shining--made an onset upon the camp of the enemy. The Thessalian sentinels were terrified and ran away, and the soldiers, awakened from their slumbers by these unearthly-looking troops, screamed with fright, and fled in all directions, in utter confusion and dismay. A night attack is usually a dangerous attempt, even if the assaulting party is the strongest, as, in the darkness and confusion which then prevail, the assailants can not ordinarily distinguish friends from foes, and so are in great danger, amid the tumult and obscurity, of slaying one another. That difficulty was obviated in this case by the strange disguise which the Phocaeans had assumed. They knew that all were Thessalians who were not whitened like themselves. The Thessalians were totally discomfited and dispersed by this encounter.

The other stratagem was of a different character, and was directed against a troop of cavalry. The Thessalian cavalry were renowned throughout the world. The broad plains extending through the heart of their country contained excellent fields for training and exercising such troops, and the mountains which surrounded it furnished grassy slopes and verdant valleys, that supplied excellent pasturage for the rearing of horses. The nation was very strong, therefore, in this species of force, and many of the states and kingdoms of Greece, when planning their means of internal defense, and potentates and conquerors, when going forth on great campaigns, often considered their armies incomplete unless there was included in them a corps of Thessalian cavalry.

A troop of this cavalry had invaded Phocis, and the Phocaeans, conscious of their inability to resist them in open war, contrived to entrap them in the following manner. They dug a long trench in the ground, and then putting in baskets or casks sufficient nearly to fill the space, they spread over the top a thin layer of soil. They then concealed all indications that the ground had been disturbed, by spreading leaves over the surface. The trap being thus prepared, they contrived to entice the Thessalians to the spot by a series of retreats, and at length led them into the pitfall thus provided for them. The substructure of casks was strong enough to sustain the Phocaeans, who went over it as footmen, but was too fragile to bear the weight of the mounted troops. The horses broke through, and the squadron was thrown into such confusion by so unexpected a disaster, that, when the Phocaeans turned and fell upon them, they were easily overcome.

These things had irritated and vexed the Thessalians very much. They were eager for revenge, and they were very ready to guide the armies of Xerxes into the country of their enemies in order to obtain it.

The troops advanced accordingly, awakening every where, as they came on, the greatest consternation and terror among the inhabitants, and producing on all sides scenes of indescribable anguish and suffering. They came into the valley of the Cephisus, a beautiful river flowing through a delightful and fertile region, which contained many cities and towns, and was filled every where with an industrious rural population. Through this scene of peace, and happiness, and plenty, the vast horde of invaders swept on with the destructive force of a tornado. They plundered the towns of every thing which could be carried away, and destroyed what they were compelled to leave behind them. There is a catalogue of twelve cities in this valley which they burned. The inhabitants, too, were treated with the utmost cruelty. Some were seized, and compelled to follow the army as slaves; others were slain; and others still were subjected to nameless cruelties and atrocities, worse sometimes than death. Many of the women, both mothers and maidens, died in consequence of the brutal violence with which the soldiers treated them.

The most remarkable of the transactions connected with Xerxes's advance through the country of Phocis, on his way to Athens, were those connected with his attack upon Delphi. Delphi was a sacred town, the seat of the oracle. It was in the vicinity of Mount Parnassus and of the Castalian spring, places of very great renown in the Greek mythology.

Parnassus was the name of a short mountainous range rather than of a single peak, though the loftiest summit of the range was called Parnassus too. This summit is found, by modern measurement, to be about eight thousand feet high, and it is covered with snow nearly all the year. When bare it consists only of a desolate range of rocks, with mosses and a few Alpine plants growing on the sheltered and sunny sides of them. From the top of Parnassus travelers who now visit it look down upon almost all of Greece as upon a map. The Gulf of Corinth is a silver lake at their feet, and the plains of Thessaly are seen extending far and wide to the northward, with Olympus, Pelion, and Ossa, blue and distant peaks, bounding the view.

Parnassus has, in fact, a double summit, between the peaks of which a sort of ravine commences, which, as it extends down the mountain, becomes a beautiful valley, shaded with rows of trees, and adorned with slopes of verdure and banks of flowers. In a glen connected with this valley there is a fountain of water springing copiously from among the rocks, in a grove of laurels. This

fountain gives rise to a stream, which, after bounding over the rocks, and meandering between mossy banks for a long distance down the mountain glens, becomes a quiet lowland stream, and flows gently through a fertile and undulating country to the sea. This fountain was the famous Castalian spring. It was, as the ancient Greek legends said, the favorite resort and residence of Apollo and the Muses, and its waters became, accordingly, the symbol and the emblem of poetical inspiration.

The city of Delphi was built upon the lower declivities of the Parnassian ranges, and yet high above the surrounding country. It was built in the form of an amphitheater, in a sort of _lap_ in the hill where it stood, with steep precipices descending to a great depth on either side. It was thus a position of difficult access, and was considered almost impregnable in respect to its military strength. Besides its natural defenses, it was considered as under the special protection of Apollo.

Delphi was celebrated throughout the world, in ancient times, not only for the oracle itself, but for the magnificence of the architectural structures, the boundless profusion of the works of art, and the immense value of the treasures which, in process of time, had been accumulated there. The various powers and potentates that had resorted to it to obtain the responses of the oracle, had brought rich presents, or made costly contributions in some way, to the service of the shrine. Some had built temples, others had constructed porches or colonnades. Some had adorned the streets of the city with architectural embellishments; others had caused statues to be erected; and others had made splendid donations of vessels of gold and silver, until at length the wealth and magnificence of Delphi was the wonder of the world. All nations resorted to it, some to see its splendors, and others to obtain the counsel and direction of the oracle in emergencies of difficulty or danger.

In the time of Xerxes, Delphi had been for several hundred years in the enjoyment of its fame as a place of divine inspiration. It was said to have been originally discovered in the following manner. Some herdsmen on the mountains, watching their flocks, observed one day a number of goats performing very strange and unaccountable antics among some crevices in the rocks, and, going to the place, they found that a mysterious wind was issuing from the crevices, which produced an extraordinary exhilaration on all who breathed it. Every thing extraordinary was thought, in those days, to be supernatural and divine, and the fame of this discovery was spread every where, the people supposing that the effect produced upon the men and animals by breathing the mysterious air was a divine inspiration. A temple was built over the spot, priests and priestesses were installed, a city began to rise, and in process of time Delphi became the most celebrated oracle in the world; and as the vast treasures which had been accumulated there consisted mainly of gifts and offerings consecrated to a divine and sacred service, they were all understood to be under divine protection. They were defended, it is true, in part by the inaccessibleness of the position of Delphi, and by the artificial fortifications which had been added from time to time to increase the security, but still more by the feeling which every where prevailed, that any violence offered to such a shrine would be punished by the gods as sacrilege. The account of the manner in which Xerxes was repulsed, as related by the ancient historians, is somewhat marvelous. We, however, in this case, as in all others, transmit the story to our readers as the ancient historians give it to us.

The main body of the army pursued its way directly southward toward the city of Athens, which was now the great object at which Xerxes aimed. A large detachment, however, separating from the main body, moved more to the westward, toward Delphi. Their plan was to plunder the temples and the city, and send the treasures to the king. The Delphians, on hearing this, were seized with consternation. They made application themselves to the oracle, to know what they were to do in respect to the sacred treasures. They could not defend them, they said, against such a host, and they inquired whether they should bury them in the earth, or attempt to remove them to some distant place of safety.

The oracle replied that they were to do nothing at all in respect to the sacred treasures. The divinity, it said, was able to protect what was its own. They, on their part, had only to provide for themselves, their wives, and their children.

On hearing this response, the people dismissed all care in respect to the treasures of the temple and of the shrine, and made arrangements for removing their families and their own effects to some place of safety toward the southward. The military force of the city and a small number of the inhabitants alone remained.

When the Persians began to draw near, a prodigy occurred in the temple, which seemed intended to warn the profane invaders away. It seems that there was a suit of arms, of a costly character doubtless, and highly decorated with gold and gems--the present, probably, of some Grecian state or king--which were hung in an inner and sacred apartment of the temple, and which it was sacrilegious for any human hand to touch. These arms were found, on the day when the Persians were approaching, removed to the outward front of the temple. The priest who first observed them was struck with amazement and awe. He spread the intelligence among the soldiers and the people that remained, and the circumstance awakened in them great animation and

courage.

Nor were the hopes of divine interposition which this wonder awakened disappointed in the end; for, as soon as the detachment of Persians came near the hill on which Delphi was situated, loud thunder burst from the sky, and a bolt, descending upon the precipices near the town, detached two enormous masses of rock, which rolled down upon the ranks of the invaders. The Delphian soldiers, taking advantage of the scene of panic and confusion which this awful visitation produced, rushed down upon their enemies and completed their discomfiture. They were led on and assisted in this attack by the spirits of two ancient heroes, who had been natives of the country, and to whom two of the temples of Delphi had been consecrated. These spirits appeared in the form of tall and full-armed warriors, who led the attack, and performed prodigies of strength and valor in the onset upon the Persians; and then, when the battle was over, disappeared as mysteriously as they came.

In the mean time the great body of the army of Xerxes, with the monarch at their head, was advancing on Athens. During his advance the city had been in a continual state of panic and confusion. In the first place, when the Greek fleet had concluded to give up the contest in the Artemisian Channel, before the battle of Thermopylae, and had passed around to Salamis, the commanders in the city of Athens had given up the hope of making any effectual defense, and had given orders that the inhabitants should save themselves by seeking a refuge wherever they could find it. This annunciation, of course, filled the city with dismay, and the preparations for a general flight opened every where scenes of terror and distress, of which those who have never witnessed the evacuation of a city by its inhabitants can scarcely conceive.

The immediate object of the general terror was, at this time, the Persian fleet; for the Greek fleet, having determined to abandon the waters on that side of Attica, left the whole coast exposed, and the Persians might be expected at any hour to make a landing within a few miles of the city. Scarcely, however, had the impending of this danger been made known to the city, before the tidings of one still more imminent reached it, in the news that the Pass of Thermopylae had been carried, and that, in addition to the peril with which the Athenians were threatened by the fleet on the side of the sea, the whole Persian army was coming down upon them by land. This fresh alarm greatly increased, of course, the general consternation. All the roads leading from the city toward the south and west were soon covered with parties of wretched fugitives, exhibiting as they pressed forward, weary and wayworn, on their toilsome and almost hopeless flight, every possible phase of misery, destitution, and despair. The army fell back to the isthmus, intending to make a stand, if possible, there, to defend the Peloponnesus. The fugitives made the best of their way to the sea-coast, where they were received on board transport ships sent thither from the fleet, and conveyed, some to AEgina, some to Salamis, and others to other points on the coasts and islands to the south, wherever the terrified exiles thought there was the best prospect of safety.

Some, however, remained at Athens. There was a part of the population who believed that the phrase "wooden walls," used by the oracle, referred, not to the ships of the fleet, but to the wooden palisade around the citadel. They accordingly repaired and strengthened the palisade, and established themselves in the fortress with a small garrison which undertook to defend it.

The citadel of Athens, or the Acropolis, as it was called, was the richest, and most splendid, and magnificent fortress in the world. It was built upon an oblong rocky hill, the sides of which were perpendicular cliffs, except at one end, where alone the summit was accessible. This summit presented an area of an oval form, about a thousand feet in length and five hundred broad, thus containing a space of about ten acres. This area upon the summit, and also the approaches at the western end, were covered with the most grand, imposing, and costly architectural structures that then existed in the whole European world. There were temples, colonnades, gateways, stairways, porticoes, towers, and walls, which, viewed as a whole, presented a most magnificent spectacle, that excited universal admiration, and which, when examined in detail, awakened a greater degree of wonder still by the costliness of the materials, the beauty and perfection of the workmanship, and the richness and profusion of the decorations, which were seen on every hand. The number and variety of statues of bronze and of marble which had been erected in the various temples and upon the different platforms were very great. There was one, a statue of Minerva, which was executed by Phidias, the great Athenian sculptor, after the celebrated battle of Marathon, in the days of Darius, which, with its pedestal, was sixty feet high. It stood on the left of the grand entrance, towering above the buildings in full view from the country below, and leaning upon its long spear like a colossal sentinel on guard. In the distance, on the right, from the same point of view, the great temple called the Parthenon was to be seen, a temple which was, in some respects, the most celebrated in the world. The ruins of these edifices remain to the present day, standing in desolate and solitary grandeur on the rocky hill which they once so richly adorned.

When Xerxes arrived at Athens, he found, of course, no difficulty in obtaining possession of the city itself, since it had been deserted by its inhabitants, and left defenseless. The people that remained had all crowded into the citadel. They had built the

wooden palisade across the only approach by which it was possible to get near the gates, and they had collected large stones on the tops of the rocks, to roll down upon their assailants if they should attempt to ascend.

[Illustration: THE CITADEL AT ATHENS.]

Xerxes, after ravaging and burning the town, took up a position upon a hill opposite to the citadel, and there he had engines constructed to throw enormous arrows, on which tow that had been dipped in pitch was wound. This combustible envelopment of the arrows was set on fire before the weapon was discharged, and a shower of the burning missiles thus formed was directed toward the palisade. The wooden walls were soon set on fire by them, and totally consumed. The access to the Acropolis was, however, still difficult, being by a steep acclivity, up which it was very dangerous to ascend so long as the besiegers were ready to roll down rocks upon their assailants from above.

At last, however, after a long conflict and much slaughter, Xerxes succeeded in forcing his way into the citadel. Some of his troops contrived to find a path by which they could climb up to the walls. Here, after a desperate combat with those who were stationed to guard the place, they succeeded in gaining admission, and then opened the gates to their comrades below. The Persian soldiers, exasperated with the resistance which they had encountered, slew the soldiers of the garrison, perpetrated every imaginable violence on the wretched inhabitants who had fled there for shelter, and then plundered the citadel and set it on fire.

The heart of Xerxes was filled with exultation and joy as he thus arrived at the attainment of what had been the chief and prominent object of his campaign. To plunder and destroy the city of Athens had been the great pleasure that he had promised himself in all the mighty preparations that he had made. This result was now realized, and he dispatched a special messenger immediately to Susa with the triumphant tidings.

CHAPTER XI.

THE BATTLE OF SALAMIS.

B.C. 480

Situation of Salamis.--Movements of the fleet and the army.--Policy of the Greeks.--Reasons for retreating to Salamis.--A council of war.--Consultations and debates.--Conflicting views.--The council breaks up in confusion.--Themistocles.--Interview with Mnesiphilus.--Themistocles seeks Eurybiades.--Urges a new council.--The council convened again.--Themistocles rebuked.--Themistocles's arguments for remaining at Salamis.--Fugitives at Salamis.--Views of the Corinthians.--Excitement in the council.--Indignation of Themistocles.--Eurybiades decides to remain at Salamis.--An earthquake.--Advance of the Persians.--Perilous situation of the Greeks.--Xerxes summons a council of war.--Pompous preparations.--Views of the Persian officers.--Views of Queen Artemisia.--Artemisa's arguments against attacking the Greek fleet.--Effect of Artemisia's speech.--Feelings of the council.--Discontent among the Greeks.--Sicinnus.--Bold stratagem of Themistocles.--He sends Sicinnus to the Persians.--Message of Themistocles.--Measures of the Persians.--The Persians take possession of the Psyttalia.--The Greeks hemmed in.--Aristides.--He makes his way through the Persian fleet.--Interview between Aristides and Themistocles.--Their conversation.--Aristides communicates his intelligence to the assembly.--Effect of Aristides intelligence.--Further news.--Adventurous courage of Paraetius.--Gratitude of the Greeks.--Final preparations for battle.--Friendly offices.--Xerxes's throne.--His scribes.--Summary punishment.--Speech of Themistocles.--He embarks his men.--Excitement and confusion.--Commencement of the battle.--Fury of the conflict.--Modern naval battles.--Observations of Xerxes.--Artemisia.--Enemies of Artemisia.--Her quarrel with Damasithymus.--Stratagem of Artemisia.--She attacks Damasithymus.--Artemisia kills Damasithymus.--Xerxes's opinion of her valor.--Progress of the battle.--The Persians give way.--Heroism of Aristides.--He captures Psyttalia.--The Greeks victorious.--Repairing damages.--Xerxes resolves on flight.--The sea after the battle.--Fulfillment of an ancient prophecy.

Salamis is an island of a very irregular form, lying in the Saronian Gulf, north of AEgina, and to the westward of Athens. What was called the Port of Athens was on the shore opposite to Salamis, the city itself being situated on elevated land four or five miles back from the sea. From this port to the bay on the southern side of Salamis, where the Greek fleet was lying, it was only four or five miles more, so that, when Xerxes burned the city, the people on board the galleys in the fleet might easily see the smoke of the conflagration.

The Isthmus of Corinth was west of Salamis, some fifteen miles, across the bay. The army, in retreating from Athens toward the isthmus, would have necessarily to pass round the bay in a course somewhat circuitous, while the fleet, in following them, would pass in a direct line across it. The geographical relations of these places, a knowledge of which is necessary to a full understanding of the operations of the Greek and Persian forces, will be distinctly seen by comparing the above description with the map placed at the commencement of the fifth chapter.

It had been the policy of the Greeks to keep the fleet and army as much as possible together, and thus, during the time in which the troops were attempting a concentration at Thermopylae, the ships made their rendezvous in the Artemisian Strait or Channel, directly opposite to that point of the coast. There they fought, maintaining their position desperately, day after day, as long as Leonidas and his Spartans held their ground on the shore. Their sudden disappearance from those waters, by which the Persians had been so much surprised, was caused by their having received intelligence that the pass had been carried and Leonidas destroyed. They knew then that Athens would be the next point of resistance by the land forces. They therefore fell back to Salamis, or, rather, to the bay lying between Salamis and the Athenian shore, that being the nearest position that they could take to support the operations of the army in their attempts to defend the capital. When, however, the tidings came to them that Athens had fallen, and that what remained of the army had retreated to the isthmus, the question at once arose whether the fleet should retreat too, across the bay, to the isthmus shore, with a view to co-operate more fully with the army in the new position which the latter had taken, or whether it should remain where it was, and defend itself as it best could against the Persian squadrons which would soon be drawing near. The commanders of the fleet held a consultation to consider this question.

In this consultation the Athenian and the Corinthian leaders took different views. In fact, they were very near coming into open collision. Such a difference of opinion, considering the circumstances of the case, was not at all surprising. It might, indeed, have naturally been expected to arise, from the relative situation of the two cities, in respect to the danger which threatened them. If the Greek fleet were to withdraw from Salamis to the isthmus, it might be in a better position to defend Corinth, but it would, by such a movement, be withdrawing from the Athenian territories, and abandoning what remained in Attica wholly to the conqueror. The Athenians were, therefore, in favor of maintaining the position at Salamis, while the Corinthians were disposed to retire to the shores of the isthmus, and co-operate with the army there.

The council was convened to deliberate on this subject before the news arrived of the actual fall of Athens, although, inasmuch as the Persians were advancing into Attica in immense numbers, and there was no Greek force left to defend the city, they considered its fall as all but inevitable. The tidings of the capture and destruction of Athens came while the council was in session. This seemed to determine the question. The Corinthian commanders, and those from the other Peloponnesian cities, declared that it was perfectly absurd to remain any longer at Salamis, in a vain attempt to defend a country already conquered. The council was broken up in confusion, each commander retiring to his own ship, and the Peloponnesians resolving to withdraw on the following morning. Eurybiades, who, it will be recollected, was the commander-in-chief of all the Greek fleet, finding thus that it was impossible any longer to keep the ships together at Salamis, since a part of them would, at all events, withdraw, concluded to yield to the necessity of the case and to conduct the whole fleet to the isthmus. He issued his orders accordingly, and the several commanders repaired to their respective ships to make the preparations. It was night when the council was dismissed, and the fleet was to move in the morning.

One of the most influential and distinguished of the Athenian officers was a general named Themistocles. Very soon after he had returned to his ship from this council, he was visited by another Athenian named Mnesiphilus, who, uneasy and anxious in the momentous crisis, had come in his boat, in the darkness of the night, to Themistocles's ship, to converse with him on the plans of the morrow. Mnesiphilus asked Themistocles what was the decision of the council.

"To abandon Salamis," said Themistocles, "and retire to the isthmus."

"Then," said Mnesiphilus, "we shall never have an opportunity to meet the enemy. I am sure that if we leave this position the fleet will be wholly broken up, and that each portion will go, under its own commander, to defend its own state or seek its own safety, independently of the rest. We shall never be able to concentrate our forces again. The result will be the inevitable dissolution of the fleet as a combined and allied force, in spite of all that Eurybiades or any one else can do to prevent it."

Mnesiphilus urged this danger with so much earnestness and eloquence as to make a very considerable impression on the mind of Themistocles. Themistocles said nothing, but his countenance indicated that he was very strongly inclined to adopt Mnesiphilus's views. Mnesiphilus urged him to go immediately to Eurybiades, and endeavor to induce him to obtain a reversal of the decision of

the council. Themistocles, without expressing either assent or dissent, took his boat, and ordered the oarsmen to row him to the galley of Eurybiades. Mnesiphilus, having so far accomplished his object, went away.

Themistocles came in his boat to the side of Eurybiades's galley. He said that he wished to speak with the general on a subject of great importance. Eurybiades, when this was reported to him, sent to invite Themistocles to come on board. Themistocles did so, and he urged upon the general the same arguments that Mnesiphilus had pressed upon him, namely, that if the fleet were once to move from their actual position, the different squadrons would inevitably separate, and could never be assembled again. He urged Eurybiades, therefore, very strenuously to call a new council, with a view of reversing the decision that had been made to retire, and of resolving instead to give battle to the Persians at Salamis.

Eurybiades was persuaded, and immediately took measures for convening the council again. The summons, sent around thus at midnight, calling upon the principal officers of the fleet to repair again in haste to the commander's galley, when they had only a short time before been dismissed from it, produced great excitement. The Corinthians, who had been in favor of the plan of abandoning Salamis, conjectured that the design might be to endeavor to reverse that decision, and they came to the council determined to resist any such attempt, if one should be made.

When the officers had arrived, Themistocles began immediately to open the discussion, before, in fact, Eurybiades had stated why he had called them together. A Corinthian officer interrupted and rebuked him for presuming to speak before his time. Themistocles retorted upon the Corinthian, and continued his harangue. He urged the council to review their former decision, and to determine, after all, to remain at Salamis. He, however, now used different arguments from those which he had employed when speaking to Eurybiades alone; for to have directly charged the officers themselves with the design of which he had accused them to Eurybiades, namely, that of abandoning their allies, and retiring with their respective ships, each to his own coast, in case the position at Salamis were to be given up, would only incense them, and arouse a hostility which would determine them against any thing that he might propose.

He therefore urged the expediency of remaining at Salamis on other grounds. Salamis was a much more advantageous position, he said, than the coast of the isthmus, for a small fleet to occupy in awaiting an attack from a large one. At Salamis they were defended in part by the projections of the land, which protected their flanks, and prevented their being assailed, except in front, and their front they might make a very narrow one. At the isthmus, on the contrary, there was a long, unvaried, and unsheltered coast, with no salient points to give strength or protection to their position there. They could not expect to derive serious advantage from any degree of co-operation with the army on the land which would be practicable at the isthmus, while their situation at sea there would be far more exposed and dangerous than where they then were. Besides, many thousands of the people had fled to Salamis for refuge and protection, and the fleet, by leaving its present position, would be guilty of basely abandoning them all to hopeless destruction, without even making an effort to save them.

This last was, in fact, the great reason why the Athenians were so unwilling to abandon Salamis. The unhappy fugitives with which the island was thronged were their wives and children, and they were extremely unwilling to go away and leave them to so cruel a fate as they knew would await them if the fleet were to be withdrawn. The Corinthians, on the other hand, considered Athens as already lost, and it seemed madness to them to linger uselessly in the vicinity of the ruin which had been made, while there were other states and cities in other quarters of Greece yet to be saved. The Corinthian speaker who had rebuked Themistocles at first, interrupted him again, angrily, before he finished his appeal.

"You have no right to speak," said he. "You have no longer a country. When you cease to represent a power, you have no right to take a part in our councils."

This cruel retort aroused in the mind of Themistocles a strong feeling of indignation and anger against the Corinthian. He loaded his opponent, in return, with bitter reproaches, and said, in conclusion, that as long as the Athenians had two hundred ships in the fleet, they had still a country--one, too, of sufficient importance to the general defense to give them a much better title to be heard in the common consultations than any Corinthian could presume to claim.

Then turning to Eurybiades again, Themistocles implored him to remain at Salamis, and give battle to the Persians there, as that was, he said, the only course by which any hope remained to them of the salvation of Greece. He declared that the Athenian part of the fleet would never go to the isthmus. If the others decided on going there, they, the Athenians, would gather all the fugitives they could from the island of Salamis and from the coasts of Attica, and make the best of their way to Italy, where there was a territory to which they had some claim, and, abandoning Greece forever, they would found a new kingdom there.

Eurybiades, the commander-in-chief, if he was not convinced by the arguments that Themistocles had offered, was alarmed at his declaration that the Athenian ships would abandon the cause of the Greeks if the fleet abandoned Salamis; he accordingly gave his voice very decidedly for remaining where they were. The rest of the officers finally acquiesced in this decision, and the council broke up, the various members of it returning each to his own command. It was now nearly morning. The whole fleet had been, necessarily, during the night in a state of great excitement and suspense, all anxious to learn the result of these deliberations. The awe and solemnity which would, of course, pervade the minds of men at midnight, while such momentous questions were pending, were changed to an appalling sense of terror, toward the dawn, by an earthquake which then took place, and which, as is usually the case with such convulsions, not only shook the land, but was felt by vessels on the sea. The men considered this phenomenon as a solemn warning from heaven, and measures were immediately adopted for appeasing, by certain special sacrifices and ceremonies, the divine displeasure which the shock seemed to portend.

In the mean time, the Persian fleet, which we left, it will be recollected, in the channels between Euboea and the main land, near to Thermopylae, had advanced when they found that the Greeks had left those waters, and, following their enemies to the southward through the channel called the Euripus, had doubled the promontory called Sunium, which is the southern promontory of Attica, and then, moving northward again along the western coast of Attica, had approached Phalerum, which was not far from Salamis. Xerxes, having concluded his operations at Athens, advanced to the same point by land.

The final and complete success of the Persian expedition seemed now almost sure. All the country north of the peninsula had fallen. The Greek army had retreated to the isthmus, having been driven from every other post, and its last forlorn hope of being able to resist the advance of its victorious enemies was depending there. And the commanders of the Persian fleet, having driven the Greek squadrons in the same manner from strait to strait and from sea to sea, saw the discomfited galleys drawn up, in apparently their last place of refuge, in the Bay of Salamis, and only waiting to be captured and destroyed.

In a word, every thing seemed ready for the decisive and final blow, and Xerxes summoned a grand council of war on board one of the vessels of the fleet as soon as he arrived at Phalerum, to decide upon the time and manner of striking it.

The convening of this council was arranged, and the deliberations themselves conducted, with great parade and ceremony. The princes of the various nations represented in the army and in the fleet, and the leading Persian officers and nobles, were summoned to attend it. It was held on board one of the principal galleys, where great preparations had been made for receiving so august an assemblage. A throne was provided for the king, and seats for the various commanders according to their respective ranks, and a conspicuous place was assigned to Artemisia, the Carian queen, who, the reader will perhaps recollect, was described as one of the prominent naval commanders, in the account given of the great review at Doriscus. Mardonius appeared at the council as the king's representative and the conductor of the deliberations, there being required, according to the parliamentary etiquette of those days, in such royal councils as these, a sort of mediator, to stand between the king and his counselors, as if the monarch himself was on too sublime an elevation of dignity and grandeur to be directly addressed even by princes and nobles.

Accordingly, when the council was convened and the time arrived for opening the deliberations, the king directed Mardonius to call upon the commanders present, one by one, for their sentiments on the question whether it were advisable or not to attack the Greek fleet at Salamis. Mardonius did so. They all advised that the attack should be made, urging severally various considerations to enforce their opinions, and all evincing a great deal of zeal and ardor in the cause, and an impatient desire that the great final conflict should come on.

When, however, it came to Artemisia's turn to speak, it appeared that she was of a different sentiment from the rest. She commenced her speech with something like an apology for presuming to give the king her council. She said that, notwithstanding her sex, she had performed her part, with other commanders, in the battles which had already occurred, and that she was, perhaps, entitled accordingly, in the consultations which were held, to express her opinion. "Say, then, to the king," she continued, addressing Mardonius, as all the others had done, "that my judgment is, that we should not attack the Greek fleet at Salamis, but, on the contrary, that we should avoid a battle. It seems to me that we have nothing to gain, but should put a great deal at hazard by a general naval conflict at the present time. The truth is, that the Greeks, always terrible as combatants, are rendered desperate now by the straits to which they are reduced and the losses that they have sustained. The seamen of our fleet are as inferior to them in strength and courage as women are to men. I am sure that it will be a very dangerous thing to encounter them in their present chafed and irritated temper. Whatever others may think, I myself should not dare to answer for the result.

"Besides, situated as they are," continued Artemisia, "a battle is what _they_ must most desire, and, of course, it is adverse to our interest to accord it to them. I have ascertained that they have but a small supply of food, either in their fleet or upon the island of Salamis, while they have, besides their troops, a great multitude of destitute and helpless fugitives to be fed. If we simply leave them to themselves under the blockade in which our position here now places them, they will soon be reduced to great distress. Or, if we withdraw from them, and proceed at once to the Peloponnesus, to co-operate with the army there, we shall avoid all the risk of a battle, and I am sure that the Greek fleet will never dare to follow or to molest us."

The several members of the council listened to this unexpected address of Artemisia with great attention and interest, but with very different feelings. She had many friends among the counselors, and _they_ were anxious and uneasy at hearing her speak in this manner, for they knew very well that it was the king's decided intention that a battle should be fought, and they feared that, by this bold and strenuous opposition to it, Artemisia would incur the mighty monarch's displeasure. There were others who were jealous of the influence which Artemisia enjoyed, and envious of the favor with which they knew that Xerxes regarded her. These men were secretly pleased to hear her uttering sentiments by which they confidently believed that she would excite the anger of the king, and wholly lose her advantageous position. Both the hopes and the fears, however, entertained respectively by the queen's enemies and friends, proved altogether groundless. Xerxes was not displeased. On the contrary, he applauded Artemisia's ingenuity and eloquence in the highest terms, though he said, nevertheless, that he would follow the advice of the other counselors. He dismissed the assembly, and gave orders to prepare for battle.

In the mean time a day or two had passed away, and the Greeks, who had been originally very little inclined to acquiesce in the decision which Eurybiades had made, under the influence of Themistocles, to remain at Salamis and give the Persians battle, became more and more dissatisfied and uneasy as the great crisis drew nigh. In fact, the discontent and disaffection which appeared in certain portions of the fleet became so decided and so open, that Themistocles feared that some of the commanders would actually revolt, and go away with their squadrons in a body, in defiance of the general decision to remain. To prevent such a desertion as this, he contrived the following very desperate stratagem.

He had a slave in his family named Sicinnus, who was an intelligent and educated man, though a slave. In fact, he was the teacher of Themistocles's children. Instances of this kind, in which slaves were refined and cultivated men, were not uncommon in ancient times, as slaves were, in many instances, captives taken in war, who before their captivity had occupied as high social positions as their masters. Themistocles determined to send Sicinnus to the Persian fleet with a message from him, which should induce the Persians themselves to take measures to prevent the dispersion of the Greek fleet. Having given the slave, therefore, his secret instructions, he put him into a boat when night came on, with oarsmen who were directed to row him wherever he should require them to go. The boat pushed off stealthily from Themistocles's galley, and, taking care to keep clear of the Greek ships which lay at anchor near them, went southward toward the Persian fleet. When the boat reached the Persian galleys, Sicinnus asked to see the commander, and, on being admitted to an interview with him, he informed him that he came from Themistocles, who was the leader, he said, of the Athenian portion of the Greek fleet.

"I am charged," he added, "to say to you from Themistocles that he considers the cause of the Greeks as wholly lost, and he is now, accordingly, desirous himself of coming over to the Persian side. This, however, he can not actually and openly do, on account of the situation in which he is placed in respect to the rest of the fleet. He has, however, sent me to inform you that the Greek fleet is in a very disordered and helpless condition, being distracted by the dissensions of the commanders, and the general discouragement and despair of the men; that some divisions are secretly intending to make their escape; and that, if you can prevent this by surrounding them, or by taking such positions as to intercept any who may attempt to withdraw, the whole squadron will inevitably fall into your hands."

Having made this communication, Sicinnus went on board his boat again, and returned to the Greek fleet as secretly and stealthily as he came.

The Persians immediately determined to resort to the measures which Themistocles had recommended to prevent the escape of any part of the Greek fleet. There was a small island between Salamis and the coast of Attica, that is, on the eastern side of Salamis, called Psyttalia, which was in such a position as to command, in a great measure, the channel of water between Salamis and the main land on this side. The Persians sent forward a detachment of galleys to take possession of this island in the night. By this means they hoped to prevent the escape of any part of the Greek squadron in that direction. Besides, they foresaw that in the approaching battle the principal scene of the conflict must be in that vicinity, and that, consequently, the island would become the great resort of the disabled ships and the wounded men, since they would naturally seek refuge on the nearest land. To preoccupy

this ground, therefore, seemed an important step. It would enable them, when the terrible conflict should come on, to drive back any wretched refugees who might attempt to escape from destruction by seeking the shore.

By taking possession of this island, and stationing galleys in the vicinity of it, all which was done secretly in the night, the Persians cut off all possibility of escape for the Greeks in that direction. At the same time, they sent another considerable detachment of their fleet to the westward, which was the direction toward the isthmus, ordering the galleys thus sent to station themselves in such a manner as to prevent any portion of the Greek fleet from going round the island of Salamis, and making their escape through the northwestern channel. By this means the Greek fleet was environed on every side--hemmed in, though they were not aware of it, in such a way as to defeat any attempt which any division might make to retire from the scene.

The first intelligence which the Greeks received of their being thus surrounded was from an Athenian general named Aristides, who came one night from the island of AEgina to the Greek fleet, making his way with great difficulty through the lines of Persian galleys. Aristides had been, in the political conflicts which had taken place in former years at Athens, Themistocles's great rival and enemy. He had been defeated in the contests which had taken place, and had been banished from Athens. He now, however, made his way through the enemy's lines, incurring, in doing it, extreme difficulty and danger, in order to inform his countrymen of their peril, and to assist, if possible, in saving them.

When he reached the Greek fleet, the commanders were in council, agitating, in angry and incriminating debates, the perpetually recurring question whether they should retire to the isthmus, or remain where they were. Aristides called Themistocles out of the council. Themistocles was very much surprised at seeing his ancient enemy thus unexpectedly appear. Aristides introduced the conversation by saying that he thought that at such a crisis they ought to lay aside every private animosity, and only emulate each other in the efforts and sacrifices which they could respectively make to defend their country; that he had, accordingly, come from AEgina to join the fleet, with a view of rendering any aid that it might be in his power to afford; that it was now wholly useless to debate the question of retiring to the isthmus, for such a movement was no longer possible. "The fleet is surrounded," said he. "The Persian galleys are stationed on every side. It was with the utmost difficulty that I could make my way through the lines. Even if the whole assembly, and Eurybiades himself, were resolved on withdrawing to the isthmus, the thing could not now be done. Return, therefore, and tell them this, and say that to defend themselves where they are is the only alternative that now remains."

In reply to this communication, Themistocles said that nothing could give him greater pleasure than to learn what Aristides had stated. "The movement which the Persians have made," he said, "was in consequence of a communication which I myself sent to them. I sent it, in order that some of our Greeks, who seem so very reluctant to fight, might be compelled to do so. But you must come yourself into the assembly," he added, "and make your statement directly to the commanders. They will not believe it if they hear it from me. Come in, and state what you have seen."

Aristides accordingly entered the assembly, and informed the officers who were convened that to retire from their present position was no longer possible, since the sea to the west was fully guarded by lines of Persian ships, which had been stationed there to intercept them. He had just come in himself, he said, from AEgina, and had found great difficulty in passing through the lines, though he had only a single small boat, and was favored by the darkness of the night. He was convinced that the Greek fleet was entirely surrounded.

Having said this, Aristides withdrew. Although he could come, as a witness, to give his testimony in respect to facts, he was not entitled to take any part in the deliberations.

The assembly was thrown into a state of the greatest possible excitement by the intelligence which Aristides had communicated. Instead of producing harmony among them, it made the discord more violent and uncontrollable. Of those who had before wished to retire, some were now enraged that they had not been allowed to do so while the opportunity remained; others disbelieved Aristides's statements, and were still eager to go; while the rest, confirmed in their previous determination to remain where they were, rejoiced to find that retreat was no longer possible. The debate was confused and violent. It turned, in a great measure, on the degree of credibility to be attached to the account which Aristides had given them. Many of the assembly wholly disbelieved it. It was a stratagem, they maintained, contrived by the Athenian party, and those who wished to remain, in order to accomplish their end of keeping the fleet from changing its position.

The doubts, however, which the assembly felt in respect to the truth of Aristides's tidings were soon dispelled by new and incontestable evidence; for, while the debate was going on, it was announced that a large galley--a trireme, as it was called--had come in from the Persian fleet. This galley proved to be a Greek ship from the island of Tenos, one which Xerxes, in prosecution of

his plan of compelling those portions of the Grecian territories that he had conquered, or that had surrendered to him, to furnish forces to aid him in subduing the rest, had pressed into his service. The commander of this galley, unwilling to take part against his countrymen in the conflict, had decided to desert the Persian fleet by taking advantage of the night, and to come over to the Greeks. The name of the commander of this trireme was Paraetius. He confirmed fully all that Aristides had said. He assured the Greeks that they were completely surrounded, and that nothing remained for them but to prepare, where they were, to meet the attack which would certainly be made upon them in the morning. The arrival of this trireme was thus of very essential service to the Greeks. It put an end to their discordant debates, and united them, one and all, in the work of making resolute preparations for action. This vessel was also of very essential service in the conflict itself which ensued; and the Greeks were so grateful to Paraetius and to his comrades for the adventurous courage which they displayed in coming over under such circumstances, in such a night, to espouse the cause and to share the dangers of their countrymen, that after the battle they caused all their names to be engraved upon a sacred tripod, made in the most costly manner for the purpose, and then sent the tripod to be deposited at the oracle of Delphi, where it long remained a monument of this example of Delian patriotism and fidelity.

As the morning approached, the preparations were carried forward with ardor and energy, on board both fleets, for the great struggle which was to ensue. Plans were formed; orders were given; arms were examined and placed on the decks of the galleys, where they would be most ready at hand. The officers and soldiers gave mutual charges and instructions to each other in respect to the care of their friends and the disposal of their effects--charges and instructions which each one undertook to execute for his friend in case he should survive him. The commanders endeavored to animate and encourage their men by cheerful looks, and by words of confidence and encouragement. They who felt resolute and strong endeavored to inspirit the weak and irresolute, while those who shrank from the approaching contest, and dreaded the result of it, concealed their fears, and endeavored to appear impatient for the battle.

Xerxes caused an elevated seat or throne to be prepared for himself on an eminence near the shore, upon the main land, in order that he might be a personal witness of the battle. He had a guard and other attendants around him. Among these were a number of scribes or secretaries, who were prepared with writing materials to record the events which might take place, as they occurred, and especially to register the names of those whom Xerxes should see distinguishing themselves by their courage or by their achievements. He justly supposed that these arrangements, the whole fleet being fully informed in regard to them, would animate the several commanders with strong emulation, and excite them to make redoubled exertions to perform their part well. The record which was thus to be kept, under the personal supervision of the sovereign, was with a view to punishments too, as well as to honors and rewards; and it happened in many instances during the battle that ensued, that commanders, who, after losing their ships, escaped to the shore, were brought up before Xerxes's throne, and there expiated their fault or their misfortune, whichever it might have been, by being beheaded on the spot, without mercy. Some of the officers thus executed were Greeks, brutally slaughtered for not being successful in fighting, by compulsion, against their own countrymen.

As the dawn approached, Themistocles called together as many of the Athenian forces as it was possible to convene, assembling them at a place upon the shore of Salamis where he could conveniently address them, and there made a speech to them, as was customary with the Greek commanders before going into battle. He told them that, in such contests as that in which they were about to engage, the result depended, not on the relative numbers of the combatants, but on the resolution and activity which they displayed. He reminded them of the instances in which small bodies of men, firmly banded together by a strict discipline, and animated by courage and energy, had overthrown enemies whose numbers far exceeded their own. The Persians were more numerous, he admitted, than they, but still the Greeks would conquer them. If they faithfully obeyed their orders, and acted strictly and perseveringly in concert, according to the plans formed by the commanders, and displayed the usual courage and resolution of Greeks, he was sure of victory.

As soon as Themistocles had finished his speech, he ordered his men to embark, and the fleet immediately afterward formed itself in battle array.

Notwithstanding the strictness of the order and discipline which generally prevailed in Greek armaments of every kind, there was great excitement and much confusion in the fleet while making all these preparations, and this excitement and confusion increased continually as the morning advanced and the hour for the conflict drew nigh. The passing of boats to and fro, the dashing of the oars, the clangor of the weapons, the vociferations of orders by the officers and of responses by the men, mingled with each other in dreadful turmoil, while all the time the vast squadrons were advancing toward each other, each party of combatants eager to begin the contest. In fact, so full of wild excitement was the scene, that at length the battle was found to be raging on every side, while no one knew or could remember how it began. Some said that a ship, which had been sent away a short time before to

AEgina to obtain succors, was returning that morning, and that she commenced the action as she came through the Persian lines. Others said the Greek squadron advanced as soon as they could see, and attacked the Persians; and there were some whose imaginations were so much excited by the scene that they saw a female form portrayed among the dim mists of the morning, that urged the Greeks onward by beckonings and calls. They heard her voice, they said, crying to them, "Come on! come on! this is no time to linger on your oars."

However this may be, the battle was soon furiously raging on every part of the Bay of Salamis, exhibiting a wide-spread scene of conflict, fury, rage, despair, and death, such as had then been seldom witnessed in any naval conflict, and such as human eyes can now never look upon again. In modern warfare the smoke of the guns soon draws an impenetrable veil over the scene of horror, and the perpetual thunder of the artillery overpowers the general din. In a modern battle, therefore, none of the real horrors of the conflict can either be heard or seen by any spectator placed beyond the immediate scene of it. The sights and the sounds are alike buried and concealed beneath the smoke and the noise of the cannonading. There were, however, no such causes in this case to obstruct the observations which Xerxes was making from his throne on the shore. The air was calm, the sky serene, the water was smooth, and the atmosphere was as transparent and clear at the end of the battle as at the beginning. Xerxes could discern every ship, and follow it with his eye in all its motions. He could see who advanced and who retreated. Out of the hundreds of separate conflicts he could choose any one, and watch the progress of it from the commencement to the termination. He could see the combats on the decks, the falling of repulsed assailants into the water, the weapons broken, the wounded carried away, and swimmers struggling like insects on the smooth surface of the sea. He could see the wrecks, too, which were drifted upon the shores, and the captured galleys, which, after those who defended them had been vanquished--some killed, others thrown overboard, and others made prisoners--were slowly towed away by the victors to a place of safety.

There was one incident which occurred in this scene, as Xerxes looked down upon it from the eminence where he sat, which greatly interested and excited him, though he was deceived in respect to the true nature of it. The incident was one of Artemisia's stratagems. It must be premised, in relating the story, that Artemisia was not without enemies among the officers of the Persian fleet. Many of them were envious of the high distinction which she enjoyed, and jealous of the attention which she received from the king, and of the influence which she possessed over him. This feeling showed itself very distinctly at the grand council, when she gave her advice, in connection with that of the other commanders, to the king. Among the most decided of her enemies was a certain captain named Damasithymus. Artemisia had had a special quarrel with him while the fleet was coming through the Hellespont, which, though settled for the time, left the minds of both parties in a state of great hostility toward each other.

It happened, in the course of the battle, that the ship which Artemisia personally commanded and that of Damasithymus were engaged, together with other Persian vessels, in the same part of the bay; and at a time when the ardor and confusion of the conflict was at its height, the galley of Artemisia, and some others that were in company with hers, became separated from the rest, perhaps by the too eager pursuit of an enemy, and as other Greek ships came up suddenly to the assistance of their comrades, the Persian vessels found themselves in great danger, and began to retreat, followed by their enemies. We speak of the retreating galleys as Persian, because they were on the Persian side in the contest, though it happened that they were really ships from Greek nations, which Xerxes had bribed or forced into his service. The Greeks knew them to be enemies, by the Persian flag which they bore.

In the retreat, and while the ships were more or less mingled together in the confusion, Artemisia perceived that the Persian galley nearest her was that of Damasithymus. She immediately caused her own Persian flag to be pulled down, and, resorting to such other artifices as might tend to make her vessel appear to be a Greek galley, she began to act as if she were one of the pursuers instead of one of the pursued. She bore down upon the ship of Damasithymus, saying to her crew that to attack and sink that ship was the only way to save their own lives. They accordingly attacked it with the utmost fury. The Athenian ships which were near, seeing Artemisia's galley thus engaged, supposed that it was one of their own, and pressed on, leaving the vessel of Damasithymus at Artemisia's mercy. It was such mercy as would be expected of a woman who would volunteer to take command of a squadron of ships of war, and go forth on an active campaign to fight for her life among such ferocious tigers as Greek soldiers always were, considering it all an excursion of pleasure. Artemisia killed Damasithymus and all of his crew, and sunk his ship, and then, the crisis of danger being past, she made good her retreat back to the Persian lines. She probably felt no special animosity against the crew of this ill-fated vessel, but she thought it most prudent to leave no man alive to tell the story.

Xerxes watched this transaction from his place on the hill with extreme interest and pleasure. He saw the vessel of Artemisia bearing down upon the other, which last he supposed, of course, from Artemisia's attacking it, was a vessel of the enemy. The only subject of doubt was whether the attacking ship was really that of Artemisia. The officers who stood about Xerxes at the time that

the transaction occurred assured him that it was. They knew it well by certain peculiarities in its construction. Xerxes then watched the progress of the contest with the most eager interest, and, when he saw the result of it, he praised Artemisia in the highest terms, saying that the men in his fleet behaved like women, while the only woman in it behaved like a man.

Thus Artemisia's exploit operated like a double stratagem. Both the Greeks and the Persians were deceived, and she gained an advantage by both the deceptions. She saved her life by leading the Greeks to believe that her galley was their friend, and she gained great glory and renown among the Persians by making them believe that the vessel which she sunk was that of an enemy.

Though these and some of the other scenes and incidents which Xerxes witnessed as he looked down upon the battle gave him pleasure, yet the curiosity and interest with which he surveyed the opening of the contest were gradually changed to impatience, vexation, and rage as he saw in its progress that the Greeks were every where gaining the victory. Notwithstanding the discord and animosity which had reigned among the commanders in their councils and debates, the men were united, resolute, and firm when the time arrived for action; and they fought with such desperate courage and activity, and, at the same time, with so much coolness, circumspection, and discipline, that the Persian lines were, before many hours, every where compelled to give way. A striking example of the indomitable and efficient resolution which, on such occasions, always characterized the Greeks, was shown in the conduct of Aristides. The reader will recollect that the Persians, on the night before the battle, had taken possession of the island of Psyttalia--which was near the center of the scene of contest--for the double purpose of enabling themselves to use it as a place of refuge and retreat during the battle, and of preventing their enemies from doing so. Now Aristides had no command. He had been expelled from Athens by the influence of Themistocles and his other enemies. He had come across from AEgina to the fleet at Salamis, alone, to give his countrymen information of the dispositions which the Persians had made for surrounding them. When the battle began, he had been left, it seems, on the shore of Salamis a spectator. There was a small body of troops left there also, as a guard to the shore. In the course of the combat, when Aristides found that the services of this guard were no longer likely to be required where they were, he placed himself at the head of them, obtained possession of boats or a galley, transported the men across the channel, landed them on the island of Psyttalia, conquered the post, and killed every man that the Persians had stationed there.

When the day was spent, and the evening came on, it was found that the result of the battle was a Greek victory, and yet it was not a victory so decisive as to compel the Persians wholly to retire. Vast numbers of the Persian ships were destroyed, but still so many remained, that when at night they drew back from the scene of the conflict, toward their anchorage ground at Phalerum, the Greeks were very willing to leave them unmolested there. The Greeks, in fact, had full employment on the following day in reassembling the scattered remnants of their own fleet, repairing the damages that they had sustained, taking care of their wounded men, and, in a word, attending to the thousand urgent and pressing exigencies always arising in the service of a fleet after a battle, even when it has been victorious in the contest. They did not know in exactly what condition the Persian fleet had been left, nor how far there might be danger of a renewal of the conflict on the following day. They devoted all their time and attention, therefore, to strengthening their defenses and reorganizing the fleet, so as to be ready in case a new assault should be made upon them.

But Xerxes had no intention of any new attack. The loss of this battle gave a final blow to his expectations of being able to carry his conquests in Greece any further. He too, like the Greeks, employed his men in industrious and vigorous efforts to repair the damages which had been done, and to reassemble and reorganize that portion of the fleet which had not been destroyed. While, however, his men were doing this, he was himself revolving in his mind, moodily and despairingly, plans, not for new conflicts, but for the safest and speediest way of making his own personal escape from the dangers around him, back to his home in Susa.

In the mean time, the surface of the sea, far and wide in every direction, was covered with the wrecks, and remnants, and fragments strewed over it by the battle. Dismantled hulks, masses of entangled spars and rigging, broken oars, weapons of every description, and the swollen and ghastly bodies of the dead, floated on the rolling swell of the sea wherever the winds or the currents carried them. At length many of these mournful memorials of the strife found their way across the whole breadth of the Mediterranean, and were driven up upon the beach on the coast of Africa, at a barbarous country called Colias. The savages dragged the fragments up out of the sand to use as fuel for their fires, pleased with their unexpected acquisitions, but wholly ignorant, of course, of the nature of the dreadful tragedy to which their coming was due. The circumstance, however, explained to the Greeks an ancient prophecy which had been uttered long before in Athens, and which the interpreters of such mysteries had never been able to understand. The prophecy was this:

The Colian dames on Afric's shores Shall roast their food with Persian oars.

CHAPTER XII.

THE RETURN OF XERXES TO PERSIA.

B.C. 480

Mardonius.--His apprehensions after the battle.--Depression of Xerxes.--Mardonius's address to him.--Mardonius offers to complete the conquest of Greece.--Effect of Mardonius's address.--Xerxes consults Artemisia.--Artemisia hesitates.--Her advice to Xerxes.--Xerxes adopts Artemesia's advice.--His anxiety increases.--Xerxes commences his retreat.--He sends his family to Ephesus.--Excitement in the Greek fleet.--The Persians pursued.--Debate among the generals.--Themistocles outvoted.--Another stratagem of Themistocles.--His message to Xerxes.--Duplicity of Themistocles.--Retreat of Xerxes.--Horrors of the retreat.--Sufferings from hunger.--Famine and disease.--Xerxes crosses the Hellespont.--Fate of Mardonius.--Xerxes arrives at Susa.--Xerxes's dissolute life.--His three sons.--Artabanus, captain of the guard.--He assassinates Xerxes.--Artaxerxes kills his brother.--He succeeds to the throne.

Mardonius, it will be recollected, was the commander-in-chief of the forces of Xerxes, and thus, next to Xerxes himself, he was the officer highest in rank of all those who attended the expedition. He was, in fact, a sort of prime minister, on whom the responsibility for almost all the measures for the government and conduct of the expedition had been thrown. Men in such positions, while they may expect the highest rewards and honors from their sovereign in case of success, have always reason to apprehend the worst of consequences to themselves in case of failure. The night after the battle of Salamis, accordingly, Mardonius was in great fear. He did not distrust the future success of the expedition if it were allowed to go on; but, knowing the character of such despots as those who ruled great nations in that age of the world, he was well aware that he might reasonably expect, at any moment, the appearance of officers sent from Xerxes to cut off his head.

His anxiety was increased by observing that Xerxes seemed very much depressed, and very restless and uneasy, after the battle, as if he were revolving in his mind some extraordinary design. He presently thought that he perceived indications that the king was planning a retreat. Mardonius, after much hesitation, concluded to speak to him, and endeavor to dispel his anxieties and fears, and lead him to take a more favorable view of the prospects of the expedition. He accordingly accosted him on the subject somewhat as follows:

"It is true," said he, "that we were not as successful in the combat yesterday as we desired to be; but this reverse, as well as all the preceding disasters that we have met with, is, after all, of comparatively little moment. Your majesty has gone steadily on, accomplishing most triumphantly all the substantial objects aimed at in undertaking the expedition. Your troops have advanced successfully by land against all opposition. With them you have traversed Thrace, Macedon, and Thessaly. You have fought your way, against the most desperate resistance, through the Pass of Thermopylae. You have overrun all Northern Greece. You have burned Athens. Thus, far from there being any uncertainty or doubt in respect to the success of the expedition, we see that all the great objects which you proposed by it are already accomplished. The fleet, it is true, has now suffered extensive damage; but we must remember that it is upon the army, not upon the fleet, that our hopes and expectations mainly depend. The army is safe; and it can not be possible that the Greeks can hereafter bring any force into the field by which it can be seriously endangered."

By these and similar sentiments, Mardonius endeavored to revive and restore the failing courage and resolution of the king. He found, however, that he met with very partial success. Xerxes was silent, thoughtful, and oppressed apparently with a sense of anxious concern. Mardonius finally proposed that, even if the king should think it best to return himself to Susa, he should not abandon the enterprise of subduing Greece, but that he should leave a portion of the army under his (Mardonius's) charge, and he would undertake, he said, to complete the work which had been so successfully begun. Three hundred thousand men, he was convinced, would be sufficient for the purpose.

This suggestion seems to have made a favorable impression on the mind of Xerxes. He was disposed, in fact, to be pleased with any plan, provided it opened the way for his own escape from the dangers in which he imagined that he was entangled. He said that he would consult some of the other commanders upon the subject. He did so, and then, before coming to a final decision, he determined to confer with Artemisia. He remembered that she had counseled him not to attack the Greeks at Salamis, and, as the result had proved that counsel to be eminently wise, he felt the greater confidence in asking her judgment again.

He accordingly sent for Artemisia, and, directing all the officers, as well as his own attendants, to retire, he held a private consultation with her in respect to his plans.

"Mardonius proposes," said he, "that the expedition should on no account be abandoned in consequence of this disaster, for he says that the fleet is a very unimportant part of our force, and that the army still remains unharmed. He proposes that, if I should decide myself to return to Persia, I should leave three hundred thousand men with him, and he undertakes, if I will do so, to complete, with them, the subjugation of Greece. Tell me what you think of this plan. You evinced so much sagacity in foreseeing the result of this engagement at Salamis, that I particularly wish to know your opinion."

Artemisia, after pausing a little to reflect upon the subject, saying, as she hesitated, that it was rather difficult to decide, under the extraordinary circumstances in which they were placed, what it really was best to do, came at length to the conclusion that it would be wisest for the king to accede to Mardonius's proposal. "Since he offers, of his own accord, to remain and undertake to complete the subjugation of Greece, you can, very safely to yourself, allow him to make the experiment. The great object which was announced as the one which you had chiefly in view in the invasion of Greece, was the burning of Athens. This is already accomplished. You have done, therefore, what you undertook to do, and can, consequently, now return yourself, without dishonor. If Mardonius succeeds in his attempt, the glory of it will redound to you. His victories will be considered as only the successful completion of what you began. On the other hand, if he fails, the disgrace of failure will be his alone, and the injury will be confined to his destruction. In any event, your person, your interests, and your honor are safe, and if Mardonius is willing to take the responsibility and incur the danger involved in the plan that he proposes, I would give him the opportunity."

Xerxes adopted the view of the subject which Artemisia thus presented with the utmost readiness and pleasure. That advice is always very welcome which makes the course that we had previously decided upon as the most agreeable seem the most wise. Xerxes immediately determined on returning to Persia himself, and leaving Mardonius to complete the conquest. In carrying out this design, he concluded to march to the northward by land, accompanied by a large portion of his army and by all his principal officers, until he reached the Hellespont. Then he was to give up to Mardonius the command of such troops as should be selected to remain in Greece, and, crossing the Hellespont, return himself to Persia with the remainder.

If, as is generally the case, it is a panic that causes a flight, a flight, in its turn, always increases a panic. It happened, in accordance with this general law, that, as soon as the thoughts of Xerxes were once turned toward an escape from Greece, his fears increased, and his mind became more and more the prey of a restless uneasiness and anxiety lest he should not be able to effect his escape. He feared that the bridge of boats would have been broken down, and then how would he be able to cross the Hellespont? To prevent the Greek fleet from proceeding to the northward, and thus intercepting his passage by destroying the bridge, he determined to conceal, as long as possible, his own departure. Accordingly, while he was making the most efficient and rapid arrangements on the land for abandoning the whole region, he brought up his fleet by sea, and began to build, by means of the ships, a floating bridge from the main land to the island of Salamis, as if he were intent only on advancing. He continued this work all day, postponing his intended retreat until the night should come, in order to conceal his movements. In the course of the day he placed all his family and family relatives on board of Artemisia's ship, under the charge of a tried and faithful domestic. Artemisia was to convey them, as rapidly as possible, to Ephesus, a strong city in Asia Minor, where Xerxes supposed that they would be safe.

In the night the fleet, in obedience to the orders which Xerxes had given them, abandoned their bridge and all their other undertakings, and set sail. They were to make the best of their way to the Hellespont, and post themselves there to defend the bridge of boats until Xerxes should arrive. On the following morning, accordingly, when the sun rose, the Greeks found, to their utter astonishment, that their enemies were gone.

A scene of the greatest animation and excitement on board the Greek fleet at once ensued. The commanders resolved on an immediate pursuit. The seamen hoisted their sails, raised their anchors, and manned their oars, and the whole squadron was soon in rapid motion. The fleet went as far as to the island of Andros, looking eagerly all around the horizon, in every direction, as they advanced, but no signs of the fugitives were to be seen. The ships then drew up to the shore, and the commanders were convened in an assembly, summoned by Eurybiades, on the land, for consultation.

A debate ensued, in which the eternal enmity and dissension between the Athenian and Peloponnesian Greeks broke out anew. There was, however, now some reason for the disagreement. The Athenian cause was already ruined. Their capital had been burned, their country ravaged, and their wives and children driven forth to exile and misery. Nothing remained now for them but hopes of revenge. They were eager, therefore, to press on, and overtake the Persian galleys in their flight, or, if this could not be done, to reach the Hellespont before Xerxes should arrive there, and intercept his passage by destroying the bridge. This was the policy which Themistocles advocated. Eurybiades, on the other hand, and the Peloponnesian commanders, urged the expediency

of not driving the Persians to desperation by harassing them too closely on their retreat. They were formidable enemies after all, and, if they were now disposed to retire and leave the country, it was the true policy of the Greeks to allow them to do so. To destroy the bridge of boats would only be to take effectual measures for keeping the pest among them. Themistocles was outvoted. It was determined best to allow the Persian forces to retire.

Themistocles, when he found that his counsels were overruled, resorted to another of the audacious stratagems that marked his career, which was to send a second pretended message of friendship to the Persian king. He employed the same Sicinnus on this occasion that he had sent before into the Persian fleet, on the eve of the battle of Salamis. A galley was given to Sicinnus, with a select crew of faithful men. They were all put under the most solemn oaths never to divulge to any person, under any circumstances, the nature and object of their commission. With this company, Sicinnus left the fleet secretly in the night, and went to the coast of Attica. Landing here, he left the galley, with the crew in charge of it, upon the shore, and, with one or two select attendants, he made his way to the Persian camp, and desired an interview with the king. On being admitted to an audience, he said to Xerxes that he had been sent to him by Themistocles, whom he represented as altogether the most prominent man among the Greek commanders, to say that the Greeks had resolved on pressing forward to the Hellespont, to intercept him on his return, but that he, Themistocles, had dissuaded them from it, under the influence of the same friendship for Xerxes which had led him to send a friendly communication to the Persians before the late battle; that, in consequence of the arguments and persuasions of Themistocles, the Greek squadrons would remain where they then were, on the southern coasts, leaving Xerxes to retire without molestation.

All this was false, but Themistocles thought it would serve his purpose well to make the statement; for, in case he should, at any future time, in following the ordinary fate of the bravest and most successful Greek generals, be obliged to fly in exile from his country to save his life, it might be important for him to have a good understanding beforehand with the King of Persia, though a good understanding, founded on pretensions so hypocritical and empty as these, would seem to be worthy of very little reliance. In fact, for a Greek general, discomfited in the councils of his own nation, to turn to the Persian king with such prompt and cool assurance, for the purpose of gaining his friendship by tendering falsehoods so bare and professions so hollow, was an instance of audacious treachery so original and lofty as to be almost sublime.

Xerxes pressed on with the utmost diligence toward the north. The country had been ravaged and exhausted by his march through it in coming down, and now, in returning, he found infinite difficulty in obtaining supplies of food and water for his army. Forty-five days were consumed in getting back to the Hellespont. During all this time the privations and sufferings of the troops increased every day. The soldiers were spent with fatigue, exhausted with hunger, and harassed with incessant apprehensions of attacks from their enemies. Thousands of the sick and wounded that attempted at first to follow the army, gave out by degrees as the columns moved on. Some were left at the encampments; others lay down by the road-sides, in the midst of the day's march, wherever their waning strength finally failed them; and every where broken chariots, dead and dying beasts of burden, and the bodies of soldiers, that lay neglected where they fell, encumbered and choked the way. In a word, all the roads leading toward the northern provinces exhibited in full perfection those awful scenes which usually mark the track of a great army retreating from an invasion.

The men were at length reduced to extreme distress for food. They ate the roots and stems of the herbage, and finally stripped the very bark from the trees and devoured it, in the vain hope that it might afford some nutriment to re-enforce the vital principle, for a little time at least, in the dreadful struggle which it was waging within them. There are certain forms of pestilential disease which, in cases like this, always set in to hasten the work which famine alone would be too slow in performing. Accordingly, as was to have been expected, camp fevers, choleras, and other corrupt and infectious maladies, broke out with great violence as the army advanced along the northern shores of the AEgean Sea; and as every victim to these dreadful and hopeless disorders helped, by his own dissolution, to taint the air for all the rest, the wretched crowd was, in the end, reduced to the last extreme of misery and terror.

At length Xerxes, with a miserable remnant of his troops, arrived at Abydos, on the shores of the Hellespont. He found the bridge broken down. The winds and storms had demolished what the Greeks had determined to spare. The immense structure, which it had cost so much toil and time to rear, had wholly disappeared, leaving no traces of its existence, except the wrecks which lay here and there half buried in the sand along the shore. There were some small boats at hand, and Xerxes, embarking in one of them, with a few attendants in the others, and leaving the exhausted and wretched remnant of his army behind, was rowed across the strait, and landed at last safely again on the Asiatic shores.

[Illustration: THE RETURN OF XERXES TO PERSIA.]

The place of his landing was Sestos. From Sestos he went to Sardis, and from Sardis he proceeded, in a short time, to Susa. Mardonius was left in Greece. Mardonius was a general of great military experience and skill, and, when left to himself, he found no great difficulty in reorganizing the army, and in putting it again in an efficient condition. He was not able, however, to accomplish the undertaking which he had engaged to perform. After various adventures, prosperous and adverse, which it would be foreign to our purpose here to detail, he was at last defeated in a great battle, and killed on the field. The Persian army was now obliged to give up the contest, and was expelled from Greece finally and forever.

When Xerxes reached Susa, he felt overjoyed to find himself once more safe, as he thought, in his own palaces. He looked back upon the hardships, exposures, and perils through which he had passed, and, thankful for having so narrowly escaped from them, he determined to encounter no such hazards again. He had had enough of ambition and glory. He was now going to devote himself to ease and pleasure. Such a man would not naturally be expected to be very scrupulous in respect to the means of enjoyment, or to the character of the companions whom he would select to share his pleasures, and the life of the king soon presented one continual scene of dissipation, revelry, and vice. He gave himself up to such prolonged carousals, that one night was sometimes protracted through the following day into another. The administration of his government was left wholly to his ministers, and every personal duty was neglected, that he might give himself to the most abandoned and profligate indulgence of his appetites and passions.

He had three sons who might be considered as heirs to his throne--Darius, Hystaspes, and Artaxerxes. Hystaspes was absent in a neighboring province. The others were at home. He had also a very prominent officer in his court, whose name, Artabanus, was the same with that of the uncle who had so strongly attempted to dissuade him from undertaking the conquest of Greece. Artabanus the uncle disappears finally from view at the time when Xerxes dismissed him to return to Susa at the first crossing of the Hellespont. This second Artabanus was the captain of the king's body-guard and, consequently, the common executioner of the despot's decrees. Being thus established in his palace, surrounded by his family, and protected by Artabanus and his guard, the monarch felt that all his toils and dangers were over, and that there was nothing now before him but a life of ease, of pleasure, and of safety. Instead of this, he was, in fact, in the most imminent danger. Artabanus was already plotting his destruction.

One day, in the midst of one of his carousals, he became angry with his oldest son Darius for some cause, and gave Artabanus an order to kill him. Artabanus neglected to obey this order. The king had been excited with wine when he gave it, and Artabanus supposed that all recollection of the command would pass away from his mind with the excitement that occasioned it. The king did not, however, so readily forget. The next day he demanded why his order had not been obeyed. Artabanus now began to fear for his own safety, and he determined to proceed at once to the execution of a plan which he had long been revolving, of destroying the whole of Xerxes's family, and placing himself on the throne in their stead. He contrived to bring the king's chamberlain into his schemes, and, with the connivance and aid of this officer, he went at night into the king's bed-chamber, and murdered the monarch in his sleep.

Leaving the bloody weapon with which the deed had been perpetrated by the side of the victim, Artabanus went immediately into the bed-chamber of Artaxerxes, the youngest son, and, awaking him suddenly, he told him, with tones of voice and looks expressive of great excitement and alarm, that his father had been killed, and that it was his brother Darius that had killed him. "His motive is," continued Artabanus, "to obtain the throne, and, to make the more sure of an undisturbed possession of it, he is intending to murder you next. Rise, therefore, and defend your life."

Artaxerxes was aroused to a sudden and uncontrollable paroxysm of anger at this intelligence. He seized his weapon, and rushed into the apartment of his innocent brother, and slew him on the spot. Other summary assassinations of a similar kind followed in this complicated tragedy. Among the victims, Artabanus and all his adherents were slain, and at length Artaxerxes took quiet possession of the throne, and reigned in his father's stead.

THE END.

SOJOURNER TRUTH, THE LIBYAN SIBYL by Harriet Beecher Stowe

Many years ago, the few readers of radical Abolitionist papers must often have seen the singular name of Sojourner Truth, announced as a frequent speaker at Anti-Slavery meetings, and as travelling on a sort of self-appointed agency through the country. I had myself often remarked the name, but never met the individual. On one occasion, when our house was filled with company, several eminent clergymen being our guests, notice was brought up to me that Sojourner Truth was below, and requested an interview. Knowing nothing of her but her singular name, I went down, prepared to make the interview short, as the pressure of many other engagements demanded.

When I went into the room, a tall, spare form arose to meet me. She was evidently a full-blooded African, and though now aged and worn with many hardships, still gave the impression of a physical development which in early youth must have been as fine a specimen of the torrid zone as Cumberworth's celebrated statuette of the Negro Woman at the Fountain. Indeed, she so strongly reminded me of that figure, that, when I recall the events of her life, as she narrated them to me, I imagine her as a living, breathing impersonation of that work of art.

I do not recollect ever to have been conversant with any one who had more of that silent and subtle power which we call personal presence than this woman. In the modern Spiritualistic phraseology, she would be described as having a strong sphere. Her tall form, as she rose up before me, is still vivid to my mind. She was dressed in some stout, grayish stuff, neat and clean, though dusty from travel. On her head, she wore a bright Madras handkerchief, arranged as a turban, after the manner of her race. She seemed perfectly self-possessed and at her ease,--in fact, there was almost an unconscious superiority, not unmixed with a solemn twinkle of humor, in the odd, composed manner in which she looked down on me. Her whole air had at times a gloomy sort of drollery

which impressed one strangely.

"So this is YOU," she said.

"Yes," I answered.

"Well, honey, de Lord bless ye! I jes' thought I'd like to come an' have a look at ye. You's heerd o' me, I reckon?" she added.

"Yes, I think I have. You go about lecturing, do you not?"

"Yes, honey, that's what I do. The Lord has made me a sign unto this nation, an' I go round a'testifyin', an' showin' on 'em their sins agin my people."

So saying, she took a seat, and, stooping over and crossing her arms on her knees, she looked down on the floor, and appeared to fall into a sort of reverie. Her great gloomy eyes and her dark face seemed to work with some undercurrent of feeling; she sighed deeply, and occasionally broke out,--

"O Lord! O Lord! Oh, the tears, an' the groans, an' the moans! O Lord!"

I should have said that she was accompanied by a little grandson of ten years,--the fattest, jolliest woolly-headed little specimen of Africa that one can imagine. He was grinning and showing his glistening white teeth in a state of perpetual merriment, and at this moment broke out into an audible giggle, which disturbed the reverie into which his relative was falling.

She looked at him with an indulgent sadness, and then at me.

"Laws, Ma'am, HE don't know nothin' about it--HE don't. Why, I've seen them poor critters, beat an' 'bused an' hunted, brought in all torn,--ears hangin' all in rags, where the dogs been a'bitin' of 'em!"

This set off our little African Puck into another giggle, in which he seemed perfectly convulsed.

She surveyed him soberly, without the slightest irritation.

"Well, you may bless the Lord you CAN laugh; but I tell you, 't wa'n't no laughin' matter."

By this time I thought her manner so original that it might be worth while to call down my friends; and she seemed perfectly well pleased with the idea. An audience was what she wanted,--it mattered not whether high or low, learned or ignorant. She had things to say, and was ready to say them at all times, and to any one.

I called down Dr. Beecher, Professor Allen, and two or three other clergymen, who, together with my husband and family, made a roomful. No princess could have received a drawing-room with more composed dignity than Sojourner her audience. She stood among them, calm and erect, as one of her own native palm-trees waving alone in the desert. I presented one after another to her, and at last said,--

"Sojourner, this is Dr. Beecher. He is a very celebrated preacher."

"IS he?" she said, offering her hand in a condescending manner, and looking down on his white head. "Ye dear lamb, I'm glad to see ye! De Lord bless ye! I loves preachers. I'm a kind o' preacher myself."

"You are?" said Dr. Beecher. "Do you preach from the Bible?"

"No, honey, can't preach from de Bible,--can't read a letter."

"Why, Sojourner, what do you preach from, then?"

Her answer was given with a solemn power of voice, peculiar to herself, that hushed every one in the room.

"When I preaches, I has jest one text to preach from, an' I always preaches from this one. MY text is, 'WHEN I FOUND JESUS.'"

"Well, you couldn't have a better one," said one of the ministers.

She paid no attention to him, but stood and seemed swelling with her own thoughts, and then began this narration:--

"Well, now, I'll jest have to go back, an' tell ye all about it. Ye see, we was all brought over from Africa, father an' mother an' I, an' a lot more of us; an' we was sold up an' down, an' hither an' yon; an' I can 'member, when I was a little thing, not bigger than this 'ere," pointing to her grandson, "how my ole mammy would sit out o' doors in the evenin', an' look up at the stars an' groan. She'd groan an' groan, an' says I to her,--

"'Mammy, what makes you groan so?'

"an' she'd say,--

"'Matter enough, chile! I'm groanin' to think o' my poor children: they don't know where I be, an' I don't know where they be; they looks up at the stars, an' I looks up at the stars, but I can't tell where they be.

"'Now,' she said, 'chile, when you're grown up, you may be sold away from your mother an' all your ole friends, an' have great troubles come on ye; an' when you has these troubles come on ye, ye jes' go to God, an' He'll help ye.'

"An' says I to her,--

"'Who is God, anyhow, mammy?'

"An' says she,--

"'Why, chile, you jes' look up DAR! It's Him that made all DEM!"

"Well, I didn't mind much 'bout God in them days. I grew up pretty lively an' strong, an' could row a boat, or ride a horse, or work round, an' do 'most anything.

"At last I got sold away to a real hard massa an' missis. Oh, I tell you, they WAS hard! 'Peared like I couldn't please 'em, nohow. An' then I thought o' what my old mammy told me about God; an' I thought I'd got into trouble, sure enough, an' I wanted to find God, an' I heerd some one tell a story about a man that met God on a threshin'-floor, an' I thought, 'Well an' good, I'll have a threshin'-floor, too.' So I went down in the lot, an' I threshed down a place real hard, an' I used to go down there every day, an' pray an' cry with all my might, a-prayin' to the Lord to make my massa an' missis better, but it didn't seem to do no good; an' so says I, one day,--

"'O God, I been a-askin' ye, an' askin' ye, an' askin' ye, for all this long time, to make my massa an' missis better, an' you don't do it, an' what CAN be the reason? Why, maybe you CAN'T. Well, I shouldn't wonder ef you couldn't. Well, now, I tell you, I'll make a bargain with you. Ef you'll help me to git away from my massa an' missis, I'll agree to be good; but ef you don't help me, I really don't think I can be. Now,' says I, 'I want to git away; but the trouble's jest here: ef I try to git away in the night, I can't see; an' ef I try to git away in the daytime, they'll see me, an' be after me.'

"Then the Lord said to me, 'Git up two or three hours afore daylight, an' start off.'

"An' says I, 'Thank 'ee, Lord! that's a good thought.'

"So up I got, about three o'clock in the mornin', an' I started an' travelled pretty fast, till, when the sun rose, I was clear away from our place an' our folks, an' out o' sight. An' then I begun to think I didn't know nothin' where to go. So I kneeled down, and says I,--

"'Well, Lord, you've started me out, an' now please to show me where to go.'

"Then the Lord made a house appear to me, an' He said to me that I was to walk on till I saw that house, an' then go in an' ask the people to take me. An' I travelled all day, an' didn't come to the house till late at night; but when I saw it, sure enough, I went in, an' I told the folks that the Lord sent me; an' they was Quakers, an' real kind they was to me. They jes' took me in, an' did for me as kind as ef I'd been one of 'em; an' after they'd giv me supper, they took me into a room where there was a great, tall, white bed; an' they told me to sleep there. Well, honey, I was kind o' skeered when they left me alone with that great white bed; 'cause I never had been in a bed in my life. It never came into my mind they could mean me to sleep in it. An' so I jes' camped down under it, on the floor, an' then I slep' pretty well. In the mornin', when they came in, they asked me ef I hadn't been asleep; an' I said, 'Yes, I never slep' better.' An' they said, 'Why, you haven't been in the bed!' An' says I, 'Laws, you didn't think o' such a thing as my sleepin' in dat 'ar' BED, did you? I never heerd o' such a thing in my life.'

"Well, ye see, honey, I stayed an' lived with 'em. An' now jes' look here: instead o' keepin' my promise an' bein' good, as I told the Lord I would, jest as soon as everything got a'goin' easy, I FORGOT ALL ABOUT GOD.

"Pretty well don't need no help; an' I gin up prayin.' I lived there two or three years, an' then the slaves in New York were all set free, an' ole massa came to our home to make a visit, an' he asked me ef I didn't want to go back an' see the folks on the ole place. An' I told him I did. So he said, ef I'd jes' git into the wagon with him, he'd carry me over. Well, jest as I was goin' out to git into the wagon, I MET GOD! an' says I, 'O God, I didn't know as you was so great!' An' I turned right round an' come into the house, an' set down in my room; for 't was God all around me. I could feel it burnin', burnin', burnin' all around me, an' goin' through me; an' I saw I was so wicked, it seemed as ef it would burn me up. An' I said, 'O somebody, somebody, stand between God an' me! for it burns me!' Then, honey, when I said so, I felt as it were somethin' like an amberill [umbrella] that came between me an' the light, an' I felt it was SOMEBODY,--somebody that stood between me an' God; an' it felt cool, like a shade; an' says I, 'Who's this that stands between me an' God? Is it old Cato?' He was a pious old preacher; but then I seemed to see Cato in the light, an' he was all polluted an' vile, like me; an' I said, 'Is it old Sally?' an' then I saw her, an' she seemed jes' so. An' then says I, 'WHO is this?' An' then, honey, for a while it was like the sun shinin' in a pail o' water, when it moves up an' down; for I begun to feel 't was somebody that loved me; an' I tried to know him. An' I said, 'I know you! I know you! I know you!'--an' then I said, 'I don't know you! I don't know you! I don't know you!' An' when I said, 'I know you, I know you,' the light came; an' when I said, 'I don't know you, I don't know you,' it went, jes' like the sun in a pail o' water. An' finally somethin' spoke out in me an' said, 'THIS IS JESUS!' An' I spoke out with all my might, an' says I, 'THIS IS JESUS! Glory be to God!' An' then the whole world grew bright, an' the trees they waved an' waved in glory, an' every little bit o' stone on the ground shone like glass; an' I shouted an' said, 'Praise, praise, praise to the Lord!' An' I begun to feel such a love in my soul as I never felt before,--love to all creatures. An' then, all of a sudden, it stopped, an' I said, 'Dar's de white folks, that have abused you an' beat you an' abused your people,--think o' them!' But then there came another rush of love through my soul, an' I cried out loud,--'Lord, Lord, I can love EVEN DE WHITE FOLKS!'

"Honey, I jes' walked round an' round in a dream. Jesus loved me! I knowed it,--I felt it. Jesus was my Jesus. Jesus would love me always. I didn't dare tell nobody; 't was a great secret. Everything had been got away from me that I ever had; an' I thought that ef I let white folks know about this, maybe they'd get HIM away,--so I said, 'I'll keep this close. I won't let any one know.'"

"But, Sojourner, had you never been told about Jesus Christ?"

"No, honey. I hadn't heerd no preachin',--been to no meetin'. Nobody hadn't told me. I'd kind o' heerd of Jesus, but thought he was like Gineral Lafayette, or some o' them. But one night there was a Methodist meetin' somewhere in our parts, an' I went; an' they got up an' begun for to tell der 'speriences; an' de fust one begun to speak. I started, 'cause he told about Jesus. 'Why,' says I to myself, 'dat man's found him, too!' An' another got up an' spoke, an I said, 'He's found him, too!' An' finally I said, 'Why, they all know him!' I was so happy! An' then they sung this hymn": (Here Sojourner sang, in a strange, cracked voice, but evidently with all her soul and might, mispronouncing the English, but seeming to derive as much elevation and comfort from bad English as from good):--

'There is a holy city, A world of light above, Above the stairs and regions,* Built by the God of Love.

"An Everlasting temple, And saints arrayed in white There serve their great Redeemer And dwell with him in light.

"The meanest child of glory Outshines the radiant sun; But who can speak the splendor Of Jesus on his throne?

"Is this the man of sorrows Who stood at Pilate's bar, Condemned by haughty Herod And by his men of war?

"He seems a mighty conqueror, Who spoiled the powers below, And ransomed many captives From everlasting woe.

"The hosts of saints around him Proclaim his work of grace, The patriarchs and prophets, And all the godly race,

"Who speak of fiery trials And tortures on their way; They came from tribulation To everlasting day.

"And what shall be my journey, How long I'll stay below, Or what shall be my trials, Are not for me to know.

"In every day of trouble I'll raise my thoughts on high, I'll think of that bright temple And crowns above the sky."

* Starry regions.

I put in this whole hymn, because Sojourner, carried away with her own feeling, sang it from beginning to end with a triumphant energy that held the whole circle around her intently listening. She sang with the strong barbaric accent of the native African, and with those indescribable upward turns and those deep gutturals which give such a wild, peculiar power to the negro singing,--but above all, with such an overwhelming energy of personal appropriation that the hymn seemed to be fused in the furnace of her feelings and come out recrystallized as a production of her own.

It is said that Rachel was wont to chant the "Marseillaise" in a manner that made her seem, for the time, the very spirit and impersonation of the gaunt, wild, hungry, avenging mob which rose against aristocratic oppression; and in like manner, Sojourner, singing this hymn, seemed to impersonate the fervor of Ethiopia, wild, savage, hunted of all nations, but burning after God in her tropic heart, and stretching her scarred hands towards the glory to be revealed.

"Well, den ye see, after a while, I thought I'd go back an' see de folks on de ole place. Well, you know, de law had passed dat de culled folks was all free; an' my old missis, she had a daughter married about dis time who went to live in Alabama,--an' what did she do but give her my son, a boy about de age of dis yer, for her to take down to Alabama? When I got back to de ole place, they told me about it, an' I went right up to see ole missis, an' says I,--

"'Missis, have you been an' sent my son away down to Alabama?'

"'Yes, I have,' says she; 'he's gone to live with your young missis.'

"'Oh, Missis,' says I, 'how could you do it?'

"'Poh!' says she, 'what a fuss you make about a little nigger! Got more of 'em now than you know what to do with.'

"I tell you, I stretched up. I felt as tall as the world!

"'Missis,' says I, 'I'LL HAVE MY SON BACK AGIN!'

"She laughed.

"'YOU will, you nigger? How you goin' to do it? You ha'n't got no money."

"'No, Missis,--but GOD has,--an' you'll see He'll help me!'--an' I turned round an' went out.

"Oh, but I WAS angry to have her speak to me so haughty an' so scornful, as ef my chile wasn't worth anything. I said to God, 'O Lord, render unto her double!' It was a dreadful prayer, an' I didn't know how true it would come.

"Well, I didn't rightly know which way to turn; but I went to the Lord, an' I said to Him, 'O Lord, ef I was as rich as you be, an' you was as poor as I be, I'd help you,--you KNOW I would; and, oh, do help me!' An' I felt sure then that He would.

"Well, I talked with people, an' they said I must git the case before a grand jury. So I went into the town when they was holdin' a court, to see ef I could find any grand jury. An' I stood round the court-house, an' when they was a-comin' out, I walked right up to the grandest-lookin' one I could see, an' says I to him,--

"'Sir, be you a grand jury?'

"An' then he wanted to know why I asked, an' I told him all about it; an' he asked me all sorts of questions, an' finally he says to me,--

"'I think, ef you pay me ten dollars, that I'd agree to git your son for you.' An' says he, pointin' to a house over the way, 'You go 'long an' tell your story to the folks in that house, an' I guess they'll give you the money.'

"Well, I went, an' I told them, an' they gave me twenty dollars; an' then I thought to myself, 'Ef ten dollars will git him, twenty dollars will git him SARTIN.' So I carried it to the man all out, an' said,--

"'Take it all,--only be sure an' git him.'

"Well, finally they got the boy brought back; an' then they tried to frighten him, an' to make him say that I wasn't his mammy, an' that he didn't know me; but they couldn't make it out. They gave him to me, an' I took him an' carried him home; an' when I came to take off his clothes, there was his poor little back all covered with scars an' hard lumps, where they'd flogged him.

"Well, you see, honey, I told you how I prayed the Lord to render unto her double. Well, it came true; for I was up at ole missis' house not long after, an' I heerd 'em readin' a letter to her how her daughter's husband had murdered her,--how he'd thrown her down an' stamped the life out of her, when he was in liquor; an' my ole missis, she giv a screech, an' fell flat on the floor. Then says I, 'O Lord, I didn't mean all that! You took me up too quick.'

"Well, I went in an' tended that poor critter all night. She was out of her mind,--a-cryin', an' callin' for her daughter; an' I held her poor ole head on my arm, an' watched for her as ef she'd been my babby. An' I watched by her, an' took care on her all through her sickness after that, an' she died in my arms, poor thing!"

"Well, Sojourner, did you always go by this name?"

"No, 'deed! My name was Isabella; but when I left the house of bondage, I left everything behind. I wa'n't goin' to keep nothin' of Egypt on me, an' so I went to the Lord an' asked Him to give me a new name. And the Lord gave me Sojourner, because I was to travel up an' down the land, showin' the people their sins, an' bein' a sign unto them. Afterwards I told the Lord I wanted another name, 'cause everybody else had two names; and the Lord gave me Truth, because I was to declare the truth to the people.

"Ye see some ladies have given me a white satin banner," she said, pulling out of her pocket and unfolding a white banner, printed with many texts, such as, "Proclaim liberty throughout all the land unto all the inhabitants thereof," and others of like nature. "Well," she said, "I journeys round to camp-meetins, an' wherever folks is, an' I sets up my banner, an' then I sings, an' then folks always comes up round me, an' then I preaches to 'em. I tells 'em about Jesus, an' I tells 'em about the sins of this people. A great many always comes to hear me; an' they're right good to me, too, an' say they want to hear me agin."

We all thought it likely; and as the company left her, they shook hands with her, and thanked her for her very original sermon; and one of the ministers was overheard to say to another, "There's more of the gospel in that story than in most sermons."

Sojourner stayed several days with us, a welcome guest. Her conversation was so strong, simple, shrewd, and with such a droll flavoring of humor, that the Professor was wont to say of an evening, "Come, I am dull, can't you get Sojourner up here to talk a little?" She would come up into the parlor, and sit among pictures and ornaments, in her simple stuff gown, with her heavy travelling-shoes, the central object of attention both to parents and children, always ready to talk or to sing, and putting into the common flow of conversation the keen edge of some shrewd remark.

"Sojourner, what do you think of Women's Rights?"

"Well, honey, I's ben to der meetins, an' harked a good deal. Dey wanted me for to speak. So I got up. Says I,--'Sisters, I a'n't clear what you'd be after. Ef women want any rights more 'n dey's got, why don't dey jes' TAKE 'EM, an' not be talkin' about it?' Some on 'em came round me, an' asked why I didn't wear Bloomers. An' I told 'em I had Bloomers enough when I was in bondage. You see," she said, "dey used to weave what dey called nigger-cloth, an' each one of us got jes' sech a strip, an' had to wear it width-wise. Them that was short got along pretty well, but as for me"--She gave an indescribably droll glance at her long limbs and then at us, and added,--"Tell YOU, I had enough of Bloomers in them days."

Sojourner then proceeded to give her views of the relative capacity of the sexes, in her own way.

"S'pose a man's mind holds a quart, an' a woman's don't hold but a pint; ef her pint is FULL, it's as good as his quart."

Sojourner was fond of singing an extraordinary lyric, commencing,--

"I'm on my way to Canada, That cold, but happy land; The dire effects of Slavery I can no longer stand. O righteous Father, Do look down on me, And help me on to Canada, Where colored folks are free!"

The lyric ran on to state, that, when the fugitive crosses the Canada line,

"The Queen comes down unto the shore, With arms extended wide, To welcome the poor fugitive Safe onto Freedom's side."

In the truth thus set forth she seemed to have the most simple faith.

But her chief delight was to talk of "glory," and to sing hymns whose burden was,--

"O glory, glory, glory, Won't you come along with me?"

and when left to herself, she would often hum these with great delight, nodding her head.

On one occasion, I remember her sitting at a window singing and fervently keeping time with her head, the little black Puck of a grandson meanwhile amusing himself with ornamenting her red-and-yellow turban with green dandelion-curls, which shook and trembled with her emotions, causing him perfect convulsions of delight.

"Sojourner," said the Professor to her, one day, when he heard her singing, "you seem to be very sure about heaven."

"Well, I be," she answered, triumphantly.

"What makes you so sure there is any heaven?"

"Well, 'cause I got such a hankerin' arter it in here," she said,--giving a thump on her breast with her usual energy.

There was at the time an invalid in the house, and Sojourner, on learning it, felt a mission to go and comfort her. It was curious to see the tall, gaunt, dusky figure stalk up to the bed with such an air of conscious authority, and take on herself the office of consoler with such a mixture of authority and tenderness. She talked as from above,--and at the same time, if a pillow needed changing or any office to be rendered, she did it with a strength and handiness that inspired trust. One felt as if the dark, strange woman were quite able to take up the invalid in her bosom, and bear her as a lamb, both physically and spiritually. There was both power and sweetness in that great warm soul and that vigorous frame.

At length, Sojourner, true to her name, departed. She had her mission elsewhere. Where now she is I know not; but she left deep memories behind her.

To these recollections of my own I will add one more anecdote, related by Wendell Phillips.

Speaking of the power of Rachel to move and bear down a whole audience by a few simple words, he said he never knew but one other human being that had that power, and that other was Sojourner Truth. He related a scene of which he was witness. It was at a crowded public meeting in Faneuil Hall, where Frederick Douglas was one of the chief speakers. Douglas had been describing the wrongs of the black race, and as he proceeded, he grew more and more excited, and finally ended by saying that they had no hope of justice from the whites, no possible hope except in their own right arms. It must come to blood; they must fight for themselves, and redeem themselves, or it would never be done.

Sojourner was sitting, tall and dark, on the very front seat, facing the platform; and in the hush of deep feeling, after Douglas sat down, she spoke out in her deep, peculiar voice, heard all over the house,--

"Frederick, IS GOD DEAD?"

The effect was perfectly electrical, and thrilled through the whole house, changing as by a flash the whole feeling of the audience. Not another word she said or needed to say; it was enough.

It is with a sad feeling that one contemplates noble minds and bodies, nobly and grandly formed human beings, that have come to us cramped, scarred, maimed, out of the prison-house of bondage. One longs to know what such beings might have become, if suffered to unfold and expand under the kindly developing influences of education.

It is the theory of some writers, that to the African is reserved, in the later and palmier days of the earth, the full and harmonious development of the religious element in man. The African seems to seize on the tropical fervor and luxuriance of Scripture imagery as something native; he appears to feel himself to be of the same blood with those old burning, simple souls, the patriarchs, prophets, and seers, whose impassioned words seem only grafted as foreign plants on the cooler stock of the Occidental mind.

I cannot but think that Sojourner with the same culture might have spoken words as eloquent and undying as those of the African Saint Augustine or Tertullian. How grand and queenly a woman she might have been, with her wonderful physical vigor, her great heaving sea of emotion, her power of spiritual conception, her quick penetration, and her boundless energy! We might conceive an African type of woman so largely made and moulded, so much fuller in all the elements of life, physical and spiritual, that the dark hue of the skin should seem only to add an appropriate charm,--as Milton says of his Penseroso, whom he imagines

"Black, but such as in esteem Prince Memnon's sister might beseem, Or that starred Ethiop queen that strove To set her beauty's praise above The sea-nymph's."

But though Sojourner Truth has passed away from among us as a wave of the sea, her memory still lives in one of the loftiest and most original works of modern art, the Libyan Sibyl, by Mr. Story, which attracted so much attention in the late World's Exhibition. Some years ago, when visiting Rome, I related Sojourner's history to Mr. Story at a breakfast at his house. Already had his mind begun to turn to Egypt in search of a type of art which should represent a larger and more vigorous development of nature than the cold elegance of Greek lines. His glorious Cleopatra was then in process of evolution, and his mind was working out the problem of her broadly developed nature, of all that slumbering weight and fulness of passion with which this statue seems charged, as a heavy thunder-cloud is charged with electricity.

The history of Sojourner Truth worked in his mind and led him into the deeper recesses of the African nature,--those unexplored depths of being and feeling, mighty and dark as the gigantic depths of tropical forests, mysterious as the hidden rivers and mines of that burning continent whose life-history is yet to be. A few days after, he told me that he had conceived the idea of a statue which he should call the Libyan Sibyl. Two years subsequently, I revisited Rome, and found the gorgeous Cleopatra finished, a thing to marvel at, as the creation of a new style of beauty, a new manner of art. Mr. Story requested me to come and repeat to him the history of Sojourner Truth, saying that the conception had never left him. I did so; and a day or two after, he showed me the clay model of the Libyan Sibyl. I have never seen the marble statue; but am told by those who have, that it was by far the most impressive work of art at the Exhibition.

A notice of the two statues from the London "Athenaeum" must supply a description which I cannot give.

"The Cleopatra and the Sibyl are seated, partly draped, with the characteristic Egyptian gown, that gathers about the torso and falls freely around the limbs; the first is covered to the bosom, the second bare to the hips. Queenly Cleopatra rests back against her chair in meditative ease, leaning her cheek against one hand, whose elbow the rail of the seat sustains; the other is outstretched upon her knee, nipping its forefinger upon the thumb thoughtfully, as though some firm, wilful purpose filled her brain, as it seems to set those luxurious features to a smile as if the whole woman 'would.' Upon her head is the coif, bearing in front the mystic uraeus, or twining basilisk of sovereignty, while from its sides depend the wide Egyptian lappels, or wings, that fall upon her shoulders. The Sibilla Libica has crossed her knees,--an action universally held amongst the ancients as indicative of reticence or secrecy, and of power to bind. A secret-keeping looking dame she is, in the full-bloom proportions of ripe womanhood, wherein choosing to place his figure the sculptor has deftly gone between the disputed point whether these women were blooming and wise in youth, or deeply furrowed with age and burdened with the knowledge of centuries, as Virgil, Livy, and Gellius say. Good artistic example might be quoted on both sides. Her forward elbow is propped upon one knee; and to keep her secrets close, for this Libyan woman is the closest of all the Sibyls, she rests her shut mouth upon one closed palm, as if holding the African mystery deep in the brooding brain that looks out through mournful, warning eyes, seen under the wide shade of the strange horned (ammonite) crest, that bears the mystery of the Tetragrammaton upon its upturned front. Over her full bosom, mother of myriads as she was, hangs the same symbol. Her face has a Nubian cast, her hair wavy and plaited, as is meet."

We hope to see the day when copies both of the Cleopatra and the Libyan Sibyl shall adorn the Capitol at Washington.

RECONSTRUCTION by Frederick Douglass

The assembling of the Second Session of the Thirty-ninth Congress may very properly be made the occasion of a few earnest words on the already much-worn topic of reconstruction.

Seldom has any legislative body been the subject of a solicitude more intense, or of aspirations more sincere and ardent. There are the best of reasons for this profound interest. Questions of vast moment, left undecided by the last session of Congress, must be manfully grappled with by this. No political skirmishing will avail. The occasion demands statesmanship.

Whether the tremendous war so heroically fought and so victoriously ended shall pass into history a miserable failure, barren of permanent results,--a scandalous and shocking waste of blood and treasure,--a strife for empire, as Earl Russell characterized it, of no value to liberty or civilization,--an attempt to re-establish a Union by force, which must be the merest mockery of a Union,--an effort to bring under Federal authority States into which no loyal man from the North may safely enter, and to bring men into the national councils who deliberate with daggers and vote with revolvers, and who do not even conceal their deadly hate of the country that conquered them; or whether, on the other hand, we shall, as the rightful reward of victory over treason, have a solid nation, entirely delivered from all contradictions and social antagonisms, based upon loyalty, liberty, and equality, must be determined one way or the other by the present session of Congress. The last session really did nothing which can be considered

final as to these questions. The Civil Rights Bill and the Freedmen's Bureau Bill and the proposed constitutional amendments, with the amendment already adopted and recognized as the law of the land, do not reach the difficulty, and cannot, unless the whole structure of the government is changed from a government by States to something like a despotic central government, with power to control even the municipal regulations of States, and to make them conform to its own despotic will. While there remains such an idea as the right of each State to control its own local affairs,--an idea, by the way, more deeply rooted in the minds of men of all sections of the country than perhaps any one other political idea,--no general assertion of human rights can be of any practical value. To change the character of the government at this point is neither possible nor desirable. All that is necessary to be done is to make the government consistent with itself, and render the rights of the States compatible with the sacred rights of human nature.

The arm of the Federal government is long, but it is far too short to protect the rights of individuals in the interior of distant States. They must have the power to protect themselves, or they will go unprotected, spite of all the laws the Federal government can put upon the national statute-book.

Slavery, like all other great systems of wrong, founded in the depths of human selfishness, and existing for ages, has not neglected its own conservation. It has steadily exerted an influence upon all around it favorable to its own continuance. And to-day it is so strong that it could exist, not only without law, but even against law. Custom, manners, morals, religion, are all on its side everywhere in the South; and when you add the ignorance and servility of the ex-slave to the intelligence and accustomed authority of the master, you have the conditions, not out of which slavery will again grow, but under which it is impossible for the Federal government to wholly destroy it, unless the Federal government be armed with despotic power, to blot out State authority, and to station a Federal officer at every cross-road. This, of course, cannot be done, and ought not even if it could. The true way and the easiest way is to make our government entirely consistent with itself, and give to every loyal citizen the elective franchise,--a right and power which will be ever present, and will form a wall of fire for his protection.

One of the invaluable compensations of the late Rebellion is the highly instructive disclosure it made of the true source of danger to republican government. Whatever may be tolerated in monarchical and despotic governments, no republic is safe that tolerates a privileged class, or denies to any of its citizens equal rights and equal means to maintain them. What was theory before the war has been made fact by the war.

There is cause to be thankful even for rebellion. It is an impressive teacher, though a stern and terrible one. In both characters it has come to us, and it was perhaps needed in both. It is an instructor never a day before its time, for it comes only when all other means of progress and enlightenment have failed. Whether the oppressed and despairing bondman, no longer able to repress his deep yearnings for manhood, or the tyrant, in his pride and impatience, takes the initiative, and strikes the blow for a firmer hold and a longer lease of oppression, the result is the same,--society is instructed, or may be.

Such are the limitations of the common mind, and so thoroughly engrossing are the cares of common life, that only the few among men can discern through the glitter and dazzle of present prosperity the dark outlines of approaching disasters, even though they may have come up to our very gates, and are already within striking distance. The yawning seam and corroded bolt conceal their defects from the mariner until the storm calls all hands to the pumps. Prophets, indeed, were abundant before the war; but who cares for prophets while their predictions remain unfulfilled, and the calamities of which they tell are masked behind a blinding blaze of national prosperity?

It is asked, said Henry Clay, on a memorable occasion, Will slavery never come to an end? That question, said he, was asked fifty years ago, and it has been answered by fifty years of unprecedented prosperity. Spite of the eloquence of the earnest Abolitionists,--poured out against slavery during thirty years,--even they must confess, that, in all the probabilities of the case, that system of barbarism would have continued its horrors far beyond the limits of the nineteenth century but for the Rebellion, and perhaps only have disappeared at last in a fiery conflict, even more fierce and bloody than that which has now been suppressed.

It is no disparagement to truth, that it can only prevail where reason prevails. War begins where reason ends. The thing worse than rebellion is the thing that causes rebellion. What that thing is, we have been taught to our cost. It remains now to be seen whether we have the needed courage to have that cause entirely removed from the Republic. At any rate, to this grand work of national regeneration and entire purification Congress must now address Itself, with full purpose that the work shall this time be thoroughly done. The deadly upas, root and branch, leaf and fibre, body and sap, must be utterly destroyed. The country is evidently not in a condition to listen patiently to pleas for postponement, however plausible, nor will it permit the responsibility to be shifted to other

shoulders. Authority and power are here commensurate with the duty imposed. There are no cloud-flung shadows to obscure the way. Truth shines with brighter light and intenser heat at every moment, and a country torn and rent and bleeding implores relief from its distress and agony.

If time was at first needed, Congress has now had time. All the requisite materials from which to form an intelligent judgment are now before it. Whether its members look at the origin, the progress, the termination of the war, or at the mockery of a peace now existing, they will find only one unbroken chain of argument in favor of a radical policy of reconstruction. For the omissions of the last session, some excuses may be allowed. A treacherous President stood in the way; and it can be easily seen how reluctant good men might be to admit an apostasy which involved so much of baseness and ingratitude. It was natural that they should seek to save him by bending to him even when he leaned to the side of error. But all is changed now. Congress knows now that it must go on without his aid, and even against his machinations. The advantage of the present session over the last is immense. Where that investigated, this has the facts. Where that walked by faith, this may walk by sight. Where that halted, this must go forward, and where that failed, this must succeed, giving the country whole measures where that gave us half-measures, merely as a means of saving the elections in a few doubtful districts. That Congress saw what was right, but distrusted the enlightenment of the loyal masses; but what was forborne in distrust of the people must now be done with a full knowledge that the people expect and require it. The members go to Washington fresh from the inspiring presence of the people. In every considerable public meeting, and in almost every conceivable way, whether at court-house, school-house, or cross-roads, in doors and out, the subject has been discussed, and the people have emphatically pronounced in favor of a radical policy. Listening to the doctrines of expediency and compromise with pity, impatience, and disgust, they have everywhere broken into demonstrations of the wildest enthusiasm when a brave word has been spoken in favor of equal rights and impartial suffrage. Radicalism, so far from being odious, is not the popular passport to power. The men most bitterly charged with it go to Congress with the largest majorities, while the timid and doubtful are sent by lean majorities, or else left at home. The strange controversy between the President and the Congress, at one time so threatening, is disposed of by the people. The high reconstructive powers which he so confidently, ostentatiously, and haughtily claimed, have been disallowed, denounced, and utterly repudiated; while those claimed by Congress have been confirmed.

Of the spirit and magnitude of the canvass nothing need be said. The appeal was to the people, and the verdict was worthy of the tribunal. Upon an occasion of his own selection, with the advice and approval of his astute Secretary, soon after the members of the Congress had returned to their constituents, the President quitted the executive mansion, sandwiched himself between two recognized heroes,--men whom the whole country delighted to honor,--and, with all the advantage which such company could give him, stumped the country from the Atlantic to the Mississippi, advocating everywhere his policy as against that of Congress. It was a strange sight, and perhaps the most disgraceful exhibition ever made by any President; but, as no evil is entirely unmixed, good has come of this, as from many others. Ambitious, unscrupulous, energetic, indefatigable, voluble, and plausible,--a political gladiator, ready for a "set-to" in any crowd,--he is beaten in his own chosen field, and stands to-day before the country as a convicted usurper, a political criminal, guilty of a bold and persistent attempt to possess himself of the legislative powers solemnly secured to Congress by the Constitution. No vindication could be more complete, no condemnation could be more absolute and humiliating. Unless reopened by the sword, as recklessly threatened in some circles, this question is now closed for all time.

Without attempting to settle here the metaphysical and somewhat theological question (about which so much has already been said and written), whether once in the Union means always in the Union,--agreeably to the formula, Once in grace always in grace,--it is obvious to common sense that the rebellious States stand to-day, in point of law, precisely where they stood when, exhausted, beaten, conquered, they fell powerless at the feet of Federal authority. Their State governments were overthrown, and the lives and property of the leaders of the Rebellion were forfeited. In reconstructing the institutions of these shattered and overthrown States, Congress should begin with a clean slate, and make clean work of it. Let there be no hesitation. It would be a cowardly deference to a defeated and treacherous President, if any account were made of the illegitimate, one-sided, sham governments hurried into existence for a malign purpose in the absence of Congress. These pretended governments, which were never submitted to the people, and from participation in which four millions of the loyal people were excluded by Presidential order, should now be treated according to their true character, as shams and impositions, and supplanted by true and legitimate governments, in the formation of which loyal men, black and white, shall participate.

It is not, however, within the scope of this paper to point out the precise steps to be taken, and the means to be employed. The people are less concerned about these than the grand end to be attained. They demand such a reconstruction as shall put an end to the present anarchical state of things in the late rebellious States,--where frightful murders and wholesale massacres are perpetrated in the very presence of Federal soldiers. This horrible business they require shall cease. They want a reconstruction

such as will protect loyal men, black and white, in their persons and property; such a one as will cause Northern industry, Northern capital, and Northern civilization to flow into the South, and make a man from New England as much at home in Carolina as elsewhere in the Republic. No Chinese wall can now be tolerated. The South must be opened to the light of law and liberty, and this session of Congress is relied upon to accomplish this important work.

The plain, common-sense way of doing this work, as intimated at the beginning, is simply to establish in the South one law, one government, one administration of justice, one condition to the exercise of the elective franchise, for men of all races and colors alike. This great measure is sought as earnestly by loyal white men as by loyal blacks, and is needed alike by both. Let sound political prescience but take the place of an unreasoning prejudice, and this will be done.

Men denounce the negro for his prominence in this discussion; but it is no fault of his that in peace as in war, that in conquering Rebel armies as in reconstructing the rebellious States, the right of the negro is the true solution of our national troubles. The stern logic of events, which goes directly to the point, disdaining all concern for the color or features of men, has determined the interests of the country as identical with and inseparable from those of the negro.

The policy that emancipated and armed the negro--now seen to have been wise and proper by the dullest--was not certainly more sternly demanded than is now the policy of enfranchisement. If with the negro was success in war, and without him failure, so in peace it will be found that the nation must fall or flourish with the negro.

Fortunately, the Constitution of the United States knows no distinction between citizens on account of color. Neither does it know any difference between a citizen of a State and a citizen of the United States. Citizenship evidently includes all the rights of citizens, whether State or national. If the Constitution knows none, it is clearly no part of the duty of a Republican Congress now to institute one. The mistake of the last session was the attempt to do this very thing, by a renunciation of its power to secure political rights to any class of citizens, with the obvious purpose to allow the rebellious States to disfranchise, if they should see fit, their colored citizens. This unfortunate blunder must now be retrieved, and the emasculated citizenship given to the negro supplanted by that contemplated in the Constitution of the United States, which declares that the citizens of each State shall enjoy all the rights and immunities of citizens of the several States,--so that a legal voter in any State shall be a legal voter in all the States.

AN APPEAL TO CONGRESS FOR IMPARTIAL SUFFRAGE by Frederick Douglas

A very limited statement of the argument for impartial suffrage, and for including the negro in the body politic, would require more space than can be reasonably asked here. It is supported by reasons as broad as the nature of man, and as numerous as the wants of society. Man is the only government-making animal in the world. His right to a participation in the production and operation of government is an inference from his nature, as direct and self-evident as is his right to acquire property or education. It is no less a crime against the manhood of a man, to declare that he shall not share in the making and directing of the government under which he lives, than to say that he shall not acquire property and education. The fundamental and unanswerable argument in favor of the enfranchisement of the negro is found in the undisputed fact of his manhood. He is a man, and by every fact and argument by which any man can sustain his right to vote, the negro can sustain his right equally. It is plain that, if the right belongs to any, it belongs to all. The doctrine that some men have no rights that others are bound to respect, is a doctrine which we must banish as we have banished slavery, from which it emanated. If black men have no rights in the eyes of white men, of course the whites can have none in the eyes of the blacks. The result is a war of races, and the annihilation of all proper human relations.

But suffrage for the negro, while easily sustained upon abstract principles, demands consideration upon what are recognized as the urgent necessities of the case. It is a measure of relief,--a shield to break the force of a blow already descending with violence, and render it harmless. The work of destruction has already been set in motion all over the South. Peace to the country has literally meant war to the loyal men of the South, white and black; and negro suffrage is the measure to arrest and put an end to that dreadful strife.

Something then, not by way of argument, (for that has been done by Charles Sumner, Thaddeus Stevens, Wendell Phillips, Gerrit Smith, and other able men,) but rather of statement and appeal.

For better or for worse, (as in some of the old marriage ceremonies,) the negroes are evidently a permanent part of the American population. They are too numerous and useful to be colonized, and too enduring and self-perpetuating to disappear by natural causes. Here they are, four millions of them, and, for weal or for woe, here they must remain. Their history is parallel to that of the country; but while the history of the latter has been cheerful and bright with blessings, theirs has been heavy and dark with agonies

and curses. What O'Connell said of the history of Ireland may with greater truth be said of the negro's. It may be "traced like a wounded man through a crowd, by the blood." Yet the negroes have marvellously survived all the exterminating forces of slavery, and have emerged at the end of two hundred and fifty years of bondage, not morose, misanthropic, and revengeful, but cheerful, hopeful, and forgiving. They now stand before Congress and the country, not complaining of the past, but simply asking for a better future. The spectacle of these dusky millions thus imploring, not demanding, is touching; and if American statesmen could be moved by a simple appeal to the nobler elements of human nature, if they had not fallen, seemingly, into the incurable habit of weighing and measuring every proposition of reform by some standard of profit and loss, doing wrong from choice, and right only from necessity or some urgent demand of human selfishness, it would be enough to plead for the negroes on the score of past services and sufferings. But no such appeal shall be relied on here. Hardships, services, sufferings, and sacrifices are all waived. It is true that they came to the relief of the country at the hour of its extremest need. It is true that, in many of the rebellious States, they were almost the only reliable friends the nation had throughout the whole tremendous war. It is true that, notwithstanding their alleged ignorance, they were wiser than their masters, and knew enough to be loyal, while those masters only knew enough to be rebels and traitors. It is true that they fought side by side in the loyal cause with our gallant and patriotic white soldiers, and that, but for their help,--divided as the loyal States were,--the Rebels might have succeeded in breaking up the Union, thereby entailing border wars and troubles of unknown duration and incalculable calamity. All this and more is true of these loyal negroes. Many daring exploits will be told to their credit. Impartial history will paint them as men who deserved well of their country. It will tell how they forded and swam rivers, with what consummate address they evaded the sharp-eyed Rebel pickets, how they toiled in the darkness of night through the tangled marshes of briers and thorns, barefooted and weary, running the risk of losing their lives, to warn our generals of Rebel schemes to surprise and destroy our loyal army. It will tell how these poor people, whose rights we still despised, behaved to our wounded soldiers, when found cold, hungry, and bleeding on the deserted battle-field; how they assisted our escaping prisoners from Andersonville, Belle Isle, Castle Thunder, and elsewhere, sharing with them their wretched crusts, and otherwise affording them aid and comfort; how they promptly responded to the trumpet call for their services, fighting against a foe that denied them the rights of civilized warfare, and for a government which was without the courage to assert those rights and avenge their violation in their behalf; with what gallantry they flung themselves upon Rebel fortifications, meeting death as fearlessly as any other troops in the service. But upon none of these things is reliance placed. These facts speak to the better dispositions of the human heart; but they seem of little weight with the opponents of impartial suffrage.

It is true that a strong plea for equal suffrage might be addressed to the national sense of honor. Something, too, might be said of national gratitude. A nation might well hesitate before the temptation to betray its allies. There is something immeasurably mean, to say nothing of the cruelty, in placing the loyal negroes of the South under the political power of their Rebel masters. To make peace with our enemies is all well enough; but to prefer our enemies and sacrifice our friends,--to exalt our enemies and cast down our friends,--to clothe our enemies, who sought the destruction of the government, with all political power, and leave our friends powerless in their hands,--is an act which need not be characterized here. We asked the negroes to espouse our cause, to be our friends, to fight for us, and against their masters; and now, after they have done all that we asked them to do,--helped us to conquer their masters, and thereby directed toward themselves the furious hate of the vanquished,--it is proposed in some quarters to turn them over to the political control of the common enemy of the government and of the negro. But of this let nothing be said in this place. Waiving humanity, national honor, the claims of gratitude, the precious satisfaction arising from deeds of charity and justice to the weak and defenceless,--the appeal for impartial suffrage addresses itself with great pertinency to the darkest, coldest, and flintiest side of the human heart, and would wring righteousness from the unfeeling calculations of human selfishness.

For in respect to this grand measure it is the good fortune of the negro that enlightened selfishness, not less than justice, fights on his side. National interest and national duty, if elsewhere separated, are firmly united here. The American people can, perhaps, afford to brave the censure of surrounding nations for the manifest injustice and meanness of excluding its faithful black soldiers from the ballot-box, but it cannot afford to allow the moral and mental energies of rapidly increasing millions to be consigned to hopeless degradation.

Strong as we are, we need the energy that slumbers in the black man's arm to make us stronger. We want no longer any heavy-footed, melancholy service from the negro. We want the cheerful activity of the quickened manhood of these sable millions. Nor can we afford to endure the moral blight which the existence of a degraded and hated class must necessarily inflict upon any people among whom such a class may exist. Exclude the negroes as a class from political rights,--teach them that the high and manly privilege of suffrage is to be enjoyed by white citizens only,--that they may bear the burdens of the state, but that they are to have no part in its direction or its honors,--and you at once deprive them of one of the main incentives to manly character and patriotic devotion to the interests of the government; in a word, you stamp them as a degraded caste,--you teach them to despise

themselves, and all others to despise them. Men are so constituted that they largely derive their ideas of their abilities and their possibilities from the settled judgments of their fellow-men, and especially from such as they read in the institutions under which they live. If these bless them, they are blest indeed; but if these blast them, they are blasted indeed. Give the negro the elective franchise, and you give him at once a powerful motive for all noble exertion, and make him a man among men. A character is demanded of him, and here as elsewhere demand favors supply. It is nothing against this reasoning that all men who vote are not good men or good citizens. It is enough that the possession and exercise of the elective franchise is in itself an appeal to the nobler elements of manhood, and imposes education as essential to the safety of society.

To appreciate the full force of this argument, it must be observed, that disfranchisement in a republican government based upon the idea of human equality and universal suffrage, is a very different thing from disfranchisement in governments based upon the idea of the divine right of kings, or the entire subjugation of the masses. Masses of men can take care of themselves. Besides, the disabilities imposed upon all are necessarily without that bitter and stinging element of invidiousness which attaches to disfranchisement in a republic. What is common to all works no special sense of degradation to any. But in a country like ours, where men of all nations, kindred, and tongues are freely enfranchised, and allowed to vote, to say to the negro, You shall not vote, is to deal his manhood a staggering blow, and to burn into his soul a bitter and goading sense of wrong, or else work in him a stupid indifference to all the elements of a manly character. As a nation, we cannot afford to have amongst us either this indifference and stupidity, or that burning sense of wrong. These sable millions are too powerful to be allowed to remain either indifferent or discontented. Enfranchise them, and they become self-respecting and country-loving citizens. Disfranchise them, and the mark of Cain is set upon them less mercifully than upon the first murderer, for no man was to hurt him. But this mark of inferiority--all the more palpable because of a difference of color--not only dooms the negro to be a vagabond, but makes him the prey of insult and outrage everywhere. While nothing may be urged here as to the past services of the negro, it is quite within the line of this appeal to remind the nation of the possibility that a time may come when the services of the negro may be a second time required. History is said to repeat itself, and, if so, having wanted the negro once, we may want him again. Can that statesmanship be wise which would leave the negro good ground to hesitate, when the exigencies of the country required his prompt assistance? Can that be sound statesmanship which leaves millions of men in gloomy discontent, and possibly in a state of alienation in the day of national trouble? Was not the nation stronger when two hundred thousand sable soldiers were hurled against the Rebel fortifications, than it would have been without them? Arming the negro was an urgent military necessity three years ago,--are we sure that another quite as pressing may not await us? Casting aside all thought of justice and magnanimity, is it wise to impose upon the negro all the burdens involved in sustaining government against foes within and foes without, to make him equal sharer in all sacrifices for the public good, to tax him in peace and conscript him in war, and then coldly exclude him from the ballot-box?

Look across the sea. Is Ireland, in her present condition, fretful, discontented, compelled to support an establishment in which she does not believe, and which the vast majority of her people abhor, a source of power or of weakness to Great Britain? Is not Austria wise in removing all ground of complaint against her on the part of Hungary? And does not the Emperor of Russia act wisely, as well as generously, when he not only breaks up the bondage of the serf, but extends him all the advantages of Russian citizenship? Is the present movement in England in favor of manhood suffrage--for the purpose of bringing four millions of British subjects into full sympathy and co-operation with the British government--a wise and humane movement, or otherwise? Is the existence of a rebellious element in our borders--which New Orleans, Memphis, and Texas show to be only disarmed, but at heart as malignant as ever, only waiting for an opportunity to reassert itself with fire and sword--a reason for leaving four millions of the nation's truest friends with just cause of complaint against the Federal government? If the doctrine that taxation should go hand in hand with representation can be appealed to in behalf of recent traitors and rebels, may it not properly be asserted in behalf of a people who have ever been loyal and faithful to the government? The answers to these questions are too obvious to require statement. Disguise it as we may, we are still a divided nation. The Rebel States have still an anti-national policy. Massachusetts and South Carolina may draw tears from the eyes of our tender-hearted President by walking arm in arm into his Philadelphia Convention, but a citizen of Massachusetts is still an alien in the Palmetto State. There is that, all over the South, which frightens Yankee industry, capital, and skill from its borders. We have crushed the Rebellion, but not its hopes or its malign purposes. The South fought for perfect and permanent control over the Southern laborer. It was a war of the rich against the poor. They who waged it had no objection to the government, while they could use it as a means of confirming their power over the laborer. They fought the government, not because they hated the government as such, but because they found it, as they thought, in the way between them and their one grand purpose of rendering permanent and indestructible their authority and power over the Southern laborer. Though the battle is for the present lost, the hope of gaining this object still exists, and pervades the whole South with a feverish excitement. We have thus far only gained a Union without unity, marriage without love, victory without peace. The hope of gaining

by politics what they lost by the sword, is the secret of all this Southern unrest; and that hope must be extinguished before national ideas and objects can take full possession of the Southern mind. There is but one safe and constitutional way to banish that mischievous hope from the South, and that is by lifting the laborer beyond the unfriendly political designs of his former master. Give the negro the elective franchise, and you at once destroy the purely sectional policy, and wheel the Southern States into line with national interests and national objects. The last and shrewdest turn of Southern politics is a recognition of the necessity of getting into Congress immediately, and at any price. The South will comply with any conditions but suffrage for the negro. It will swallow all the unconstitutional test oaths, repeal all the ordinances of Secession, repudiate the Rebel debt, promise to pay the debt incurred in conquering its people, pass all the constitutional amendments, if only it can have the negro left under its political control. The proposition is as modest as that made on the mountain: "All these things will I give unto thee if thou wilt fall down and worship me."

But why are the Southerners so willing to make these sacrifices? The answer plainly is, they see in this policy the only hope of saving something of their old sectional peculiarities and power. Once firmly seated in Congress, their alliance with Northern Democrats re-established, their States restored to their former position inside the Union, they can easily find means of keeping the Federal government entirely too busy with other important matters to pay much attention to the local affairs of the Southern States. Under the potent shield of State Rights, the game would be in their own hands. Does any sane man doubt for a moment that the men who followed Jefferson Davis through the late terrible Rebellion, often marching barefooted and hungry, naked and penniless, and who now only profess an enforced loyalty, would plunge this country into a foreign war to-day, if they could thereby gain their coveted independence, and their still more coveted mastery over the negroes? Plainly enough, the peace not less than the prosperity of this country is involved in the great measure of impartial suffrage. King Cotton is deposed, but only deposed, and is ready to-day to reassert all his ancient pretensions upon the first favorable opportunity. Foreign countries abound with his agents. They are able, vigilant, devoted. The young men of the South burn with the desire to regain what they call the lost cause; the women are noisily malignant towards the Federal government. In fact, all the elements of treason and rebellion are there under the thinnest disguise which necessity can impose.

What, then, is the work before Congress? It is to save the people of the South from themselves, and the nation from detriment on their account. Congress must supplant the evident sectional tendencies of the South by national dispositions and tendencies. It must cause national ideas and objects to take the lead and control the politics of those States. It must cease to recognize the old slave-masters as the only competent persons to rule the South. In a word, it must enfranchise the negro, and by means of the loyal negroes and the loyal white men of the South build up a national party there, and in time bridge the chasm between North and South, so that our country may have a common liberty and a common civilization. The new wine must be put into new bottles. The lamb may not be trusted with the wolf. Loyalty is hardly safe with traitors.

Statesmen of America! beware what you do. The ploughshare of rebellion has gone through the land beam-deep. The soil is in readiness, and the seed-time has come. Nations, not less than individuals, reap as they sow. The dreadful calamities of the past few years came not by accident, nor unbidden, from the ground. You shudder to-day at the harvest of blood sown in the spring-time of the Republic by your patriot fathers. The principle of slavery, which they tolerated under the erroneous impression that it would soon die out, became at last the dominant principle and power at the South. It early mastered the Constitution, became superior to the Union, and enthroned itself above the law.

Freedom of speech and of the press it slowly but successfully banished from the South, dictated its own code of honor and manners to the nation, brandished the bludgeon and the bowie-knife over Congressional debate, sapped the foundations of loyalty, dried up the springs of patriotism, blotted out the testimonies of the fathers against oppression, padlocked the pulpit, expelled liberty from its literature, invented nonsensical theories about master-races and slave-races of men, and in due season produced a Rebellion fierce, foul, and bloody.

This evil principle again seeks admission into our body politic. It comes now in shape of a denial of political rights to four million loyal colored people. The South does not now ask for slavery. It only asks for a large degraded caste, which shall have no political rights. This ends the case. Statesmen, beware what you do. The destiny of unborn and unnumbered generations is in your hands. Will you repeat the mistake of your fathers, who sinned ignorantly? or will you profit by the blood-bought wisdom all round you, and forever expel every vestige of the old abomination from our national borders? As you members of the Thirty-ninth Congress decide, will the country be peaceful, united, and happy, or troubled, divided, and miserable.

THE NEGRO EXODUS by James B. Runnion

A recent sojourn in the South for a few weeks, chiefly in Louisiana and Mississippi, gave the writer an opportunity to inquire into what has been so aptly called "the negro exodus." The emigration of blacks to Kansas began early in the spring of this year. For a time there was a stampede from two or three of the river parishes in Louisiana and as many counties opposite in Mississippi. Several thousand negroes (certainly not fewer than five thousand, and variously estimated as high as ten thousand) had left their cabins before the rush could be stayed or the excitement lulled. Early in May most of the negroes who had quit work for the purpose of emigrating, but had not succeeded in getting off, were persuaded to return to the plantations, and from that time on there have been only straggling families and groups that have watched for and seized the first opportunity for transportation to the North. There is no doubt, however, that there is still a consuming desire among the negroes of the cotton districts in these two States to seek new homes, and there are the best reasons for believing that the exodus will take a new start next spring, after the gathering and conversion of the growing crop. Hundreds of negroes who returned from the river-banks for lack of transportation, and thousands of others infected with the ruling discontent, are working harder in the fields this summer, and practicing more economy and self-denial than ever before, in order to have the means next winter and spring to pay their way to the "promised land."

"We've been working for fourteen long years," said an intelligent negro, in reply to a question as to the cause of the prevailing discontent, "and we ain't no better off than we was when we commenced." This is the negro version of the trouble, which is elaborated on occasion into a harrowing story of oppression and plunder.

"I tell you it's all owing to the radical politicians at the North," explained a representative of the type known as the Bourbons; "they've had their emissaries down here, and deluded the 'niggers' into a very fever of emigration, with the purpose of reducing our basis of representation in Congress and increasing that of the Northern States."

These are the two extremes of opinion at the South. The first is certainly the more reasonable and truthful, though it implies that all the blame rests upon the whites, which is not the case; the second, preposterous as it will appear to Northern readers, is religiously believed by large numbers of the "unreconciled." Between these two extremes there is an infinite variety of theories, all more or less governed by the political faction to which the various theorizers belong; there are at least a dozen of these factions, such as the Bourbons, the conservatives, the native white republicans, the carpet-bag republicans, the negro republicans, etc. There is a political tinge in almost everything in the extreme Southern States. The fact seems to be that the emigration movement among the blacks was spontaneous to the extent that they were ready and anxious to go. The immediate notion of going may have been inculcated by such circulars, issued by railroads and land companies, as are common enough at emigrant centres in the North and West, and the exaggeration characteristic of such literature may have stimulated the imagination of the negroes far beyond anything they are likely to realize in their new homes. Kansas was naturally the favorite goal of the negro emigre, for it was associated in his mind with the names of Jim Lane and John Brown, which are hallowed to him. The timid learned that they could escape what they have come to regard as a second bondage, and they flocked together to gain the moral support which comes from numbers.

Diligent inquiry among representative men, of all classes and from all parts of Louisiana, who were in attendance at the constitutional convention in New Orleans, and careful observation along the river among the land owners and field hands in both Louisiana and Mississippi, left a vivid impression of some material and political conditions which fully account for the negro exodus. I have dropped the social conditions out of the consideration, because I became convinced that the race troubles at the South can be solved to the satisfaction of both whites and blacks without cultivating any closer social relations than those which now prevail. The material conditions which I have in mind are less familiar than the political conditions; they are mainly the land-tenure and credit systems, and mere modifications (scarcely for the better) of the peculiar plantation system of slavery days.

The cotton lands at the South are owned now, as they were before the war, in large tracts. The land was about all that most of the Southern whites had left to them after the war, and they kept it when they could, at the first, in the hope that it would yield them a living through the labor of the blacks; of late years they have not been able to sell their plantations at any fair price, if they desired to do so. The white men with capital who went to the South from the North after the war seemed to acquire the true Southern ambition to be large land owners and planters; and when the ante-bellum owners lost their plantations the land usually went in bulk to the city factors who had made them advances from year to year, and had taken mortgages on their crops and broad acres. As a consequence, the land has never been distributed among the people who inhabit and cultivate it, and agricultural labor in the Southern States approaches the condition of the factory labor in England and the Eastern States more nearly than it does the farm labor of the North and West. Nearly every agricultural laborer north of Mason and Dixon's line, if not the actual possessor of the land he plows, looks forward to owning a farm some time; at the South such an ambition is rare, and small ownership still more an

exception. The practice of paying day wages was first tried after the war; this practice is still in vogue in the sugar and rice districts, where laborers are paid from fifty to seventy cents per day, with quarters furnished and living guaranteed them at nine or ten cents a day. In sections where the wages system prevails, and where there have been no political disturbances, the negroes seem to be perfectly contented; at all events, the emigration fever has not spread among them. But it was found impracticable to maintain the wage system in the cotton districts. The negroes themselves fought against it, because it reminded them too much of the slave-gang, driven out at daybreak and home at sundown. In many cases the planters were forced to abandon it, because they had not the means to carry on such huge farming, and they could not secure the same liberal advances from capitalists as when they were able to mortgage a growing "crop of niggers." Then the system of working on shares was tried. This was reasonably fair, and the negro laborers were satisfied as long as it lasted. The owners of the land, under this system, would furnish the indispensable mule and the farming implements, and take one half the product. The planters themselves relinquished this system. Some of them contend that the laziness and indifference of the negro made the partnership undesirable; many others admit that they were not able to advance the negro tenant his supplies pending the growth of the year's crop, as it was necessary they should do under the sharing system. Now the renting system is almost universal. It yields the land owner a certainty, endangered only by the death, sickness, or desertion of the negro tenant; but it throws the latter upon his own responsibility, and frequently makes him the victim of his own ignorance and the rapacity of the white man. The rent of land, on a money basis, varies from six to ten dollars an acre per year, while the same land can be bought in large quantities all the way from fifteen to thirty dollars per acre, according to location, clearing, improvement, richness, etc. When paid in product, the rent varies from eighty to one hundred pounds of lint cotton per acre for land that produces from two hundred to four hundred pounds of cotton per acre; the tenant undertakes to pay from one quarter to one half--perhaps an average of one third--of his crop for the use of the land, without stock, tools, or assistance of any kind. The land owners usually claim that they make no money even at these exorbitant figures. If they do not, it is because only a portion of their vast possessions is under cultivation, because they do no work themselves, and in some cases because the negroes do not cultivate and gather as large a crop as they could and ought to harvest. It is very certain that the negro tenants, as a class, make no money; if they are out of debt at the end of a season, they have reason to rejoice.

The credit system, which is as universal as the renting system, is even more illogical and oppressive. The utter viciousness of both systems in their mutual dependence is sufficiently illustrated by the single fact that, after fourteen years of freedom and labor on their own account, the great mass of the negroes depend for their living on an advance of supplies (as they need food, clothing, or tools during the year) upon the pledge of their growing crop. This is a generic imitation of the white man's improvidence during the slavery times; then the planters mortgaged their crops and negroes, and where one used the advances to extend his plantation, ten squandered the money. The negro's necessities have developed an offensive race, called merchants by courtesy, who keep supply stores at the cross-roads and steamboat landings, and live upon extortion. These people would be called sharks, harpies, and vampires in any Northwestern agricultural community, and they would not survive more than one season. The country merchant advances the negro tenant such supplies as the negro wants up to a certain amount, previously fixed by contract, and charges the negro at least double the value of every article sold to him. There is no concealment about the extortion; every store-keeper has his cash price and his credit price, and in nearly all cases the latter is one hundred per cent. higher than the former. The extortion is justified by those who practice it on the ground that their losses by bad debts, though their advances are always secured by mortgage on the growing crop, overbalance the profits; this assertion is scarcely borne out by the comparative opulence of the "merchant" and the pitiful poverty of the laborer. Some of the largest and wealthiest planters have sought to protect their tenants from the merciless clutches of the contrary merchant, who is more frequently than not an Israelite, by advancing supplies of necessary articles at reasonable prices. But the necessities of the planter, if not his greed, often betray him into plundering the negro. The planter himself is generally a victim to usury. He still draws on the city factor to the extent of ten dollars a bale upon his estimated crop. He pays this factor two and one half per cent. commission for the advance, eight per cent. interest for the money, two and one half per cent. more for disposing of the crop when consigned to him, and sometimes still another commission for the purchase of the supplies. The planter who furnishes his tenants with supplies on credit is usually paying an interest of fifteen to eighteen per cent. himself, and necessarily takes some risk in advancing upon an uncertain crop and to a laborer whom he believes to be neither scrupulous nor industrious; these conditions necessitate more than the ordinary profit, and in many cases suggest exorbitant and unreasonable charges. But whether the negro deals with the merchant or the land owner, his extravagance almost invariably exhausts his credit, even if it be large. The negro is a sensuous creature, and luxurious in his way. The male is an enormous consumer of tobacco and whisky; the female has an inordinate love for flummery; both are fond of sardines, potted meats, and canned goods generally, and they indulge themselves without any other restraint than the refusal of their merchant to sell to them. The man who advances supplies watches his negro customers constantly; if they are working well and their crop promises to be large, he will permit and even encourage them to draw upon him liberally; it is only a partial failure of the crop, or

some intimation of the negro's intention to shirk his obligations, that induces his country factor to preach the virtue of self-restraint, or moralize upon the advantages of economy.

The land owner's rent and the merchant's advances are both secured by a chattel mortgage on the tenant's personal property, and by a pledge of the growing crop. The hired laborer (for it is common for negroes to work for wages for other negroes who rent lands) has also a lien upon the growing crops second only to the land owner's; but as the law requires that the liens shall be recorded, which the ignorant laborer usually neglects and the shrewd merchant never fails to do, the former is generally cheated of his security. Among those who usually work for hire are the women, who are expert cotton pickers, and the loss of wages which so many of them have suffered by reason of the prior lien gained by landlord and merchant has helped to make them earnest and effective advocates of emigration. The Western farmer considers it hard enough to struggle under one mortgage at a reasonable interest; the negro tenant begins his season with three mortgages, covering all he owns, his labor for the coming year, and all he expects to acquire during that period. He pays one third his product for the use of the land; he pays double the value of all he consumes; he pays an exorbitant fee for recording the contract by which he pledges his pound of flesh; he is charged two or three times as much as he ought to pay for ginning his cotton; and, finally, he turns over his crop to be eaten up in commissions, if anything still be left to him. It is easy to understand why the negro rarely gets ahead in the world. This mortgaging of future services, which is practically what a pledge of the growing crop amounts to, is in the nature of bondage. It has a tendency to make the negro extravagant, reckless, and unscrupulous; he has become convinced from previous experience that nothing will be coming to him on the day of settlement, and he is frequently actuated by the purpose of getting as much as possible and working as little as possible. Cases are numerous in which the negro abandons his own crop at picking time, because he knows that he has already eaten up its full value; and so he goes to picking for wages on some other plantation. In other cases, where negroes have acquired mules and farming implements upon which a merchant has secured a mortgage in the manner described, they are practically bound to that merchant from year to year, in order to retain their property; if he removes from one section to another, they must follow him, and rent and cultivate lands in his neighborhood. It is only the ignorance, the improvidence, and the happy disposition of the negro, under the influence of the lazy, drowsy climate, to which he is so well adapted physically, that have enabled him to endure these hardships so long. And, though the negro is the loser, the white man is not often the gainer, from this false plantation and mercantile system. The incidental risk may not be so large as the planter and merchant pretend, but the condition of the people is an evidence that the extortion they practice yields no better profit in the long run than would be gained by competition in fair prices on a cash system; and in leading up to a general emigration of the laboring population the abuses described will eventually ruin and impoverish those who have heretofore been the only beneficiaries thereof. The decay of improvements inevitable under annual rentings, the lack of sufficient labor to cultivate all the good land, and the universal idleness of the rural whites have kept the land owners comparatively poor; the partial failure of crops and the unscrupulousness of the negro debtor, engendered by the infamous exactions of his creditor, have prevented the merchants, as a class, from prospering as much as might be supposed; and, finally, the uniform injustice to the laborers induces them to fly to ills they know not of, rather than bear those they have. It is a blessing to the negro that the laws do not yet provide for a detention of the person in the case of debt, or escape would be shut off entirely; as it is, various influences and circumstances appertaining to the system in vogue have been used to prevent the easy flight of those who desire to go, and have detained thousands of blacks for a time who are fretting to quit the country.

Political oppression has contributed largely to the discontent which is the prime cause of the exodus. "Bulldozing" is the term by which all forms of this oppression are known. The native whites are generally indisposed to confess that the negroes are quitting the country on account of political injustice and persecution; even those who freely admit and fitly characterize the abuses already described seek to deny, or at least belittle, the political abuses. The fact that a large number of negroes have emigrated from Madison Parish, Louisiana, where there has never been any bulldozing, and where the negroes are in full and undisputed political control, is cited as proof that political disturbances cut no figure in the case. But the town of Delta, in Madison Parish, is at once on the river and the terminus of a railroad that runs back through the interior of the State; thus Madison Parish would furnish the natural exit for the fugitives from the adjoining counties, where there have been political disturbances. It would be just as reasonable to contend that the plundering of the negroes has had no influence in driving them away, since many of those who have emigrated were among the most prosperous of the blacks, as to deny the agency of political persecution. Families that had been able to accumulate a certain amount of personal property, in spite of the extortionate practices, sold their mules, their implements, their cows, their pigs, their sheep, and their household goods for anything they would bring,--frequently as low as one sixth of their value,--in order that they might improve an immediate opportunity to go away; it is evident that there must have been some cause outside of extortion in their case. There are candid native whites who do not deny, but justify, the violent methods which have been

employed to disfranchise the negroes, or compel them to vote under white dictation, in many parts of Louisiana and Mississippi, on the ground that the men who pay the taxes should vote them and control the disbursement of the public moneys. The gentlemen who advance this argument seem to ignore the fact that the very Northerner whom they are seeking to convert to "the Mississippi plan" may himself be a taxpayer in some Northern city, where public affairs are controlled by a class of voters in every way as ignorant and irresponsible as the blacks, but where bulldozing has never yet been suggested as a remedy. For the rest, the evidences of political oppression are abundant and convincing. The bulldozers as a class are more impecunious and irresponsible than the negroes, and, unlike the negroes, they will not work. There has been more of the "night-riding," the whippings, the mysterious disappearances, the hangings, and the terrorism comprehended in the term bulldozing than has been reported by those "abstracts and brief chronicles of the time," the Southern newspapers, which are now all of one party, and defer to the ruling sentiment among the whites. The exodus has wrung from two or three of the more candid and independent journals, however, a virtual confession of the fiendish practices of bulldozing in their insistance that these practices must be abandoned. The non-resident land owners and the resident planters, the city factors and the country merchants of means and respectability, have taken no personal part in the terrorizing of the negro, but they have tolerated it, and sometimes encouraged it, in order to gratify their preference for "white government." The negroes have suffered the more because they have not resisted and defended themselves; now they have begun to convince those who have persecuted them that, if they will not strike back, they can and will run away. No one who is at all familiar with the freedman can doubt that the abridgment of his political rights has been one of the main causes of the exodus. Voting is widely regarded at the North as a disagreeable duty, but the negro looks upon it as the highest privilege in life; to be frightened out of the exercise of this privilege, or compelled to exercise it in conflict with his convictions and preferences, is to suffer from a cruel injustice, which the negro will now try to escape, since he has learned that escape is possible. The women, though free from personal assaults, suffer from the terrorism that prevails in certain districts as much as the men. "We might as well starve or freeze to death in Kansas," they say, "as to be shot-gunned here." If they talk to you in confidence, they declare that the ruling purpose is to escape from the "slaughter-pens" of the South. Political persecution, and not the extortion they suffer, is the refrain of all the speakers at negro meetings that are held in encouragement and aid of the emigration. It is idle to deny that the varied injustice which the negroes have suffered as voters is accountable for a large part of their universal yearning for new homes, and it will be folly for the responsible classes at the South to ignore this fact.

As it is the negroes who are fleeing from the South, it is natural to look among the dominant class for the injustice which is driving them away; but it would be unfair to conclude that the blame rests entirely upon the whites, and still more so to leave the impression that there is no extenuation for the mistakes and abuses for which the whites are responsible. Much of the intimidation of the blacks has been tolerated, if not suggested, by a fear of negro uprisings. The apprehension is a legacy from the days of slavery, and is more unreasonable now than it was then; but still it exists. This is not an excuse, but an explanation. The Pharaohs of the time of Moses were in constant dread lest the Hebrews under their rule should go over to their enemies, and their dread doubtless increased the cruelty of the Egyptians; but, while this dread was an extenuation in the eyes of the persecutors, it did not prevent the Hebrews from fleeing the persecution. So the blacks are going without regard to the justification which the whites may set up for their treatment; the only difference between the old and new exodus is that, as the writer heard one negro speaker express it, "every black man is his own Moses in this exodus." The negro may be lazy; it seems impossible to be otherwise in the Southern climate. He may not be willing to work on Saturdays, no matter how urgent the necessity; the indulgence in holidays is said to be one of the chief drawbacks to the advancement of the emancipated serfs of Russia. The blacks are certainly extravagant in their way, though the word seems to be almost misused in connection with a race who live largely on pork and molasses, and rarely wear more than half a dollar's worth of clothes at one time. They have not the instinct of home as it prevails among the whites, but incline to a crude and unsystematic communism; the negro quarters of the old plantations are all huddled together in the centre, and, except where the land owners have interfered to encourage a different life, there is still too much promiscuousness in the relation of the sexes. The negro, as a rule, has no ambition to become a land owner; he prefers to invest his surplus money, when he has any, in personal and movable property. In most cases where the blacks have been given the opportunity of buying land on long time, and paying yearly installments out of the proceeds of their annual crops, they have tired of the bargain after a year or two, and abandoned the contract. The negro politicians and preachers are not all that reformers and moralists would have them; the imitative faculty of the African has betrayed the black politician into many of the vicious ways of the white politician, and the colored preacher is frequently not above "the pomps and vanity of this wicked world." All this is the more unfortunate, as the blacks have a child-like confidence in their chosen leaders, founded partly on their primitive character, and partly on their distrust of the native whites. Both their politicians and their preachers have given abundant evidence of their insincerity during the excitement of emigration by blowing hot and blowing cold; by talking to the negroes one way, and to the whites another; and even to the extent, in some instances, of taking money to use their influence for discouraging and impeding emigration. These are some of the faults

and misfortunes on the part of the blacks which enter into the race troubles. The chief blame which attaches to the whites is the failure to make a persistent effort, by education and kind treatment, to overcome the distrust and cure the faults of the negroes. The whites control, because they constitute the "property and intelligence" of the South, to use the words of a democratic statesman; this power should have been used to gain the confidence of the blacks. Had such a course been taken, there would not have been the fear of reenslavement, which actually prevails to a considerable extent among the negroes. So long as a portion of the whites entertain the conviction that the war of the sections will be renewed within a few years, as is the case, the negroes will suspect and dread the class who would treat them as enemies in case the war should come, and will seek to escape to a section of the country where they would not be so treated. Perhaps, too, there would have been a voluntary political division among the black voters, had the whites used more pacific means to bring it about, and had they themselves set the example. And last, but not least, in making up the sum of blame that the whites must bear, is their own unwillingness to labor, which gives the rural population too much time for mischief and too little sympathy with the working classes.

As we have traced the causes that have led to the exodus, and described the conditions which warrant the belief that there will be a renewal of the emigration on a more extended scale next spring, and endeavored to distribute the responsibility for the troubles equitably among whites and blacks, remedies have naturally suggested themselves to the reader; in fact, they are more easily to be thought out than accomplished. A few general reflections may be added, however, in order to indicate the probable solution of the race troubles that have brought about the exodus, if, indeed, the whites and blacks of the South are ever going to live together in peace.

(1.) It is certain that negro labor is the best the South can have, and equally certain that the climate and natural conditions of the South are better suited to the negro than any others on this continent. The alluvial lands, which many persons believe the negroes alone can cultivate, on account of climatic conditions, are so rich that it might literally be said it is only necessary to tickle them with a hoe to make them laugh back a harvest. The common prosperity of the country--the agricultural interests of the South and the commercial interests of the North--will be best served, therefore, by the continued residence and labor of the blacks in the cotton States.

(2.) The fact stated in the foregoing paragraph is so well understood at the North that the Southern people should dismiss the idea that there is any scheming among the Northern people, political or otherwise, to draw the black labor away from its natural home. The same fact should also influence the people at the North not to be misled by any professional philanthropists who may have some self-interest in soliciting aid to facilitate negro emigration from the South. The duty of the North in this matter is simply to extend protection and assure safe-conduct to the negroes, if the Southern whites attempt to impede voluntary emigration by either law or violence. Any other course might be cruel to the negro in encouraging him to enter on a new life in a strange climate, as well as an injustice to the white land owners of the South.

(3.) There is danger that the Southern whites will, as a rule, misinterpret the meaning of the exodus. Many are inclined to underrate its importance, and those who appreciate its significance are apt to look for temporary and superficial remedies. The vague promises made at the Vicksburg convention, which was controlled by the whites, and called to consider the emigration movement, have had no influence with the negroes, because they have heard such promises before. Had the convention adopted some definite plan of action, such as ex-Governor Foote, of Mississippi, submitted, its session might not have been in vain. This plan was to establish a committee in every county, composed of men who have the confidence of both whites and blacks, that should be auxiliary to the public authorities, listen to complaints, and arbitrate, advise, conciliate, or prosecute, as each case should demand. It is short-sighted for the Southern people to make mere temporary concessions, such as have been made in some cases this year, for that course would establish an annual strike. It is folly for them to suppose they can stem the tide of emigration by influencing the regular lines of steamboats not to carry the refugees, for the people of the North will see that the blacks shall not be detained in the South against their will. It is unwise for them to devise schemes for importing Chinese, or encouraging the immigration of white labor as a substitute for negro labor, when they may much better bestir themselves to make the present effective labor content.

(4.) Education will be the most useful agent to employ in the permanent harmonizing of the two races, and the redemption of both from the faults and follies which constitute their troubles. It is not the education of the negro alone, whose ambition for learning is increasing notably with every new generation, but the education of the mass of the young whites, that is needed to inculcate more tolerance of color and opinion, to give them an aspiration beyond that of riding a horse and hanging a "nigger," and to enable them to set a better example to the imitative blacks in the way of work and frugality. The blacks need the education to protect them from designing white men; the whites need it to teach them that their own interests will be best served by abandoning bulldozing of all kinds.

(5.) Reform in the land tenure, by converting the plantation monopolies into small holdings; abolition of the credit system, by abandoning the laws which sustain it; a diversification of crops; and attention to new manufacturing, maritime, and commercial enterprises,--these are the material changes that are most needed. They can be secured only through the active and earnest efforts of the whites. The blacks will be found responsive.

(6.) The hope of the negro exodus at its present stage, or even if it shall continue another season, is that the actual loss of the valuable labor that has gone, and the prospective loss of more labor that is anxious to go, will induce the intelligent and responsible classes at the South to overcome their own prejudices, and to compel the extremists, irreconcilables, and politicians generally, of all parties, to abandon agitation, and give the South equal peace and equal chance for black and white.

MY ESCAPE FROM SLAVERY by Frederick Douglass

In the first narrative of my experience in slavery, written nearly forty years ago, and in various writings since, I have given the public what I considered very good reasons for withholding the manner of my escape. In substance these reasons were, first, that such publication at any time during the existence of slavery might be used by the master against the slave, and prevent the future escape of any who might adopt the same means that I did. The second reason was, if possible, still more binding to silence: the publication of details would certainly have put in peril the persons and property of those who assisted. Murder itself was not more sternly and certainly punished in the State of Maryland than that of aiding and abetting the escape of a slave. Many colored men, for no other crime than that of giving aid to a fugitive slave, have, like Charles T. Torrey, perished in prison. The abolition of slavery in my native State and throughout the country, and the lapse of time, render the caution hitherto observed no longer necessary. But even since the abolition of slavery, I have sometimes thought it well enough to baffle curiosity by saying that while slavery existed there were good reasons for not telling the manner of my escape, and since slavery had ceased to exist, there was no reason for telling it. I shall now, however, cease to avail myself of this formula, and, as far as I can, endeavor to satisfy this very natural curiosity. I should, perhaps, have yielded to that feeling sooner, had there been anything very heroic or thrilling in the incidents connected with my escape, for I am sorry to say I have nothing of that sort to tell; and yet the courage that could risk betrayal and the bravery which was ready to encounter death, if need be, in pursuit of freedom, were essential features in the undertaking. My success was due to address rather than courage, to good luck rather than bravery. My means of escape were provided for me by the very men who were making laws to hold and bind me more securely in slavery.

It was the custom in the State of Maryland to require the free colored people to have what were called free papers. These instruments they were required to renew very often, and by charging a fee for this writing, considerable sums from time to time were collected by the State. In these papers the name, age, color, height, and form of the freeman were described, together with any scars or other marks upon his person which could assist in his identification. This device in some measure defeated itself--since more than one man could be found to answer the same general description. Hence many slaves could escape by personating the owner of one set of papers; and this was often done as follows: A slave, nearly or sufficiently answering the description set forth in the papers, would borrow or hire them till by means of them he could escape to a free State, and then, by mail or otherwise, would return them to the owner. The operation was a hazardous one for the lender as well as for the borrower. A failure on the part of the fugitive to send back the papers would imperil his benefactor, and the discovery of the papers in possession of the wrong man would imperil both the fugitive and his friend. It was, therefore, an act of supreme trust on the part of a freeman of color thus to put in jeopardy his own liberty that another might be free. It was, however, not unfrequently bravely done, and was seldom discovered. I was not so fortunate as to resemble any of my free acquaintances sufficiently to answer the description of their papers. But I had a friend--a sailor--who owned a sailor's protection, which answered somewhat the purpose of free papers--describing his person, and certifying to the fact that he was a free American sailor. The instrument had at its head the American eagle, which gave it the appearance at once of an authorized document. This protection, when in my hands, did not describe its bearer very accurately. Indeed, it called for a man much darker than myself, and close examination of it would have caused my arrest at the start.

In order to avoid this fatal scrutiny on the part of railroad officials, I arranged with Isaac Rolls, a Baltimore hackman, to bring my baggage to the Philadelphia train just on the moment of starting, and jumped upon the car myself when the train was in motion. Had I gone into the station and offered to purchase a ticket, I should have been instantly and carefully examined, and undoubtedly arrested. In choosing this plan I considered the jostle of the train, and the natural haste of the conductor, in a train crowded with passengers, and relied upon my skill and address in playing the sailor, as described in my protection, to do the rest. One element in my favor was the kind feeling which prevailed in Baltimore and other sea-ports at the time, toward "those who go down to the sea in

ships." "Free trade and sailors' rights" just then expressed the sentiment of the country. In my clothing I was rigged out in sailor style. I had on a red shirt and a tarpaulin hat, and a black cravat tied in sailor fashion carelessly and loosely about my neck. My knowledge of ships and sailor's talk came much to my assistance, for I knew a ship from stem to stern, and from keelson to cross-trees, and could talk sailor like an "old salt." I was well on the way to Havre de Grace before the conductor came into the negro car to collect tickets and examine the papers of his black passengers. This was a critical moment in the drama. My whole future depended upon the decision of this conductor. Agitated though I was while this ceremony was proceeding, still, externally, at least, I was apparently calm and self-possessed. He went on with his duty--examining several colored passengers before reaching me. He was somewhat harsh in tome and peremptory in manner until he reached me, when, strange enough, and to my surprise and relief, his whole manner changed. Seeing that I did not readily produce my free papers, as the other colored persons in the car had done, he said to me, in friendly contrast with his bearing toward the others:

"I suppose you have your free papers?"

To which I answered:

"No sir; I never carry my free papers to sea with me."

"But you have something to show that you are a freeman, haven't you?"

"Yes, sir," I answered; "I have a paper with the American Eagle on it, and that will carry me around the world."

With this I drew from my deep sailor's pocket my seaman's protection, as before described. The merest glance at the paper satisfied him, and he took my fare and went on about his business. This moment of time was one of the most anxious I ever experienced. Had the conductor looked closely at the paper, he could not have failed to discover that it called for a very different-looking person from myself, and in that case it would have been his duty to arrest me on the instant, and send me back to Baltimore from the first station. When he left me with the assurance that I was all right, though much relieved, I realized that I was still in great danger: I was still in Maryland, and subject to arrest at any moment. I saw on the train several persons who would have known me in any other clothes, and I feared they might recognize me, even in my sailor "rig," and report me to the conductor, who would then subject me to a closer examination, which I knew well would be fatal to me.

Though I was not a murderer fleeing from justice, I felt perhaps quite as miserable as such a criminal. The train was moving at a very high rate of speed for that epoch of railroad travel, but to my anxious mind it was moving far too slowly. Minutes were hours, and hours were days during this part of my flight. After Maryland, I was to pass through Delaware--another slave State, where slave-catchers generally awaited their prey, for it was not in the interior of the State, but on its borders, that these human hounds were most vigilant and active. The border lines between slavery and freedom were the dangerous ones for the fugitives. The heart of no fox or deer, with hungry hounds on his trail in full chase, could have beaten more anxiously or noisily than did mine from the time I left Baltimore till I reached Philadelphia. The passage of the Susquehanna River at Havre de Grace was at that time made by ferry-boat, on board of which I met a young colored man by the name of Nichols, who came very near betraying me. He was a "hand" on the boat, but, instead of minding his business, he insisted upon knowing me, and asking me dangerous questions as to where I was going, when I was coming back, etc. I got away from my old and inconvenient acquaintance as soon as I could decently do so, and went to another part of the boat. Once across the river, I encountered a new danger. Only a few days before, I had been at work on a revenue cutter, in Mr. Price's ship-yard in Baltimore, under the care of Captain McGowan. On the meeting at this point of the two trains, the one going south stopped on the track just opposite to the one going north, and it so happened that this Captain McGowan sat at a window where he could see me very distinctly, and would certainly have recognized me had he looked at me but for a second. Fortunately, in the hurry of the moment, he did not see me; and the trains soon passed each other on their respective ways. But this was not my only hair-breadth escape. A German blacksmith whom I knew well was on the train with me, and looked at me very intently, as if he thought he had seen me somewhere before in his travels. I really believe he knew me, but had no heart to betray me. At any rate, he saw me escaping and held his peace.

The last point of imminent danger, and the one I dreaded most, was Wilmington. Here we left the train and took the steam-boat for Philadelphia. In making the change here I again apprehended arrest, but no one disturbed me, and I was soon on the broad and beautiful Delaware, speeding away to the Quaker City. On reaching Philadelphia in the afternoon, I inquired of a colored man how I could get on to New York. He directed me to the William-street depot, and thither I went, taking the train that night. I reached New York Tuesday morning, having completed the journey in less than twenty-four hours.

My free life began on the third of September, 1838. On the morning of the fourth of that month, after an anxious and most perilous but safe journey, I found myself in the big city of New York, a FREE MAN--one more added to the mighty throng which, like the confused waves of the troubled sea, surged to and fro between the lofty walls of Broadway. Though dazzled with the wonders which met me on every hand, my thoughts could not be much withdrawn from my strange situation. For the moment, the dreams of my youth and the hopes of my manhood were completely fulfilled. The bonds that had held me to "old master" were broken. No man now had a right to call me his slave or assert mastery over me. I was in the rough and tumble of an outdoor world, to take my chance with the rest of its busy number. I have often been asked how I felt when first I found myself on free soil. There is scarcely anything in my experience about which I could not give a more satisfactory answer. A new world had opened upon me. If life is more than breath and the "quick round of blood," I lived more in that one day than in a year of my slave life. It was a time of joyous excitement which words can but tamely describe. In a letter written to a friend soon after reaching New York, I said: "I felt as one might feel upon escape from a den of hungry lions." Anguish and grief, like darkness and rain, may be depicted; but gladness and joy, like the rainbow, defy the skill of pen or pencil. During ten or fifteen years I had been, as it were, dragging a heavy chain which no strength of mine could break; I was not only a slave, but a slave for life. I might become a husband, a father, an aged man, but through all, from birth to death, from the cradle to the grave, I had felt myself doomed. All efforts I had previously made to secure my freedom had not only failed, but had seemed only to rivet my fetters the more firmly, and to render my escape more difficult. Baffled, entangled, and discouraged, I had at times asked myself the question, May not my condition after all be God's work, and ordered for a wise purpose, and if so, Is not submission my duty? A contest had in fact been going on in my mind for a long time, between the clear consciousness of right and the plausible make-shifts of theology and superstition. The one held me an abject slave--a prisoner for life, punished for some transgression in which I had no lot nor part; and the other counseled me to manly endeavor to secure my freedom. This contest was now ended; my chains were broken, and the victory brought me unspeakable joy.

But my gladness was short-lived, for I was not yet out of the reach and power of the slave-holders. I soon found that New York was not quite so free or so safe a refuge as I had supposed, and a sense of loneliness and insecurity again oppressed me most sadly. I chanced to meet on the street, a few hours after my landing, a fugitive slave whom I had once known well in slavery. The information received from him alarmed me. The fugitive in question was known in Baltimore as "Allender's Jake," but in New York he wore the more respectable name of "William Dixon." Jake, in law, was the property of Doctor Allender, and Tolly Allender, the son of the doctor, had once made an effort to recapture MR. DIXON, but had failed for want of evidence to support his claim. Jake told me the circumstances of this attempt, and how narrowly he escaped being sent back to slavery and torture. He told me that New York was then full of Southerners returning from the Northern watering-places; that the colored people of New York were not to be trusted; that there were hired men of my own color who would betray me for a few dollars; that there were hired men ever on the lookout for fugitives; that I must trust no man with my secret; that I must not think of going either upon the wharves or into any colored boarding-house, for all such places were closely watched; that he was himself unable to help me; and, in fact, he seemed while speaking to me to fear lest I myself might be a spy and a betrayer. Under this apprehension, as I suppose, he showed signs of wishing to be rid of me, and with whitewash brush in hand, in search of work, he soon disappeared.

This picture, given by poor "Jake," of New York, was a damper to my enthusiasm. My little store of money would soon be exhausted, and since it would be unsafe for me to go on the wharves for work, and I had no introductions elsewhere, the prospect for me was far from cheerful. I saw the wisdom of keeping away from the ship-yards, for, if pursued, as I felt certain I should be, Mr. Auld, my "master," would naturally seek me there among the calkers. Every door seemed closed against me. I was in the midst of an ocean of my fellow-men, and yet a perfect stranger to every one. I was without home, without acquaintance, without money, without credit, without work, and without any definite knowledge as to what course to take, or where to look for succor. In such an extremity, a man had something besides his new-born freedom to think of. While wandering about the streets of New York, and lodging at least one night among the barrels on one of the wharves, I was indeed free--from slavery, but free from food and shelter as well. I kept my secret to myself as long as I could, but I was compelled at last to seek some one who would befriend me without taking advantage of my destitution to betray me. Such a person I found in a sailor named Stuart, a warm-hearted and generous fellow, who, from his humble home on Centre street, saw me standing on the opposite sidewalk, near the Tombs prison. As he approached me, I ventured a remark to him which at once enlisted his interest in me. He took me to his home to spend the night, and in the morning went with me to Mr. David Ruggles, the secretary of the New York Vigilance Committee, a co-worker with Isaac T. Hopper, Lewis and Arthur Tappan, Theodore S. Wright, Samuel Cornish, Thomas Downing, Philip A. Bell, and other true men of their time. All these (save Mr. Bell, who still lives, and is editor and publisher of a paper called the "Elevator," in San Francisco) have finished their work on earth. Once in the hands of these brave and wise men, I felt comparatively safe. With Mr. Ruggles, on

the corner of Lispenard and Church streets, I was hidden several days, during which time my intended wife came on from Baltimore at my call, to share the burdens of life with me. She was a free woman, and came at once on getting the good news of my safety. We were married by Rev. J. W. C. Pennington, then a well-known and respected Presbyterian minister. I had no money with which to pay the marriage fee, but he seemed well pleased with our thanks.

Mr. Ruggles was the first officer on the "Underground Railroad" whom I met after coming North, and was, indeed, the only one with whom I had anything to do till I became such an officer myself. Learning that my trade was that of a calker, he promptly decided that the best place for me was in New Bedford, Mass. He told me that many ships for whaling voyages were fitted out there, and that I might there find work at my trade and make a good living. So, on the day of the marriage ceremony, we took our little luggage to the steamer JOHN W. RICHMOND, which, at that time, was one of the line running between New York and Newport, R. I. Forty-three years ago colored travelers were not permitted in the cabin, nor allowed abaft the paddle-wheels of a steam vessel. They were compelled, whatever the weather might be,--whether cold or hot, wet or dry,--to spend the night on deck. Unjust as this regulation was, it did not trouble us much; we had fared much harder before. We arrived at Newport the next morning, and soon after an old fashioned stage-coach, with "New Bedford" in large yellow letters on its sides, came down to the wharf. I had not money enough to pay our fare, and stood hesitating what to do. Fortunately for us, there were two Quaker gentlemen who were about to take passage on the stage,--Friends William C. Taber and Joseph Ricketson,--who at once discerned our true situation, and, in a peculiarly quiet way, addressing me, Mr. Taber said: "Thee get in." I never obeyed an order with more alacrity, and we were soon on our way to our new home. When we reached "Stone Bridge" the passengers alighted for breakfast, and paid their fares to the driver. We took no breakfast, and, when asked for our fares, I told the driver I would make it right with him when we reached New Bedford. I expected some objection to this on his part, but he made none. When, however, we reached New Bedford, he took our baggage, including three music-books,--two of them collections by Dyer, and one by Shaw,--and held them until I was able to redeem them by paying to him the amount due for our rides. This was soon done, for Mr. Nathan Johnson not only received me kindly and hospitably, but, on being informed about our baggage, at once loaned me the two dollars with which to square accounts with the stage-driver. Mr. and Mrs. Nathan Johnson reached a good old age, and now rest from their labors. I am under many grateful obligations to them. They not only "took me in when a stranger" and "fed me when hungry," but taught me how to make an honest living. Thus, in a fortnight after my flight from Maryland, I was safe in New Bedford, a citizen of the grand old commonwealth of Massachusetts.

Once initiated into my new life of freedom and assured by Mr. Johnson that I need not fear recapture in that city, a comparatively unimportant question arose as to the name by which I should be known thereafter in my new relation as a free man. The name given me by my dear mother was no less pretentious and long than Frederick Augustus Washington Bailey. I had, however, while living in Maryland, dispensed with the Augustus Washington, and retained only Frederick Bailey. Between Baltimore and New Bedford, the better to conceal myself from the slave-hunters, I had parted with Bailey and called myself Johnson; but in New Bedford I found that the Johnson family was already so numerous as to cause some confusion in distinguishing them, hence a change in this name seemed desirable. Nathan Johnson, mine host, placed great emphasis upon this necessity, and wished me to allow him to select a name for me. I consented, and he called me by my present name--the one by which I have been known for three and forty years--Frederick Douglass. Mr. Johnson had just been reading the "Lady of the Lake," and so pleased was he with its great character that he wished me to bear his name. Since reading that charming poem myself, I have often thought that, considering the noble hospitality and manly character of Nathan Johnson--black man though he was--he, far more than I, illustrated the virtues of the Douglas of Scotland. Sure am I that, if any slave-catcher had entered his domicile with a view to my recapture, Johnson would have shown himself like him of the "stalwart hand."

The reader may be surprised at the impressions I had in some way conceived of the social and material condition of the people at the North. I had no proper idea of the wealth, refinement, enterprise, and high civilization of this section of the country. My "Columbian Orator," almost my only book, had done nothing to enlighten me concerning Northern society. I had been taught that slavery was the bottom fact of all wealth. With this foundation idea, I came naturally to the conclusion that poverty must be the general condition of the people of the free States. In the country from which I came, a white man holding no slaves was usually an ignorant and poverty-stricken man, and men of this class were contemptuously called "poor white trash." Hence I supposed that, since the non-slave-holders at the South were ignorant, poor, and degraded as a class, the non-slave-holders at the North must be in a similar condition. I could have landed in no part of the United States where I should have found a more striking and gratifying contrast, not only to life generally in the South, but in the condition of the colored people there, than in New Bedford. I was amazed when Mr. Johnson told me that there was nothing in the laws or constitution of Massachusetts that would prevent a colored man from being governor of the State, if the people should see fit to elect him. There, too, the black man's children attended the public

schools with the white man's children, and apparently without objection from any quarter. To impress me with my security from recapture and return to slavery, Mr. Johnson assured me that no slave-holder could take a slave out of New Bedford; that there were men there who would lay down their lives to save me from such a fate.

The fifth day after my arrival, I put on the clothes of a common laborer, and went upon the wharves in search of work. On my way down Union street I saw a large pile of coal in front of the house of Rev. Ephraim Peabody, the Unitarian minister. I went to the kitchen door and asked the privilege of bringing in and putting away this coal. "What will you charge?" said the lady. "I will leave that to you, madam." "You may put it away," she said. I was not long in accomplishing the job, when the dear lady put into my hand TWO SILVER HALF-DOLLARS. To understand the emotion which swelled my heart as I clasped this money, realizing that I had no master who could take it from me,--THAT IT WAS MINE--THAT MY HANDS WERE MY OWN, and could earn more of the precious coin,--one must have been in some sense himself a slave. My next job was stowing a sloop at Uncle Gid. Howland's wharf with a cargo of oil for New York. I was not only a freeman, but a free working-man, and no "master" stood ready at the end of the week to seize my hard earnings.

The season was growing late and work was plenty. Ships were being fitted out for whaling, and much wood was used in storing them. The sawing this wood was considered a good job. With the help of old Friend Johnson (blessings on his memory) I got a saw and "buck," and went at it. When I went into a store to buy a cord with which to brace up my saw in the frame, I asked for a "fip's" worth of cord. The man behind the counter looked rather sharply at me, and said with equal sharpness, "You don't belong about here." I was alarmed, and thought I had betrayed myself. A fip in Maryland was six and a quarter cents, called fourpence in Massachusetts. But no harm came from the "fi'penny-bit" blunder, and I confidently and cheerfully went to work with my saw and buck. It was new business to me, but I never did better work, or more of it, in the same space of time on the plantation for Covey, the negro-breaker, than I did for myself in these earliest years of my freedom.

Notwithstanding the just and humane sentiment of New Bedford three and forty years ago, the place was not entirely free from race and color prejudice. The good influence of the Roaches, Rodmans, Arnolds, Grinnells, and Robesons did not pervade all classes of its people. The test of the real civilization of the community came when I applied for work at my trade, and then my repulse was emphatic and decisive. It so happened that Mr. Rodney French, a wealthy and enterprising citizen, distinguished as an anti-slavery man, was fitting out a vessel for a whaling voyage, upon which there was a heavy job of calking and coppering to be done. I had some skill in both branches, and applied to Mr. French for work. He, generous man that he was, told me he would employ me, and I might go at once to the vessel. I obeyed him, but upon reaching the float-stage, where others [sic] calkers were at work, I was told that every white man would leave the ship, in her unfinished condition, if I struck a blow at my trade upon her. This uncivil, inhuman, and selfish treatment was not so shocking and scandalous in my eyes at the time as it now appears to me. Slavery had inured me to hardships that made ordinary trouble sit lightly upon me. Could I have worked at my trade I could have earned two dollars a day, but as a common laborer I received but one dollar. The difference was of great importance to me, but if I could not get two dollars, I was glad to get one; and so I went to work for Mr. French as a common laborer. The consciousness that I was free--no longer a slave--kept me cheerful under this, and many similar proscriptions, which I was destined to meet in New Bedford and elsewhere on the free soil of Massachusetts. For instance, though colored children attended the schools, and were treated kindly by their teachers, the New Bedford Lyceum refused, till several years after my residence in that city, to allow any colored person to attend the lectures delivered in its hall. Not until such men as Charles Sumner, Theodore Parker, Ralph Waldo Emerson, and Horace Mann refused to lecture in their course while there was such a restriction, was it abandoned.

Becoming satisfied that I could not rely on my trade in New Bedford to give me a living, I prepared myself to do any kind of work that came to hand. I sawed wood, shoveled coal, dug cellars, moved rubbish from back yards, worked on the wharves, loaded and unloaded vessels, and scoured their cabins.

I afterward got steady work at the brass-foundry owned by Mr. Richmond. My duty here was to blow the bellows, swing the crane, and empty the flasks in which castings were made; and at times this was hot and heavy work. The articles produced here were mostly for ship work, and in the busy season the foundry was in operation night and day. I have often worked two nights and every working day of the week. My foreman, Mr. Cobb, was a good man, and more than once protected me from abuse that one or more of the hands was disposed to throw upon me. While in this situation I had little time for mental improvement. Hard work, night and day, over a furnace hot enough to keep the metal running like water, was more favorable to action than thought; yet here I often nailed a newspaper to the post near my bellows, and read while I was performing the up and down motion of the heavy beam by which the bellows was inflated and discharged. It was the pursuit of knowledge under difficulties, and I look back to it now, after so many years, with some complacency and a little wonder that I could have been so earnest and persevering in any pursuit other

than for my daily bread. I certainly saw nothing in the conduct of those around to inspire me with such interest: they were all devoted exclusively to what their hands found to do. I am glad to be able to say that, during my engagement in this foundry, no complaint was ever made against me that I did not do my work, and do it well. The bellows which I worked by main strength was, after I left, moved by a steam-engine.

THE GOOPHERED GRAPEVINE by Charles W. Chesnutt

About ten years ago my wife was in poor health, and our family doctor, in whose skill and honesty I had implicit confidence, advised a change of climate. I was engaged in grape-culture in northern Ohio, and decided to look for a locality suitable for carrying on the same business in some Southern State. I wrote to a cousin who had gone into the turpentine business in central North Carolina, and he assured me that no better place could be found in the South than the State and neighborhood in which he lived: climate and soil were all that could be asked for, and land could be bought for a mere song. A cordial invitation to visit him while I looked into the matter was accepted. We found the weather delightful at that season, the end of the summer, and were most hospitably entertained. Our host placed a horse and buggy at our disposal, and himself acted as guide until I got somewhat familiar with the country.

I went several times to look at a place which I thought might suit me. It had been at one time a thriving plantation, but shiftless cultivation had well-night exhausted the soil. There had been a vineyard of some extent on the place, but it had not been attended to since the war, and had fallen into utter neglect. The vines--here partly supported by decayed and broken-down arbors, there twining themselves among the branches of the slender saplings which had sprung up among them--grew in wild and unpruned luxuriance, and the few scanty grapes which they bore were the undisputed prey of the first comer. The site was admirably adapted to grape-raising; the soil, with a little attention, could not have been better; and with the native grape, the luscious scuppernong, mainly to rely upon, I felt sure that I could introduce and cultivate successfully a number of other varieties.

One day I went over with my wife, to show her the place. We drove between the decayed gate-posts--the gate itself had long since disappeared--and up the straight, sandy lane to the open space where a dwelling-house had once stood. But the house had fallen a victim to the fortunes of war, and nothing remained of it except the brick pillars upon which the sills had rested. We alighted, and walked about the place for a while; but on Annie's complaining of weariness I led the way back to the yard, where a pine log, lying under a spreading elm, formed a shady though somewhat hard seat. One end of the log was already occupied by a venerable-looking colored man. He held on his knees a hat full of grapes, over which he was smacking his lips with great gusto, and a pile of grape-skins near him indicated that the performance was no new thing. He respectfully rose as we approached, and was moving away, when I begged him to keep his seat.

"Don't let us disturb you," I said. "There's plenty of room for us all."

He resumed his seat with somewhat of embarrassment.

"Do you live around here?" I asked, anxious to put him at his ease.

"Yas, suh. I lives des ober yander, behine de nex' san'-hill, on de Lumberton plank-road."

"Do you know anything about the time when this vineyard was cultivated?"

"Lawd bless yer, suh, I knows all about it. Dey ain' na'er a man in dis settlement w'at won' tell yer ole Julius McAdoo 'uz bawn an' raise' on dis yer same plantation. Is you de Norv'n gemman w'at's gwine ter buy de ole vimya'd?"

"I am looking at it," I replied; "but I don't know that I shall care to buy unless I can be reasonably sure of making something out of it."

"Well, suh, you is a stranger ter me, en I is a stranger ter you, en we is bofe strangers ter one anudder, but 'f I 'uz in yo' place, I wouldn' buy dis vimya'd."

"Why not?" I asked.

"Well, I dunner whe'r you b'lieves in cunj'in er not,--some er de w'ite folks don't, er says dey don't,--but de truf er de matter is dat dis yer ole vimya'd is goophered."

"Is what?" I asked, not grasping the meaning of this unfamiliar word.

"Is goophered, cunju'd, bewitch'."

He imparted this information with such solemn earnestness, and with such an air of confidential mystery, that I felt somewhat interested, while Annie was evidently much impressed, and drew closer to me.

"How do you know it is bewitched?" I asked.

"I wouldn' spec' fer you ter b'lieve me 'less you know all 'bout de fac's. But ef you en young miss dere doan' min' lis'n'in' ter a ole nigger run on a minute er two w'ile you er restin', I kin 'splain to yer how it all happen'."

We assured him that we would be glad to hear how it all happened, and he began to tell us. At first the current of his memory--or imagination--seemed somewhat sluggish; but as his embarrassment wore off, his language flowed more freely, and the story acquired perspective and coherence. As he became more and more absorbed in the narrative, his eyes assumed a dreamy expression, and he seemed to lose sight of his auditors, and to be living over again in monologue his life on the old plantation.

"Ole Mars Dugal' McAdoo bought dis place long many years befo' de wah, en I 'member well w'en he sot out all dis yer part er de plantation in scuppernon's. De vimes growed monst'us fas', en Mars Dugal' made a thousan' gallon er scuppernon' wine eve'y year.

"Now, ef dey's an'thing a nigger lub, nex' ter 'possum, en chick'n, en watermillyums, it's scuppernon's. Dey ain' nuffin dat kin stan' up side'n de scuppernon' fer sweetness; sugar ain't a suckumstance ter scuppernon'. W'en de season is nigh 'bout ober, en de grapes begin ter swivel up des a little wid de wrinkles er ole age,--w'en de skin git sof' en brown,--den de scuppernon' make you smack yo' lip en roll yo' eye en wush fer mo'; so I reckon it ain' very 'stonishin' dat niggers lub scuppernon'.

"Dey wuz a sight er niggers in de naberhood er de vimya'd. Dere wuz ole Mars Henry Brayboy's niggers, en ole Mars Dunkin McLean's niggers, en Mars Dugal's own niggers; den dey wuz a settlement er free niggers en po' buckrahs down by de Wim'l'ton Road, en Mars Dugal' had de only vimya'd in de naberhood. I reckon it ain' so much so nowadays, but befo' de wah, in slab'ry times, er nigger didn' mine goin' fi' er ten mile in a night, w'en dey wuz sump'n good ter eat at de yuther een.

"So atter a w'ile Mars Dugal' begin ter miss his scuppernon's. Co'se he 'cuse' de niggers er it, but dey all 'nied it ter de las'. Mars Dugal' sot spring guns en steel traps, en he en de oberseah sot up nights once't er twice't, tel one night Mars Dugal'--he 'uz a monst'us keerless man--got his leg shot full er cow-peas. But somehow er nudder dey couldn' nebber ketch none er de niggers. I dunner how it happen, but it happen des like I tell yer, en de grapes kep' on a-goin des de same.

"But bimeby ole Mars Dugal' fix' up a plan ter stop it. Dey 'uz a cunjuh 'ooman livin' down mongs' de free niggers on de Wim'l'ton Road, en all de darkies fum Rockfish ter Beaver Crick wuz feared uv her. She could wuk de mos' powerfulles' kind er goopher,--could make people hab fits er rheumatiz, er make 'em des dwinel away en die; en dey say she went out ridin' de niggers at night, for she wuz a witch 'sides bein' a cunjuh 'ooman. Mars Dugal' hearn 'bout Aun' Peggy's doin's, en begun ter 'flect whe'r er no he couldn' git her ter he'p him keep de niggers off'n de grapevimes. One day in de spring er de year, ole miss pack' up a basket er chick'n en poun'-cake, en a bottle er scuppernon' wine, en Mars Dugal' tuk it in his buggy en driv ober ter Aun' Peggy's cabin. He tuk de basket in, en had a long talk wid Aun' Peggy. De nex' day Aun' Peggy come up ter de vimya'd. De niggers seed her slippin' 'roun', en dey soon foun' out what she 'uz doin' dere. Mars Dugal' had hi'ed her ter goopher de grapevimes. She sa'ntered 'roun' mongs' de vimes, en tuk a leaf fum dis one, en a grape-hull fum dat one, en a grape-seed fum anudder one; en den a little twig fum here, en a little pinch er dirt fum dere,--en put it all in a big black bottle, wid a snake's toof en a speckle' hen's gall en some ha'rs fum a black cat's tail, en den fill' de bottle wid scuppernon' wine. W'en she got de goopher all ready en fix', she tuk 'n went out in de woods en buried it under de root uv a red oak tree, en den come back en tole one er de niggers she done goopher de grapevimes, en a'er a nigger w'at eat dem grapes 'ud be sho ter die inside'n twel' mont's.

"Atter dat de niggers let de scuppernon's 'lone, en Mars Dugal' didn' hab no 'casion ter fine no mo' fault; en de season wuz mos' gone, w'en a strange gemman stop at de plantation one night ter see Mars Dugal' on some business; en his coachman, seein' de scuppernon's growin' so nice en sweet, slip 'roun' behine de smoke-house, en et all de scuppernon's he could hole. Nobody didn' notice it at de time, but dat night, on de way home, de gemman's hoss runned away en kill' de coachman. W'en we hearn de noos, Aun' Lucy, de cook, she up 'n say she seed de strange nigger eat'n' er de scuppernon's behine de smoke-house; en den we knowed de goopher had b'en er wukkin. Den one er de nigger chilluns runned away fum de quarters one day, en got in de scuppernon's, en died de nex' week. W'ite folks say he die' er de fevuh, but de niggers knowed it wuz de goopher. So you k'n be sho de darkies didn' hab much ter do wid dem scuppernon' vimes.

"W'en de scuppernon' season 'uz ober fer dat year, Mars Dugal' foun' he had made fifteen hund'ed gallon er wine; en one er de niggers hearn him laffin' wid de oberseah fit ter kill, en sayin' dem fifteen hund'ed gallon er wine wuz monst'us good intrus' on de ten dollars he laid out on de vimya'd. So I 'low ez he paid Aun' Peggy ten dollars fer to goopher de grapevimes.

"De goopher didn' wuk no mo' tel de nex' summer, w'en 'long to'ds de middle er de season one er de fiel' han's died; en ez dat lef' Mars Dugal' sho't er han's, he went off ter town fer ter buy anudder. He fotch de noo nigger home wid 'im. He wuz er ole nigger, er de color er a gingy-cake, en ball ez a hoss-apple on de top er his head. He wuz a peart ole nigger, do', en could do a big day's wuk.

"Now it happen dat one er de niggers on de nex' plantation, one er ole Mars Henry Brayboy's niggers, had runned away de day befo', en tuk ter de swamp, en ole Mars Dugal' en some er de yuther nabor w'ite folks had gone out wid dere guns en dere dogs fer ter he'p 'em hunt fer de nigger; en de han's on our own plantation wuz all so flusterated dat we fuhgot ter tell de noo han' 'bout de goopher on de scuppernon' vimes. Co'se he smell de grapes en see de vimes, an atter dahk de fus' thing he done wuz ter slip off ter de grapevimes 'dout sayin' nuffin ter nobody. Nex' mawnin' he tole some er de niggers 'bout de fine bait er scuppernon' he et de night befo'.

"W'en dey tole 'im 'bout de goopher on de grapevimes, he 'uz dat tarrified dat he turn pale, en look des like he gwine ter die right in his tracks. De oberseah come up en axed w'at 'uz de matter; en w'en dey tole 'im Henry be'n eatin' er de scuppernon's, en got de goopher on 'im, he gin Henry a big drink er w'iskey, en 'low dat de nex' rainy day he take 'im ober ter Aun' Peggy's, en see ef she wouldn' take de goopher off'n him, seein' ez he didn' know nuffin erbout it tel he done et de grapes.

"Sho nuff, it rain de nex' day, en de oberseah went ober ter Aun' Peggy's wid Henry. En Aun' Peggy say dat bein' ez Henry didn' know 'bout de goopher, en et de grapes in ign'ance er de quinseconces, she reckon she mought be able fer ter take de goopher off'n him. So she fotch out er bottle wid some cunjuh medicine in it, en po'd some out in a go'd fer Henry ter drink. He manage ter git it down; he say it tas'e like whiskey wid sump'n bitter in it. She 'lowed dat 'ud keep de goopher off'n him tel de spring; but w'en de sap begin ter rise in de grapevimes he ha' ter come en see her agin, en she tell him w'at e's ter do.

"Nex' spring, w'en de sap commence' ter rise in de scuppernon' vime, Henry tuk a ham one night. Whar'd he git de ham? I doan know; dey wa'nt no hams on de plantation 'cep'n' w'at 'uz in de smoke-house, but I never see Henry 'bout de smoke-house. But ez I wuz a-sayin', he tuk de ham ober ter Aun' Peggy's; en Aun' Peggy tole 'im dat w'en Mars Dugal' begin ter prume de grapevimes, he mus' go en take 'n scrape off de sap whar it ooze out'n de cut een's er de vimes, en 'n'int his ball head wid it; en ef he do dat once't a year de goopher wouldn' wuk agin 'im long ez he done it. En bein' ez he fotch her de ham, she fix' it so he kin eat all de scuppernon' he want.

"So Henry 'n'int his head wid de sap out'n de big grapevime des ha'f way 'twix' de quarters en de big house, en de goopher nebber wuk agin him dat summer. But de beatenes' thing you eber see happen ter Henry. Up ter dat time he wuz ez ball ez a sweeten' 'tater, but des ez soon ez de young leaves begun ter come out on de grapevimes de ha'r begun ter grow out on Henry's head, en by de middle er de summer he had de bigges' head er ha'r on de plantation. Befo' dat, Henry had tol'able good ha'r 'roun de aidges, but soon ez de young grapes begun ter come Henry's ha'r begun ter quirl all up in little balls, des like dis yer reg'lar grapy ha'r, en by de time de grapes got ripe his head look des like a bunch er grapes. Combin' it didn' do no good; he wuk at it ha'f de night wid er Jim Crow [1], en think he git it straighten' out, but in de mawnin' de grapes 'ud be dere des de same. So he gin it up, en tried ter keep de grapes down by havin' his ha'r cut sho't."

[Footnote 1: A small card, resembling a curry-comb in construction, and used by negroes in the rural districts instead of a comb.]

"But dat wa'nt de quares' thing 'bout de goopher. When Henry come ter de plantation, he wuz gittin' a little ole an stiff in de j'ints. But dat summer he got des ez spry en libely ez any young nigger on de plantation; fac' he got so biggity dat Mars Jackson, de oberseah, ha' ter th'eaten ter whip 'im, ef he didn' stop cuttin' up his didos en behave hisse'f. But de mos' cur'ouses' thing happen' in de fall, when de sap begin ter go down in de grapevimes. Fus', when de grapes 'uz gethered, de knots begun ter straighten out'n Henry's h'ar; en w'en de leaves begin ter fall, Henry's ha'r begin ter drap out; en w'en de vimes 'uz b'ar, Henry's head wuz baller 'n it wuz in de spring, en he begin ter git ole en stiff in de j'ints ag'in, en paid no mo' tention ter de gals dyoin' er de whole winter. En nex' spring, w'en he rub de sap on ag'in, he got young ag'in, en so soopl en libely dat none er de young niggers on de plantation couldn' jump, ner dance, ner hoe ez much cotton ez Henry. But in de fall er de year his grapes begun ter straighten out, en his j'ints ter git stiff, en his ha'r drap off, en de rheumatiz begin ter wrastle wid 'im.

"Now, ef you'd a knowed ole Mars Dugal' McAdoo, you'd a knowed dat it ha' ter be a mighty rainy day when he couldn' fine sump'n fer his niggers ter do, en it ha' ter be a mighty little hole he couldn' crawl thoo, en ha' ter be a monst'us cloudy night w'en a dollar git by him in de dahkness; en w'en he see how Henry git young in de spring en ole in de fall, he 'lowed ter hisse'f ez how he could make mo' money outen Henry dan by wukkin' him in de cotton fiel'. 'Long de nex' spring, atter de sap commence' ter rise, en Henry 'n'int 'is head en commence fer ter git young en soopl, Mars Dugal' up 'n tuk Henry ter town, en sole 'im fer fifteen hunder' dollars. Co'se de man w'at bought Henry didn' know nuffin 'bout de goopher, en Mars Dugal' didn' see no 'casion fer ter tell 'im. Long to'ds de fall, w'en de sap went down, Henry begin ter git ole again same ez yuzhal, en his noo marster begin ter git skeered les'n he gwine ter lose his fifteen-hunder'-dollar nigger. He sent fer a mighty fine doctor, but de med'cine didn' 'pear ter do no good; de goopher had a good holt. Henry tole de doctor 'bout de goopher, but de doctor des laff at 'im.

"One day in de winter Mars Dugal' went ter town, en wuz santerin' 'long de Main Street, when who should he meet but Henry's noo marster. Dey said 'Hoddy,' en Mars Dugal' ax 'im ter hab a seegyar; en atter dey run on awhile 'bout de craps en de weather, Mars Dugal' ax 'im, sorter keerless, like ez ef he des thought of it,--

"'How you like de nigger I sole you las' spring?'

"Henry's marster shuck his head en knock de ashes off'n his seegyar.

"'Spec' I made a bad bahgin when I bought dat nigger. Henry done good wuk all de summer, but sence de fall set in he 'pears ter be sorter pinin' away. Dey ain' nuffin pertickler de matter wid 'im--leastways de doctor say so--'cep'n' a tech er de rheumatiz; but his ha'r is all fell out, en ef he don't pick up his strenk mighty soon, I spec' I'm gwine ter lose 'im."

"Dey smoked on awhile, en bimeby ole mars say, 'Well, a bahgin's a bahgin, but you en me is good fren's, en I doan wan' ter see you lose all de money you paid fer dat digger [sic]; en ef w'at you say is so, en I ain't 'sputin' it, he ain't wuf much now. I spec's you wukked him too ha'd dis summer, er e'se de swamps down here don't agree wid de san'-hill nigger. So you des lemme know, en ef he gits any wusser I'll be willin' ter gib yer five hund'ed dollars fer 'im, en take my chances on his livin'.'

"Sho nuff, when Henry begun ter draw up wid de rheumatiz en it look like he gwine ter die fer sho, his noo marster sen' fer Mars Dugal', en Mars Dugal' gin him what he promus, en brung Henry home ag'in. He tuk good keer uv 'im dyoin' er de winter,--give 'im w'iskey ter rub his rheumatiz, en terbacker ter smoke, en all he want ter eat,--'caze a nigger w'at he could make a thousan' dollars a year off'n didn' grow on eve'y huckleberry bush.

"Nex' spring, w'en de sap ris en Henry's ha'r commence' ter sprout, Mars Dugal' sole 'im ag'in, down in Robeson County dis time; en he kep' dat sellin' business up fer five year er mo'. Henry nebber say nuffin 'bout de goopher ter his noo marsters, 'caze he know he gwine ter be tuk good keer uv de nex' winter, w'en Mars Dugal' buy him back. En Mars Dugal' made 'nuff money off'n Henry ter buy anudder plantation ober on Beaver Crick.

"But long 'bout de een' er dat five year dey come a stranger ter stop at de plantation. De fus' day he 'uz dere he went out wid Mars Dugal' en spent all de mawnin' lookin' ober de vimya'd, en atter dinner dey spent all de evenin' playin' kya'ds. De niggers soon 'skiver' dat he wuz a Yankee, en dat he come down ter Norf C'lina fer ter learn de w'ite folks how to raise grapes en make wine. He promus Mars Dugal' he cud make de grapevimes b'ar twice't ez many grapes, en dat de noo wine-press he wuz a-sellin' would make mo' d'n twice't ez many gallons er wine. En ole Mars Dugal' des drunk it all in, des 'peared ter be bewitched wit dat Yankee. W'en de darkies see dat Yankee runnin' 'roun de vimya'd en diggin' under de grapevimes, dey shuk dere heads, en 'lowed dat dey feared Mars Dugal' losin' his min'. Mars Dugal' had all de dirt dug away fum under de roots er all de scuppernon' vimes, an' let 'em stan' dat away fer a week er mo'. Den dat Yankee made de niggers fix up a mixtry er lime en ashes en manyo, en po' it roun' de roots er de grapevimes. Den he 'vise' Mars Dugal' fer ter trim de vimes close't, en Mars Dugal' tuck 'n done eve'ything de Yankee tole him ter do. Dyoin' all er dis time, mind yer, 'e wuz libbin' off'n de fat er de lan', at de big house, en playin' kyards wid Mars Dugal' eve'y night; en dey say Mars Dugal' los' mo'n a thousan' dollars dyoin' er de week dat Yankee wuz a runnin' de grapevimes.

"W'en de sap ris nex' spring, ole Henry 'n'inted his head ez yuzhal, en his ha'r commence' ter grow des de same ez it done eve'y year. De scuppernon' vimes growed monst's fas', en de leaves wuz greener en thicker dan dey eber be'n dyowin my rememb'ance; en Henry's ha'r growed out thicker dan eber, en he 'peared ter git younger 'n younger, en soopler 'n soopler; en seein' ez he wuz sho't er han's dat spring, havin' tuk in consid'able noo groun', Mars Dugal' 'cluded he wouldn' sell Henry 'tel he git de crap in en de cotton chop'. So he kep' Henry on de plantation.

"But 'long 'bout time fer de grapes ter come on de scuppernon' vimes, dey 'peared ter come a change ober dem; de leaves wivered en swivel' up, en de young grapes turn' yaller, en bimeby eve'ybody on de plantation could see dat de whole vimya'd wuz dyin'. Mars Dugal' tuck 'n water de vimes en done all he could, but 't wan' no use: dat Yankee done bus' de watermillyum. One time de vimes picked up a bit, en Mars Dugal' thought dey wuz gwine ter come out ag'in; but dat Yankee done dug too close unde' de roots, en prune de branches too close ter de vime, en all dat lime en ashes done burn' de life outen de vimes, en dey des kep' a with'in' en a swivelin'.

"All dis time de goopher wuz a-wukkin'. W'en de vimes commence' ter wither, Henry commence' ter complain er his rheumatiz, en when de leaves begin ter dry up his ha'r commence' ter drap out. When de vimes fresh up a bit Henry 'ud git peart agin, en when de vimes wither agin Henry 'ud git ole agin, en des kep' gittin' mo' en mo' fitten fer nuffin; he des pined away, en fine'ly tuk ter his cabin; en when de big vime whar he got de sap ter 'n'int his head withered en turned yaller en died, Henry died too,--des went out sorter like a cannel. Dey didn't 'pear ter be nuffin de matter wid 'im, 'cep'n de rheumatiz, but his strenk des dwinel' away 'tel he didn' hab ernuff lef' ter draw his bref. De goopher had got de under holt, en th'owed Henry fer good en all dat time.

"Mars Dugal' tuk on might'ly 'bout losin' his vimes en his nigger in de same year; en he swo' dat ef he could git hold er dat Yankee he'd wear 'im ter a frazzle, en den chaw up de frazzle; en he'd done it, too, for Mars Dugal' 'uz a monst'us brash man w'en he once git started. He sot de vimya'd out ober agin, but it wuz th'ee er fo' year befo' de vimes got ter b'arin' any scuppernon's.

"W'en de wah broke out, Mars Dugal' raise' a comp'ny, en went off ter fight de Yankees. He saw he wuz mighty glad dat wah come, en he des want ter kill a Yankee fer eve'y dollar he los' 'long er dat grape-raisin' Yankee. En I 'spec' he would a done it, too, ef de Yankees hadn' s'picioned sump'n, en killed him fus'. Atter de s'render ole miss move' ter town, de niggers all scattered 'way fum de plantation, en de vimya'd ain' be'n cultervated sence."

"Is that story true?" asked Annie, doubtfully, but seriously, as the old man concluded his narrative.

"It's des ez true ez I'm a-settin' here, miss. Dey's a easy way ter prove it: I kin lead de way right ter Henry's grave ober yander in de plantation buryin'-groun'. En I tell yer w'at, marster, I wouldn' 'vise yer to buy dis yer ole vimya'd, 'caze de goopher's on it yit, en dey ain' no tellin' w'en it's gwine ter crap out."

"But I thought you said all the old vines died."

"Dey did 'pear ter die, but a few ov 'em come out ag'in, en is mixed in mongs' de yuthers. I ain' skeered ter eat de grapes, 'caze I knows de old vimes fum de noo ones; but wid strangers dey ain' no tellin' w'at might happen. I wouldn' 'vise yer ter buy dis vimya'd."

I bought the vineyard, nevertheless, and it has been for a long time in a thriving condition, and is referred to by the local press as a striking illustration of the opportunities open to Northern capital in the development of Southern industries. The luscious scuppernong holds first rank among our grapes, though we cultivate a great many other varieties, and our income from grapes packed and shipped to the Northern markets is quite considerable. I have not noticed any developments of the goopher in the vineyard, although I have a mild suspicion that our colored assistants do not suffer from want of grapes during the season.

I found, when I bought the vineyard, that Uncle Julius had occupied a cabin on the place for many years, and derived a respectable revenue from the neglected grapevines. This, doubtless, accounted for his advice to me not to buy the vineyard, though whether it inspired the goopher story I am unable to state. I believe, however, that the wages I pay him for his services are more than an equivalent for anything he lost by the sale of the vineyard.

PO' SANDY by Charles W. Chesnutt

On the northeast corner of my vineyard in central North Carolina, and fronting on the Lumberton plank-road, there stood a small frame house, of the simplest construction. It was built of pine lumber, and contained but one room, to which one window gave light and one door admission. Its weather-beaten sides revealed a virgin innocence of paint. Against one end of the house, and occupying half its width, there stood a huge brick chimney: the crumbling mortar had left large cracks between the bricks; the bricks themselves had begun to scale off in large flakes, leaving the chimney sprinkled with unsightly blotches. These evidences of decay were but partially concealed by a creeping vine, which extended its slender branches hither and thither in an ambitious but futile attempt to cover the whole chimney. The wooden shutter, which had once protected the unglazed window, had fallen from its hinges, and lay rotting in the rank grass and jimson-weeds beneath. This building, I learned when I bought the place, had been used as a school-house for several years prior to the breaking out of the war, since which time it had remained unoccupied, save

when some stray cow or vagrant hog had sought shelter within its walls from the chill rains and nipping winds of winter.

One day my wife requested me to build her a new kitchen. The house erected by us, when we first came to live upon the vineyard, contained a very conveniently arranged kitchen; but for some occult reason my wife wanted a kitchen in the back yard, apart from the dwelling-house, after the usual Southern fashion. Of course I had to build it.

To save expense, I decided to tear down the old school-house, and use the lumber, which was in a good state of preservation, in the construction of the new kitchen. Before demolishing the old house, however, I made an estimate of the amount of material contained in it, and found that I would have to buy several hundred feet of new lumber in order to build the new kitchen according to my wife's plan.

One morning old Julius McAdoo, our colored coachman, harnessed the gray mare to the rockaway, and drove my wife and me over to the saw-mill from which I meant to order the new lumber. We drove down the long lane which led from our house to the plank-road; following the plank-road for about a mile, we turned into a road running through the forest and across the swamp to the sawmill beyond. Our carriage jolted over the half-rotted corduroy road which traversed the swamp, and then climbed the long hill leading to the saw-mill. When we reached the mill, the foreman had gone over to a neighboring farm-house, probably to smoke or gossip, and we were compelled to await his return before we could transact our business. We remained seated in the carriage, a few rods from the mill, and watched the leisurely movements of the mill-hands. We had not waited long before a huge pine log was placed in position, the machinery of the mill was set in motion, and the circular saw began to eat its way through the log, with a loud whirr which resounded throughout the vicinity of the mill. The sound rose and fell in a sort of rhythmic cadence, which, heard from where we sat, was not unpleasing, and not loud enough to prevent conversation. When the saw started on its second journey through the log, Julius observed, in a lugubrious tone, and with a perceptible shudder:--

"Ugh! but dat des do cuddle my blood!"

"What's the matter, Uncle Julius?" inquired my wife, who is of a very sympathetic turn of mind. "Does the noise affect your nerves?"

"No, Miss Annie," replied the old man, with emotion, "I ain' narvous; but dat saw, a-cuttin' en grindin' thoo dat stick er timber, en moanin', en groanin', en sweekin', kyars my 'memb'ance back ter ole times, en 'min's me er po' Sandy." The pathetic intonation with which he lengthened out the "po' Sandy" touched a responsive chord in our own hearts.

"And who was poor Sandy?" asked my wife, who takes a deep interest in the stories of plantation life which she hears from the lips of the older colored people. Some of these stories are quaintly humorous; others wildly extravagant, revealing the Oriental cast of the negro's imagination; while others, poured freely into the sympathetic ear of a Northern-bred woman, disclose many a tragic incident of the darker side of slavery.

"Sandy," said Julius, in reply to my wife's question, "was a nigger w'at useter b'long ter ole Mars Marrabo McSwayne. Mars Marrabo's place wuz on de yuther side'n de swamp, right nex' ter yo' place. Sandy wuz a monst'us good nigger, en could do so many things erbout a plantation, en alluz 'ten ter his wuk so well, dat w'en Mars Marrabo's chilluns growed up en married off, dey all un 'em wanted dey daddy fer ter gin 'em Sandy fer a weddin' present. But Mars Marrabo knowed de res' wouldn' be satisfied ef he gin Sandy ter a'er one un 'em; so w'en dey wuz all done married, he fix it by 'lowin' one er his chilluns ter take Sandy fer a mont' er so, en den ernudder for a mont' er so, en so on dat erway tel dey had all had 'im de same lenk er time; en den dey would all take him roun' ag'in, 'cep'n oncet in a w'ile w'en Mars Marrabo would len' 'im ter some er his yuther kinfolks 'roun' de country, w'en dey wuz short er han's; tel bimeby it go so Sandy didn' hardly knowed whar he wuz gwine ter stay fum one week's een ter de yuther.

"One time w'en Sandy wuz lent out ez yushal, a spekilater come erlong wid a lot er niggers, en Mars Marrabo swap' Sandy's wife off fer a noo 'oman. W'en Sandy come back, Mars Marrabo gin 'im a dollar, en 'lowed he wuz monst'us sorry fer ter break up de fambly, but de spekilater had gin 'im big boot, en times wuz hard en money skase, en so he wuz bleedst ter make de trade. Sandy tuk on some 'bout losin' his wife, but he soon seed dey want no use cryin' ober spilt merlasses; en bein' ez he lacked de looks er de noo 'ooman, he tuk up wid her atter she b'n on de plantation a mont' er so.

"Sandy en his noo wife got on mighty well tergedder, en de niggers all 'mence' ter talk about how lovin' dey wuz. W'en Tenie wuz tuk sick oncet, Sandy useter set up all night wid 'er, en den go ter wuk in de mawnin' des lack he had his reg'lar sleep; en Tenie would 'a done anythin' in de worl' for her Sandy.

"Sandy en Tenie hadn' b'en libbin' tergedder fer mo' d'n two mont's befo' Mars Marrabo's old uncle, w'at libbed down in Robeson County, sent up ter fine out ef Mars Marrabo couldn' len' 'im er hire 'im a good han' fer a mont' er so. Sandy's marster wuz one er dese yer easy-gwine folks w'at wanter please eve'ybody, en he says yas, he could len' 'im Sandy. En Mars Marrabo tole Sandy fer ter git ready ter go down ter Robeson nex' day, fer ter stay a mont' er so.

"Hit wuz monst'us hard on Sandy fer ter take 'im 'way fum Tenie. Hit wuz so fur down ter Robeson dat he didn' hab no chance er comin' back ter see her tel de time wuz up; he wouldn' a' mine comin' ten er fifteen mile at night ter see Tenie, but Mars Marrabo's uncle's plantation wuz mo' d'n forty mile off. Sandy wuz mighty sad en cas' down atter w'at Mars Marrabo tole 'im, en he says ter Tenie, sezee:--

"'I'm gittin monstus ti'ed er dish yer gwine roun' so much. Here I is lent ter Mars Jeems dis mont', en I got ter do so-en-so; en ter Mars Archie de nex' mont', en I got ter do so-en-so; den I got ter go ter Miss Jinnie's: en hit's Sandy dis en Sandy dat, en Sandy yer en Sandy dere, tel it 'pears ter me I ain' got no home, ner no marster, ner no mistiss, ner no nuffin'. I can't eben keep a wife: my yuther ole 'oman wuz sole away widout my gittin' a chance fer ter tell her good-by; en now I got ter go off en leab you, Tenie, en I dunno whe'r I'm eber gwine ter see yer ag'in er no. I wisht I wuz a tree, er a stump, er a rock, er sump'n w'at could stay on de plantation fer a w'ile.'

"Atter Sandy got thoo talkin', Tenie didn' say naer word, but des sot dere by de fier, studyin' en studyin'. Bimeby she up'n says:--

"'Sandy, is I eber tole you I wuz a cunjuh-'ooman?'

"Co'se Sandy hadn' nebber dremp' er nuffin lack dat, en he made a great miration w'en he hear w'at Tenie say. Bimeby Tenie went on:--

"'I ain' goophered nobody, ner done no cunjuh-wuk fer fifteen yer er mo; en w'en I got religion I made up my mine I wouldn' wuk no mo' goopher. But dey is some things I doan b'lieve it's no sin fer ter do; en ef you doan wanter be sent roun' fum pillar ter pos', en ef you doan wanter go down ter Robeson, I kin fix things so yer won't haf ter. Ef you'll des say de word, I kin turn yer ter w'ateber yer wanter be, en yer kin stay right whar yer wanter, ez long ez yer mineter.'

"Sandy say he doan keer; he's willin' fer ter do anythin' fer ter stay close ter Tenie. Den Tenie ax 'im ef he doan wanter be turnt inter a rabbit.

"Sandy say, 'No, de dogs mout git atter me.'

"'Shill I turn yer ter a wolf?' sez Tenie.

"'No, eve'ybody's skeered er a wolf, en I doan want nobody ter be skeered er me.'

"'Shill I turn yer ter a mawkin'-bird?'

"'No, a hawk mout ketch me. I wanter be turnt inter sump'n w'at'll stay in one place.'

"'I kin turn yer ter a tree,' sez Tenie. 'You won't hab no mouf ner years, but I kin turn yer back oncet in a w'ile, so yer kin git sump'n ter eat, en hear w'at's gwine on.'

"Well, Sandy say dat'll do. En so Tenie tuk 'im down by de aidge er de swamp, not fur fum de quarters, en turnt 'im inter a big pine-tree, en sot 'im out mongs' some yuther trees. En de nex' mawnin', ez some er de fiel' han's wuz gwine long dere, dey seed a tree w'at dey didn' 'member er habbin' seed befo; it wuz monst'us quare, en dey wuz bleedst ter 'low dat dey hadn' 'membered right, er e'se one er de saplin's had be'n growin' monst'us fas'.

"W'en Mars Marrabo 'skiver' dat Sandy wuz gone, he 'lowed Sandy had runned away. He got de dogs out, but de las' place dey could track Sandy ter wuz de foot er dat pine-tree. En dere de dogs stood en barked, en bayed, en pawed at de tree, en tried ter climb up on it; en w'en dey wuz tuk roun' thoo de swamp ter look fer de scent, dey broke loose en made fer dat tree ag'in. It wuz de beatenis' thing de w'ite folks eber hearn of, en Mars Marrabo 'lowed dat Sandy must a' clim' up on de tree en jump' off on a mule er sump'n, en rid fur 'nuff fer ter spile de scent. Mars Marrabo wanted ter 'cuse some er de yuther niggers er heppin Sandy off, but dey all 'nied it ter de las'; en eve'ybody knowed Tenie sot too much by Sandy fer ter he'p 'im run away whar she couldn' nebber see 'im no mo'.

"W'en Sandy had be'n gone long 'nuff fer folks ter think he done got clean away, Tenie useter go down ter de woods at night en turn 'im back, en den dey'd slip up ter de cabin en set by de fire en talk. But dey ha' ter be monst'us keerful, er e'se somebody would a seed 'em, en dat would a spile de whole thing; so Tenie alluz turnt Sandy back in de mawnin' early, befo' anybody wuz a'stirrin'.

"But Sandy didn' git erlong widout his trials en tribberlations. One day a woodpecker come erlong en 'mence' ter peck at de tree; en de nex' time Sandy wuz turnt back he had a little roun' hole in his arm, des lack a sharp stick be'n stuck in it. Atter dat Tenie sot a sparrer-hawk fer ter watch de tree; en w'en de woodpecker come erlong nex' mawnin' fer ter finish his nes', he got gobble' up mos' fo' he stuck his bill in de bark.

"Nudder time, Mars Marrabo sent a nigger out in de woods fer ter chop tuppentime boxes. De man chop a box in dish yer tree, en hack' de bark up two er th'ee feet, fer ter let de tuppentime run. De nex' time Sandy wuz turnt back he had a big skyar on his lef' leg, des lack it be'n skunt; en it tuk Tenie nigh 'bout all night fer ter fix a mixtry ter kyo it up. Atter dat, Tenie sot a hawnet fer ter watch de tree; en w'en de nigger come back ag'in fer ter cut ernudder box on de yuther side'n de tree, de hawnet stung 'im so hard dat de ax slip en cut his foot nigh 'bout off.

"W'en Tenie see so many things happenin' ter de tree, she 'cluded she'd ha' ter turn Sandy ter sump'n e'se; en atter studyin' de matter ober, en talkin' wid Sandy one ebenin', she made up her mine fer ter fix up a goopher mixtry w'at would turn herse'f en Sandy ter foxes, er sump'n, so dey could run away en go some'rs whar dey could be free en lib lack w'ite folks.

"But dey ain' no tellin' w'at's gwine ter happen in dis worl'. Tenie had got de night sot fer her en Sandy ter run away, w'en dat ve'y day one er Mars Marrabo's sons rid up ter de big house in his buggy, en say his wife wuz monst'us sick, en he want his mammy ter len' 'im a 'ooman fer ter nuss his wife. Tenie's mistiss say sen Tenie; she wuz a good nuss. Young mars wuz in a tarrible hurry fer ter git back home. Tenie wuz washin' at de big house dat day, en her mistiss say she should go right 'long wid her young marster. Tenie tried ter make some 'scuse fer ter git away en hide tel night, w'en she would have eve'ything fix' up fer her en Sandy; she say she wanter go ter her cabin fer ter git her bonnet. Her mistiss say it doan matter 'bout de bonnet; her head-hankcher wuz good 'nuff. Den Tenie say she wanter git her bes' frock; her mistiss say no, she doan need no mo' frock, en w'en dat one got dirty she could git a clean one whar she wuz gwine. So Tenie had ter git in de buggy en go 'long wid young Mars Dunkin ter his plantation, w'ich wuz mo' d'n twenty mile away; en dey want no chance er her seein' Sandy no mo' tel she come back home. De po' gal felt monst'us bad erbout de way things wuz gwine on, en she knowed Sandy mus' be a wond'rin' why she didn' come en turn 'im back no mo'.

"W'iles Tenie wuz away nussin' young Mars Dunkin's wife, Mars Marrabo tuk a notion fer ter buil' 'im a noo kitchen; en bein' ez he had lots er timber on his place, he begun ter look 'roun' fer a tree ter hab de lumber sawed out'n. En I dunno how it come to be so, but he happen fer ter hit on de ve'y tree w'at Sandy wuz turnt inter. Tenie wuz gone, en dey wa'n't nobody ner nuffin' fer ter watch de tree.

"De two men w'at cut de tree down say dey nebber had sech a time wid a tree befo': dey axes would glansh off, en didn' 'pear ter make no progress thoo de wood; en of all de creakin', en shakin', en wobblin' you eber see, dat tree done it w'en it commence' ter fall. It wuz de beatenis' thing!

"W'en dey got de tree all trim' up, dey chain it up ter a timber waggin, en start fer de saw-mill. But dey had a hard time gittin' de log dere: fus' dey got stuck in de mud w'en dey wuz gwine crosst de swamp, en it wuz two er th'ee hours befo' dey could git out. W'en dey start' on ag'in, de chain kep' a-comin' loose, en dey had ter keep a-stoppin' en a-stoppin' fer ter hitch de log up ag'in. W'en dey commence' ter climb de hill ter de saw-mill, de log broke loose, en roll down de hill en in mongs' de trees, en hit tuk nigh 'bout half a day mo' ter git it haul' up ter de saw-mill.

"De nex' mawnin' atter de day de tree wuz haul' ter de saw-mill, Tenie come home. W'en she got back ter her cabin, de fus' thing she done wuz ter run down ter de woods en see how Sandy wuz gittin' on. W'en she seed de stump standin' dere, wid de sap runnin' out'n it, en de limbs layin' scattered roun', she nigh 'bout went out'n her mine. She run ter her cabin, en got her goopher mixtry, en den foller de track er de timber waggin ter de saw-mill. She knowed Sandy couldn' lib mo' d'n a minute er so ef she turn' him back, fer he wuz all chop' up so he'd a be'n bleedst ter die. But she wanted ter turn 'im back long ernuff fer ter 'splain ter 'im dat she hadn' went off a-purpose, en lef' 'im ter be chop' down en sawed up. She didn' want Sandy ter die wid no hard feelin's to'ds her.

"De han's at de saw-mill had des got de big log on de kerridge, en wuz startin' up de saw, w'en dey seed a 'oman runnin up de hill, all out er bref, cryin' en gwine on des lack she wuz plumb 'stracted. It wuz Tenie; she come right inter de mill, en th'owed herse'f on de log, right in front er de saw, a-hollerin' en cryin' ter her Sandy ter fergib her, en not ter think hard er her, fer it wa'n't no fault er

hern. Den Tenie 'membered de tree didn' hab no years, en she wuz gittin' ready fer ter wuk her goopher mixtry so ez ter turn Sandy back, w'en de mill-hands kotch holt er her en tied her arms wid a rope, en fasten' her to one er de posts in de saw-mill; en den dey started de saw up ag'in, en cut de log up inter bo'ds en scantlin's right befo' her eyes. But it wuz mighty hard wuk; fer of all de sweekin', en moanin', en groanin', dat log done it w'iles de saw wuz a-cuttin' thoo it. De saw wuz one er dese yer ole-timey, up-en-down saws, en hit tuk longer dem days ter saw a log 'en it do now. Dey greased de saw, but dat didn' stop de fuss; hit kep' right on, tel finely dey got de log all sawed up.

"W'en de oberseah w'at run de saw-mill come fum brekfas', de han's up en tell him 'bout de crazy 'ooman--ez dey s'posed she wuz--w'at had come runnin' in de saw-mill, a-hollerin' en gwine on, en tried ter th'ow herse'f befo' de saw. En de oberseah sent two er th'ee er de han's fer ter take Tenie back ter her marster's plantation.

"Tenie 'peared ter be out'n her mine fer a long time, en her marster ha' ter lock her up in de smoke-'ouse tel she got ober her spells. Mars Marrabo wuz monst'us mad, en hit would a made yo' flesh crawl fer ter hear him cuss, caze he say de spekilater w'at he got Tenie fum had fooled 'im by wukkin' a crazy 'oman off on him. Wiles Tenie wuz lock up in de smoke-'ouse, Mars Marrabo tuk'n' haul de lumber fum de saw-mill, en put up his noo kitchen.

"W'en Tenie got quiet' down, so she could be 'lowed ter go 'roun' de plantation, she up'n tole her marster all erbout Sandy en de pine-tree; en w'en Mars Marrabo hearn it, he 'lowed she wuz de wuss 'stracted nigger he eber hearn of. He didn' know w'at ter do wid Tenie: fus' he thought he'd put her in de po'-house; but finely, seein' ez she didn' do no harm ter nobody ner nuffin', but des went roun' moanin', en groanin', en shakin' her head, he 'cluded ter let her stay on de plantation en nuss de little nigger chilluns w'en dey mammies wuz ter wuk in de cotton-fiel'.

"De noo kitchen Mars Marrabo buil' wuzn' much use, fer it hadn' be'n put up long befo' de niggers 'mence' ter notice quare things erbout it. Dey could hear sump'n moanin' en groanin' 'bout de kitchen in de night-time, en w'en de win' would blow dey could hear sump'n a-hollerin' en sweekin' lack hit wuz in great pain en sufferin'. En hit got so atter a w'ile dat hit wuz all Mars Marrabo's wife could do ter git a 'ooman ter stay in de kitchen in de daytime long ernuff ter do de cookin'; en dey wa'n't naer nigger on de plantation w'at wouldn' rudder take forty dan ter go 'bout dat kitchen atter dark,--dat is, 'cep'n Tenie; she didn' pear ter mine de ha'nts. She useter slip 'roun' at night, en set on de kitchen steps, en lean up agin de do'-jamb, en run on ter herse'f wid some kine er foolishness w'at nobody couldn' make out; fer Mars Marrabo had th'eaten' ter sen' her off'n de plantation ef she say anything ter any er de yuther niggers 'bout de pine-tree. But somehow er nudder de niggers foun' out all 'bout it, en dey knowed de kitchen wuz ha'anted by Sandy's sperrit. En bimeby hit got so Mars Marrabo's wife herse'f wuz skeered ter go out in de yard atter dark.

"W'en it come ter dat, Mars Marrabo tuk 'n' to' de kitchen down, en use' de lumber fer ter buil' dat ole school-'ouse w'at youer talkin' 'bout pullin' down. De school-'ouse wuzn' use' 'cep'n' in de daytime, en on dark nights folks gwine 'long de road would hear quare soun's en see quare things. Po' ole Tenie useter go down dere at night, en wander 'roun' de school-'ouse; en de niggers all 'lowed she went fer ter talk wid Sandy's sperrit. En one winter mawnin', w'en one er de boys went ter school early fer ter start de fire, w'at should he fine but po' ole Tenie, layin' on de flo', stiff, en cole, en dead. Dere didn' 'pear ter be nuffin' pertickler de matter wid her,--she had des grieve' herse'f ter def fer her Sandy. Mars Marrabo didn' shed no tears. He thought Tenie wuz crazy, en dey wa'n't no tellin' w'at she mout do nex'; en dey ain' much room in dis worl' fer crazy w'ite folks, let 'lone a crazy nigger.

"Hit wa'n't long atter dat befo' Mars Marrabo sole a piece er his track er lan' ter Mars Dugal' McAdoo,--MY ole marster,--en dat's how de ole school-house happen to be on yo' place. W'en de wah broke out, de school stop', en de ole school-'ouse be'n stannin' empty ever sence,--dat is, 'cep'n' fer de ha'nts. En folks sez dat de ole school-'ouse, er any yuther house w'at got any er dat lumber in it w'at wuz sawed out'n de tree w'at Sandy wuz turnt inter, is gwine ter be ha'nted tel de las' piece er plank is rotted en crumble' inter dus'."

Annie had listened to this gruesome narrative with strained attention.

"What a system it was," she exclaimed, when Julius had finished, "under which such things were possible!"

"What things?" I asked, in amazement. "Are you seriously considering the possibility of a man's being turned into a tree?"

"Oh, no," she replied quickly, "not that;" and then she added absently, and with a dim look in her fine eyes, "Poor Tenie!"

We ordered the lumber, and returned home. That night, after we had gone to bed, and my wife had to all appearances been sound asleep for half an hour, she startled me out of an incipient doze by exclaiming suddenly,--

"John, I don't believe I want my new kitchen built out of the lumber in that old school-house."

"You wouldn't for a moment allow yourself," I replied, with some asperity, "to be influenced by that absurdly impossible yarn which Julius was spinning to-day?"

"I know the story is absurd," she replied dreamily, "and I am not so silly as to believe it. But I don't think I should ever be able to take any pleasure in that kitchen if it were built out of that lumber. Besides, I think the kitchen would look better and last longer if the lumber were all new."

Of course she had her way. I bought the new lumber, though not without grumbling. A week or two later I was called away from home on business. On my return, after an absence of several days, my wife remarked to me,--

"John, there has been a split in the Sandy Run Colored Baptist Church, on the temperance question. About half the members have come out from the main body, and set up for themselves. Uncle Julius is one of the seceders, and he came to me yesterday and asked if they might not hold their meetings in the old school-house for the present."

"I hope you didn't let the old rascal have it," I returned, with some warmth. I had just received a bill for the new lumber I had bought.

"Well," she replied, "I could not refuse him the use of the house for so good a purpose."

"And I'll venture to say," I continued, "that you subscribed something toward the support of the new church?"

She did not attempt to deny it.

"What are they going to do about the ghost?" I asked, somewhat curious to know how Julius would get around this obstacle.

"Oh," replied Annie, "Uncle Julius says that ghosts never disturb religious worship, but that if Sandy's spirit SHOULD happen to stray into meeting by mistake, no doubt the preaching would do it good."

DAVE'S NECKLISS by Charles W. Chesnutt

"Have some dinner, Uncle Julius?" said my wife.

It was a Sunday afternoon in early autumn. Our two women-servants had gone to a camp-meeting some miles away, and would not return until evening. My wife had served the dinner, and we were just rising from the table, when Julius came up the lane, and, taking off his hat, seated himself on the piazza.

The old man glanced through the open door at the dinner-table, and his eyes rested lovingly upon a large sugar-cured ham, from which several slices had been cut, exposing a rich pink expanse that would have appealed strongly to the appetite of any hungry Christian.

"Thanky, Miss Annie," he said, after a momentary hesitation, "I dunno ez I keers ef I does tas'e a piece er dat ham, ef yer'll cut me off a slice un it."

"No," said Annie, "I won't. Just sit down to the table and help yourself; eat all you want, and don't be bashful."

Julius drew a chair up to the table, while my wife and I went out on the piazza. Julius was in my employment; he took his meals with his own family, but when he happened to be about our house at meal-times, my wife never let him go away hungry.

I threw myself into a hammock, from which I could see Julius through an open window. He ate with evident relish, devoting his attention chiefly to the ham, slice after slice of which disappeared in the spacious cavity of his mouth. At first the old man ate rapidly, but after the edge of his appetite had been taken off he proceeded in a more leisurely manner. When he had cut the sixth slice of ham (I kept count of them from a lazy curiosity to see how much he COULD eat) I saw him lay it on his plate; as he adjusted the knife and fork to cut it into smaller pieces, he paused, as if struck by a sudden thought, and a tear rolled down his rugged cheek and fell upon the slice of ham before him. But the emotion, whatever the thought that caused it, was transitory, and in a moment he continued his dinner. When he was through eating, he came out on the porch, and resumed his seat with the satisfied expression of countenance that usually follows a good dinner.

"Julius," I said, "you seemed to be affected by something, a moment ago. Was the mustard so strong that it moved you to tears?"

"No, suh, it wa'n't de mustard; I wuz studyin' 'bout Dave."

"Who was Dave, and what about him?" I asked.

The conditions were all favorable to story-telling. There was an autumnal languor in the air, and a dreamy haze softened the dark green of the distant pines and the deep blue of the Southern sky. The generous meal he had made had put the old man in a very good humor. He was not always so, for his curiously undeveloped nature was subject to moods which were almost childish in their variableness. It was only now and then that we were able to study, through the medium of his recollection, the simple but intensely human inner life of slavery. His way of looking at the past seemed very strange to us; his view of certain sides of life was essentially different from ours. He never indulged in any regrets for the Arcadian joyousness and irresponsibility which was a somewhat popular conception of slavery; his had not been the lot of the petted house-servant, but that of the toiling field-hand. While he mentioned with a warm appreciation the acts of kindness which those in authority had shown to him and his people, he would speak of a cruel deed, not with the indignation of one accustomed to quick feeling and spontaneous expression, but with a furtive disapproval which suggested to us a doubt in his own mind as to whether he had a right to think or to feel, and presented to us the curious psychological spectacle of a mind enslaved long after the shackles had been struck off from the limbs of its possessor. Whether the sacred name of liberty ever set his soul aglow with a generous fire; whether he had more than the most elementary ideas of love, friendship, patriotism, religion,--things which are half, and the better half, of life to us; whether he even realized, except in a vague, uncertain way, his own degradation, I do not know. I fear not; and if not, then centuries of repression had borne their legitimate fruit. But in the simple human feeling, and still more in the undertone of sadness, which pervaded his stories, I thought I could see a spark which, fanned by favoring breezes and fed by the memories of the past, might become in his children's children a glowing flame of sensibility, alive to every thrill of human happiness or human woe.

"Dave use' ter b'long ter my ole marster," said Julius; "he wuz raise' on dis yer plantation, en I kin 'member all erbout 'im, fer I wuz ole 'nuff ter chop cotton w'en it all happen'. Dave wuz a tall man, en monst'us strong: he could do mo' wuk in a day dan any yuther two niggers on de plantation. He wuz one er dese yer solemn kine er men, en nebber run on wid much foolishness, like de yuther darkies. He use' ter go out in de woods en pray; en w'en he hear de han's on de plantation cussin' en gwine on wid dere dancin' en foolishness, he use' ter tell 'em 'bout religion en jedgmen'-day, w'en dey would haf ter gin account fer eve'y idle word en all dey yuther sinful kyarin's-on.

"Dave had l'arn' how ter read de Bible. Dey wuz a free nigger boy in de settlement w'at wuz monst'us smart, en could write en cipher, en wuz alluz readin' books er papers. En Dave had hi'ed dis free boy fer ter l'arn 'im how ter read. Hit wuz 'g'in de law, but co'se none er de niggers didn' say nuffin ter de w'ite folks 'bout it. Howsomedever, one day Mars Walker--he wuz de oberseah--foun' out Dave could read. Mars Walker wa'n't nuffin but a po' bockrah, en folks said he couldn' read ner write hisse'f, en co'se he didn' lack ter see a nigger w'at knowed mo' d'n he did; so he went en tole Mars Dugal'. Mars Dugal' sont fer Dave, en ax' 'im 'bout it.

"Dave didn't hardly knowed w'at ter do; but he couldn' tell no lie, so he 'fessed he could read de Bible a little by spellin' out de words. Mars Dugal' look' mighty solemn.

"'Dis yer is a se'ious matter,' sezee; 'it's 'g'in de law ter l'arn niggers how ter read, er 'low 'em ter hab books. But w'at yer l'arn out'n dat Bible, Dave?'

"Dave wa'n't no fool, ef he wuz a nigger, en sezee:--

"'Marster, I l'arns dat it's a sin fer ter steal, er ter lie, er fer ter want w'at doan b'long ter yer; en I l'arns fer ter love de Lawd en ter 'bey my marster.'

"Mars Dugal' sorter smile' en laf' ter hisse'f, like he 'uz might'ly tickle' 'bout sump'n, en sezee:--

"'Doan 'pear ter me lack readin' de Bible done yer much harm, Dave. Dat's w'at I wants all my niggers fer ter know. Yer keep right on readin', en tell de yuther han's w'at yer be'n tellin' me. How would yer lack fer ter preach ter de niggers on Sunday?'

"Dave say he'd be glad fer ter do w'at he could. So Mars Dugal' tole de oberseah fer ter let Dave preach ter de niggers, en tell 'em w'at wuz in de Bible, en it would he'p ter keep 'em fum stealin' er runnin' erway.

"So Dave 'mence' ter preach, en done de han's on de plantation a heap er good, en most un 'em lef' off dey wicked ways, en 'mence' ter love ter hear 'bout God, en religion, en de Bible; en dey done dey wuk better, en didn' gib de oberseah but mighty little

trouble fer ter manage 'em.

"Dave wuz one er dese yer men w'at didn' keer much fer de gals,--leastways he didn' tel Dilsey come ter de plantation. Dilsey wuz a monst'us peart, good-lookin', gingybread-colored gal,--one er dese yer high-steppin' gals w'at hol's dey heads up, en won' stan' no foolishness fum no man. She had b'long' ter a gemman over on Rockfish, w'at died, en whose 'state ha' ter be sol' fer ter pay his debts. En Mars Dugal' had b'en ter de oction, en w'en he seed dis gal a-cryin' en gwine on 'bout bein' sol' erway fum her ole mammy, Aun' Mahaly, Mars Dugal' bid 'em bofe in, en fotch 'em ober ter our plantation.

"De young nigger men on de plantation wuz des wil' atter Dilsey, but it didn' do no good, en none un 'em couldn' git Dilsey fer dey junesey,[2] 'tel Dave 'mence' fer ter go roun' Aun' Mahaly's cabin. Dey wuz a fine-lookin' couple, Dave en Dilsey wuz, bofe tall, en well-shape', en soopl'. En dey sot a heap by one ernudder. Mars Dugal' seed 'em tergedder one Sunday, en de nex' time he seed Dave atter dat, sezee:--

"Dave, w'en yer en Dilsey gits ready fer ter git married, I ain' got no rejections. Dey's a poun' er so er chawin'-terbacker up at de house, en I reckon yo' mist'iss kin fine a frock en a ribbin er two fer Dilsey. Youer bofe good niggers, en yer neenter be feared er bein' sol' 'way fum one ernudder long ez I owns dis plantation; en I 'spec's ter own it fer a long time yit.'"

[Footnote 2: Sweetheart.]

"But dere wuz one man on de plantation w'at didn' lack ter see Dave en Dilsey tergedder ez much ez ole marster did. W'en Mars Dugal' went ter de sale whar he got Dilsey en Mahaly, he bought ernudder han', by de name er Wiley. Wiley wuz one er dese yer shiny-eyed, double-headed little niggers, sha'p ez a steel trap, en sly ez de fox w'at keep out'n it. Dis yer Wiley had be'n pesterin' Dilsey 'fo' she come ter our plantation, en had nigh 'bout worried de life out'n her. She didn' keer nuffin fer 'im, but he pestered her so she ha' ter th'eaten ter tell her marster fer ter make Wiley let her 'lone. W'en he come ober to our place it wuz des ez bad, 'tel bimeby Wiley seed dat Dilsey had got ter thinkin' a heap 'bout Dave, en den he sorter hilt off aw'ile, en purten' lack he gin Dilsey up. But he wuz one er dese yer 'ceitful niggers, en w'ile he wuz laffin' en jokin' wid de yuther han's 'bout Dave en Dilsey, he wuz settin' a trap fer ter ketch Dave en git Dilsey back fer hisse'f.

"Dave en Dilsey made up dere min's fer ter git married long 'bout Christmas time, w'en dey'd hab mo' time fer a weddin'. But 'long 'bout two weeks befo' dat time ole mars 'mence' ter lose a heap er bacon. Eve'y night er so somebody 'ud steal a side er bacon, er a ham, er a shoulder, er sump'n, fum one er de smoke-'ouses. De smoke-'ouses wuz lock', but somebody had a key, en manage' ter git in some way er 'nudder. Dey's mo' ways 'n one ter skin a cat, en dey's mo' d'n one way ter git in a smoke-'ouse,--leastways dat's w'at I hearn say. Folks w'at had bacon fer ter sell didn' hab no trouble 'bout gittin' rid un it. Hit wuz 'g'in' de law fer ter buy things fum slabes; but Lawd! dat law didn' 'mount ter a hill er peas. Eve'y week er so one er dese yer big covered waggins would come 'long de road, peddlin' terbacker en w'iskey. Dey wuz a sight er room in one er dem big waggins, en it wuz monst'us easy fer ter swop off bacon fer sump'n ter chaw er ter wa'm yer up in de winter-time. I s'pose de peddlers didn' knowed dey wuz breakin' de law, caze de niggers alluz went at night, en stayed on de dark side er de waggin; en it wuz mighty hard fer ter tell W'AT kine er folks dey wuz.

"Atter two er th'ee hund'ed er meat had be'n stole', Mars Walker call all de niggers up one ebenin', en tol' 'em dat de fus' nigger he cot stealin' bacon on dat plantation would git sump'n fer ter 'member it by long ez he lib'. En he say he'd gin fi' dollars ter de nigger w'at 'skiver' de rogue. Mars Walker say he s'picion' one er two er de niggers, but he couldn' tell fer sho, en co'se dey all 'nied it w'en he 'cuse em un it.

"Dey wa'n't no bacon stole' fer a week er so, 'tel one dark night w'en somebody tuk a ham fum one er de smoke-'ouses. Mars Walker des cusst awful w'en he foun' out de ham wuz gone, en say he gwine ter sarch all de niggers' cabins; w'en dis yer Wiley I wuz tellin' yer 'bout up'n say he s'picion' who tuk de ham, fer he seed Dave comin' 'cross de plantation fum to'ds de smoke-'ouse de night befo'. W'en Mars Walker hearn dis fum Wiley, he went en sarch' Dave's cabin, en foun' de ham hid under de flo'.

"Eve'ybody wuz 'stonish'; but dere wuz de ham. Co'se Dave 'nied it ter de las', but dere wuz de ham. Mars Walker say it wuz des ez he 'spected: he didn' b'lieve in dese yer readin' en prayin' niggers; it wuz all 'pocrisy, en sarve' Mars Dugal' right fer 'lowin' Dave ter be readin' books w'en it wuz 'g'in de law.

"W'en Mars Dugal' hearn 'bout de ham, he say he wuz might'ly 'ceived en disapp'inted in Dave. He say he wouldn' nebber hab no mo' conferdence in no nigger, en Mars Walker could do des ez he wuz a mineter wid Dave er any er de res' er de niggers. So Mars Walker tuk'n tied Dave up en gin 'im forty; en den he got some er dis yer wire clof w'at dey uses fer ter make sifters out'n, en tuk'n

wrap' it roun' de ham en fasten it tergedder at de little een'. Den he tuk Dave down ter de blacksmif-shop, en had Unker Silas, de plantation black-smif, fasten a chain ter de ham, en den fasten de yuther een' er de chain roun' Dave's neck. En den he says ter Dave, sezee:--

"'Now, suh, yer'll wear dat neckliss fer de nex' six mont's; en I 'spec's yer ner none er de yuther niggers on dis plantation won' steal no mo' bacon dyoin' er dat time.'

"Well, it des 'peared ez if fum dat time Dave didn' hab nuffin but trouble. De niggers all turnt ag'in' 'im, caze he be'n de 'casion er Mars Dugal' turnin' 'em all ober ter Mars Walker. Mars Dugal' wa'n't a bad marster hisse'f, but Mars Walker wuz hard ez a rock. Dave kep' on sayin' he didn' take de ham, but none un 'em didn' b'lieve 'im.

"Dilsey wa'n't on de plantation w'en Dave wuz 'cused er stealin' de bacon. Ole mist'iss had sont her ter town fer a week er so fer ter wait on one er her darters w'at had a young baby, en she didn' fine out nuffin 'bout Dave's trouble 'tel she got back ter de plantation. Dave had patien'ly endyoed de finger er scawn, en all de hard words w'at de niggers pile' on 'im, caze he wuz sho' Dilsey would stan' by 'im, en wouldn' b'lieve he wuz a rogue, ner none er de yuther tales de darkies wuz tellin' 'bout 'im.

"W'en Dilsey come back fum town, en got down fum behine de buggy whar she be'n ridin' wid ole mars, de fus' nigger 'ooman she met says ter her,--

"'Is yer seed Dave, Dilsey?'

"No, I ain' seed Dave,' says Dilsey.

"'Yer des oughter look at dat nigger; reckon yer wouldn' want 'im fer yo' junesey no mo'. Mars Walker cotch 'im stealin' bacon, en gone en fasten' a ham roun' his neck, so he can't git it off'n hisse'f. He sut'nly do look quare.' En den de 'ooman bus' out laffin' fit ter kill herse'f. W'en she got thoo laffin' she up'n tole Dilsey all 'bout de ham, en all de yuther lies w'at de niggers be'n tellin' on Dave.

"W'en Dilsey started down ter de quarters, who should she meet but Dave, comin' in fum de cotton-fiel'. She turnt her head ter one side, en purten' lack she didn' seed Dave.

"'Dilsey!' sezee.

"Dilsey walk' right on, en didn' notice 'im.

"'OH, Dilsey!'

"Dilsey didn' paid no 'tention ter 'im, en den Dave knowed some er de niggers be'n tellin' her 'bout de ham. He felt monst'us bad, but he 'lowed ef he could des git Dilsey fer ter listen ter 'im fer a minute er so, he could make her b'lieve he didn' stole de bacon. It wuz a week er two befo' he could git a chance ter speak ter her ag'in; but fine'ly he cotch her down by de spring one day, en sezee:--

"'Dilsey, w'at fer yer won' speak ter me, en purten' lack yer doan see me? Dilsey, yer knows me too well fer ter b'lieve I'd steal, er do dis yuther wick'ness de niggers is all layin' ter me,--yer KNOWS I wouldn' do dat, Dilsey. Yer ain' gwine back on yo' Dave, is yer?'

"But w'at Dave say didn' hab no 'fec' on Dilsey. Dem lies folks b'en tellin' her had p'isen' her min' 'g'in' Dave.

"'I doan wanter talk ter no nigger,' says she, 'w'at be'n whip' fer stealin', en w'at gwine roun' wid sich a lookin' thing ez dat hung roun' his neck. I's a 'spectable gal, I is. W'at yer call dat, Dave? Is dat a cha'm fer ter keep off witches, er is it a noo kine er neckliss yer got?'

"Po' Dave didn' knowed w'at ter do. De las' one he had 'pended on fer ter stan' by 'im had gone back on 'im, en dey didn' 'pear ter be nuffin mo' wuf libbin' fer. He couldn' hol' no mo' pra'r-meetin's, fer Mars Walker wouldn' 'low 'im ter preach, en de darkies wouldn' 'a' listen' ter 'im ef he had preach'. He didn' eben hab his Bible fer ter comfort hisse'f wid, fer Mars Walker had tuk it erway fum 'im en burnt it up, en say ef he ketch any mo' niggers wid Bibles on de plantation he'd do 'em wuss'n he done Dave.

"En ter make it still harder fer Dave, Dilsey tuk up wid Wiley. Dave could see him gwine up ter Aun' Mahaly's cabin, en settin' out on de bench in de moonlight wid Dilsey, en singin' sinful songs en playin' de banjer. Dave use' ter scrouch down behine de bushes, en wonder w'at de Lawd sen' 'im all dem tribberlations fer.

"But all er Dave's yuther troubles wa'n't nuffin side er dat ham. He had wrap' de chain roun' wid a rag, so it didn' hurt his neck; but w'eneber he went ter wuk, dat ham would be in his way; he had ter do his task, howsomedever, des de same ez ef he didn' hab de

ham. W'eneber he went ter lay down, dat ham would be in de way. Ef he turn ober in his sleep, dat ham would be tuggin' at his neck. It wuz de las' thing he seed at night, en de fus' thing he seed in de mawnin'. W'eneber he met a stranger, de ham would be de fus' thing de stranger would see. Most un 'em would 'mence' ter laf, en whareber Dave went he could see folks p'intin' at him, en year 'em sayin:--

"'W'at kine er collar dat nigger got roun' his neck?' er, ef dey knowed 'im, 'Is yer stole any mo' hams lately?' er 'W'at yer take fer yo' neckliss, Dave?' er some joke er 'nuther 'bout dat ham.

"Fus' Dave didn' mine it so much, caze he knowed he hadn' done nuffin. But bimeby he got so he couldn' stan' it no longer, en he'd hide hisse'f in de bushes w'eneber he seed anybody comin', en alluz kep' hisse'f shet up in his cabin atter he come in fum wuk.

"It wuz monst'us hard on Dave, en bimeby, w'at wid dat ham eberlastin' en etarnally draggin' roun' his neck, he 'mence' fer ter do en say quare things, en make de niggers wonder ef he wa'n't gittin' out'n his mine. He got ter gwine roun' talkin' ter hisse'f, en singin' corn-shuckin' songs, en laffin' fit ter kill 'bout nuffin. En one day he tole one er de niggers he had 'skivered a noo way fer ter raise hams,--gwine ter pick 'em off'n trees, en save de expense er smoke-'ouses by kyoin' 'em in de sun. En one day he up'n tole Mars Walker he got sump'n pertickler fer ter say ter 'im; en he tuk Mars Walker off ter one side, en tole 'im he wuz gwine ter show 'im a place in de swamp whar dey wuz a whole trac' er lan' covered wid ham-trees.

"W'en Mars Walker hearn Dave talkin' dis kine er fool-talk, en w'en he seed how Dave wuz 'mencin' ter git behine in his wuk, en w'en he ax' de niggers en dey tole 'im how Dave be'n gwine on, he 'lowed he reckon' he'd punish' Dave ernuff, en it mou't do mo' harm dan good fer ter keep de ham on his neck any longer. So he sont Dave down ter de blacksmif-shop en had de ham tak off. Dey wa'n't much er de ham lef' by dat time, fer de sun had melt all de fat, en de lean had all swivel' up, so dey wa'n't but th'ee er fo' poun's lef'.

"W'en de ham had be'n tuk off'n Dave, folks kinder stopped talkin' 'bout 'im so much. But de ham had be'n on his neck so long dat Dave had sorter got use' ter it. He look des lack he'd los' sump'n fer a day er so atter de ham wuz tuk off, en didn' 'pear ter know w'at ter do wid hisse'f; en fine'ly he up'n tuk'n tied a lightered-knot ter a string, en hid it under de flo' er his cabin, en w'en nobody wuzn' lookin' he'd take it out en hang it roun' his neck, en go off in de woods en holler en sing; en he allus tied it roun' his neck w'en he went ter sleep. Fac', it 'peared lack Dave done gone clean out'n his mine. En atter a w'ile he got one er de quarest notions you eber hearn tell un. It wuz 'bout dat time dat I come back ter de plantation fer ter wuk,--I had be'n out ter Mars Dugal's yuther place on Beaver Crick for a mont' er so. I had hearn 'bout Dave en de bacon, en 'bout w'at wuz gwine on on de plantation; but I didn' b'lieve w'at dey all say 'bout Dave, fer I knowed Dave wa'n't dat kine er man. One day atter I come back, me'n Dave wuz choppin' cotton tergedder, w'en Dave lean' on his hoe, en motion' fer me ter come ober close ter 'im; en den he retch' ober en w'ispered ter me.

"'Julius', [sic] sezee, 'did yer knowed yer wuz wukkin' long yer wid a ham?'

"I couldn 'magine w'at he meant. 'G'way fum yer, Dave,' says I. 'Yer ain' wearin' no ham no mo'; try en fergit 'bout dat; 't ain' gwine ter do yer no good fer ter 'member it.'

"Look a-yer, Julius,' sezee, 'kin yer keep a secret?'

"'Co'se I kin, Dave,' says I. 'I doan go roun' tellin' people w'at yuther folks says ter me.'

"'Kin I trus' yer, Julius? Will yer cross yo' heart?'

"I cross' my heart. 'Wush I may die ef I tells a soul,' says I.

"Dave look' at me des lack he wuz lookin' thoo me en 'way on de yuther side er me, en sezee:--

"'Did yer knowed I wuz turnin' ter a ham, Julius?'

"I tried ter 'suade Dave dat dat wuz all foolishness, en dat he oughtn't ter be talkin' dat-a-way,--hit wa'n't right. En I tole 'im ef he'd des be patien', de time would sho'ly come w'en eve'ything would be straighten' out, en folks would fine out who de rale rogue wuz w'at stole de bacon. Dave 'peared ter listen ter w'at I say, en promise' ter do better, en stop gwine on dat-a-way; en it seem lack he pick' up a bit w'en he seed dey wuz one pusson didn' b'lieve dem tales 'bout 'im.

"Hit wa'n't long atter dat befo' Mars Archie McIntyre, ober on de Wimbleton road, 'mence' ter complain 'bout somebody stealin' chickens fum his hen-'ouse. De chickens kip' on gwine, en at las' Mars Archie tole de han's on his plantation dat he gwine ter shoot de fus' man he ketch in his hen-'ouse. In less'n a week atter he gin dis warnin', he cotch a nigger in de hen-'ouse, en fill' 'im full er squir'l-shot. W'en he got a light, he 'skivered it wuz a strange nigger; en w'en he call' one er his own sarven's, de nigger tole 'im it wuz our Wiley. W'en Mars Archie foun' dat out, he sont ober ter our plantation fer ter tell Mars Dugal' he had shot one er his niggers, en dat he could sen' ober dere en git w'at wuz lef' un 'im.

"Mars Dugal' wuz mad at fus'; but w'en he got ober dere en hearn how it all happen', he didn' hab much ter say. Wiley wuz shot so bad he wuz sho' he wuz gwine ter die, so he up'n says ter ole marster:--

"'Mars Dugal',' sezee, 'I knows I's be'n a monst'us bad nigger, but befo' I go I wanter git sump'n off'n my mine. Dave didn' steal dat bacon w'at wuz tuk out'n de smoke-'ouse. I stole it all, en I hid de ham under Dave's cabin fer ter th'ow de blame on him--en may de good Lawd fergib me fer it.'

"Mars Dugal' had Wiley tuk back ter de plantation, en sont fer a doctor fer ter pick de shot out'n 'im. En de ve'y nex' mawnin' Mars Dugal' sont fer Dave ter come up ter de big house; he felt kinder sorry fer de way Dave had be'n treated. Co'se it wa'n't no fault er Mars Dugal's, but he wuz gwine ter do w'at he could fer ter make up fer it. So he sont word down ter de quarters fer Dave en all de yuther han's ter 'semble up in de yard befo' de big house at sun-up nex' mawnin'.

"Yearly in de mawnin' de niggers all swarm' up in de yard. Mars Dugal' wuz feelin' so kine dat he had brung up a bairl er cider, en tole de niggers all fer ter he'p deyselves.

"All dey han's on de plantation come but Dave; en bimeby, w'en it seem lack he wa'n't comin', Mars Dugal' sont a nigger down ter de quarters ter look fer 'im. De sun wuz gittin' up, en dey wuz a heap er wuk ter be done, en Mars Dugal' sorter got ti'ed waitin'; so he up'n says:--

"'Well, boys en gals, I sont fer yer all up yer fer ter tell yer dat all dat 'bout Dave's stealin' er de bacon wuz a mistake, ez I s'pose yer all done hearn befo' now, en I's mighty sorry it happen'. I wants ter treat all my niggers right, en I wants yer all ter know dat I sets a heap by all er my han's w'at is hones' en smart. En I want yer all ter treat Dave des lack yer did befo' dis thing happen', en mine w'at he preach ter yer; fer Dave is a good nigger, en has had a hard row ter hoe. En de fus' one I ketch sayin' anythin' 'g'in Dave, I'll tell Mister Walker ter gin 'im forty. Now take ernudder drink er cider all roun', en den git at dat cotton, fer I wanter git dat Persimmon Hill trac' all pick' ober ter-day.'

"W'en de niggers wuz gwine 'way, Mars Dugal' tole me fer ter go en hunt up Dave, en bring 'im up ter de house. I went down ter Dave's cabin, but couldn' fine 'im dere. Den I look' roun' de plantation, en in de aidge er de woods, en 'long de road; but I couldn' fine no sign er Dave. I wuz 'bout ter gin up de sarch, w'en I happen' fer ter run 'cross a foot-track w'at look' lack Dave's. I had wukked 'long wid Dave so much dat I knowed his tracks: he had a monst'us long foot, wid a holler instep, w'ich wuz sump'n skase 'mongs' black folks. So I follered dat track 'cross de fiel' fum de quarters 'tel I got ter de smoke-'ouse. De fus' thing I notice' wuz smoke comin' out'n de cracks: it wuz cu'ous, caze dey hadn' be'n no hogs kill' on de plantation fer six mont' er so, en all de bacon in de smoke-'ouse wuz done kyoed. I couldn' 'magine fer ter sabe my life w'at Dave wuz doin' in dat smoke-'ouse. I went up ter de do' en hollered:--

"'Dave!'

"Dey didn' nobody answer. I didn' wanter open de do', fer w'ite folks is monst'us pertickler 'bout dey smoke-'ouses; en ef de oberseah had a-come up en cotch me in dere, he mou't not wanter b'lieve I wuz des lookin' fer Dave. So I sorter knock at de do' en call' out ag'in:--

"'O Dave, hit's me--Julius! Doan be skeered. Mars Dugal' wants yer ter come up ter de big house,--he done 'skivered who stole de ham.'

"But Dave didn' answer. En w'en I look' roun' ag'in en didn' seed none er his tracks gwine way fum de smoke-'ouse, I knowed he wuz in dere yit, en I wuz 'termine' fer ter fetch 'im out; so I push de do' open en look in.

"Dey wuz a pile er bark burnin' in de middle er de flo', en right ober de fier, hangin' fum one er de rafters, wuz Dave; dey wuz a rope roun' his neck, en I didn' haf ter look at his face mo' d'n once fer ter see he wuz dead.

"Den I knowed how it all happen'. Dave had kep' on gittin' wusser en wusser in his mine, 'tel he des got ter b'lievin' he wuz all done turnt ter a ham; en den he had gone en built a fier, en tied a rope roun' his neck, des lack de hams wuz tied, en had hung hisse'f up in de smoke-'ouse fer ter kyo.

"Dave wuz buried down by de swamp, in de plantation buryin'-groun'. Wiley didn' died fum de woun' he got in Mars McIntyre's hen-'ouse; he got well atter a w'ile, but Dilsey wouldn' hab nuffin mo' ter do wid 'im, en 't wa'n't long 'fo' Mars Dugal' sol' 'im ter a spekilater on his way souf,--he say he didn' want no sich a nigger on de plantation, ner in de county, ef he could he'p it. En w'en de een' er de year come, Mars Dugal' turnt Mars Walker off, en run de plantation hisse'f atter dat.

"Eber sence den," said Julius in conclusion, "w'eneber I eats ham, it min's me er Dave. I lacks ham, but I nebber kin eat mo' d'n two er th'ee poun's befo' I gits ter studyin' 'bout Dave, en den I has ter stop en leab de res' fer ernudder time."

There was a short silence after the old man had finished his story, and then my wife began to talk to him about the weather, on which subject he was an authority. I went into the house. When I came out, half an hour later, I saw Julius disappearing down the lane, with a basket on his arm.

At breakfast, next morning, it occurred to me that I should like a slice of ham. I said as much to my wife.

"Oh, no, John," she responded, "you shouldn't eat anything so heavy for breakfast."

I insisted.

"The fact is," she said, pensively, "I couldn't have eaten any more of that ham, and so I gave it to Julius."

THE AWAKENING OF THE NEGRO by Booker T. Washington

When a mere boy, I saw a young colored man, who had spent several years in school, sitting in a common cabin in the South, studying a French grammar. I noted the poverty, the untidiness, the want of system and thrift, that existed about the cabin, notwithstanding his knowledge of French and other academic subjects. Another time, when riding on the outer edges of a town in the South, I heard the sound of a piano coming from a cabin of the same kind. Contriving some excuse, I entered, and began a conversation with the young colored woman who was playing, and who had recently returned from a boarding-school, where she had been studying instrumental music among other things. Despite the fact that her parents were living in a rented cabin, eating poorly cooked food, surrounded with poverty, and having almost none of the conveniences of life, she had persuaded them to rent a piano for four or five dollars per month. Many such instances as these, in connection with my own struggles, impressed upon me the importance of making a study of our needs as a race, and applying the remedy accordingly.

Some one may be tempted to ask, Has not the negro boy or girl as good a right to study a French grammar and instrumental music as the white youth? I answer, Yes, but in the present condition of the negro race in this country there is need of something more. Perhaps I may be forgiven for the seeming egotism if I mention the expansion of my own life partly as an example of what I mean. My earliest recollection is of a small one-room log hut on a large slave plantation in Virginia. After the close of the war, while working in the coal-mines of West Virginia for the support of my mother, I heart in some accidental way of the Hampton Institute. When I learned that it was an institution where a black boy could study, could have a chance to work for his board, and at the same time be taught how to work and to realize the dignity of labor, I resolved to go there. Bidding my mother good-by, I started out one morning to find my way to Hampton, though I was almost penniless and had no definite idea where Hampton was. By walking, begging rides, and paying for a portion of the journey on the steam-cars, I finally succeeded in reaching the city of Richmond, Virginia. I was without money or friends. I slept under a sidewalk, and by working on a vessel next day I earned money to continue my way to the institute, where I arrived with a surplus of fifty cents. At Hampton I found the opportunity--in the way of buildings, teachers, and industries provided by the generous--to get training in the class-room and by practical touch with industrial life, to learn thrift, economy, and push. I was surrounded by an atmosphere of business, Christian influence, and a spirit of self-help that seemed to have awakened every faculty in me, and caused me for the first time to realize what it meant to be a man instead of a piece of property.

While there I resolved that when I had finished the course of training I would go into the far South, into the Black Belt of the South, and give my life to providing the same kind of opportunity for self-reliance and self-awakening that I had found provided for me at Hampton. My work began at Tuskegee, Alabama, in 1881, in a small shanty and church, with one teacher and thirty students, without a dollar's worth of property. The spirit of work and of industrial thrift, with aid from the State and generosity from the North,

has enabled us to develop an institution of eight hundred students gathered from nineteen States, with seventy-nine instructors, fourteen hundred acres of land, and thirty buildings, including large and small; in all, property valued at $280,000. Twenty-five industries have been organized, and the whole work is carried on at an annual cost of about $80,000 in cash; two fifths of the annual expense so far has gone into permanent plant.

What is the object of all this outlay? First, it must be borne in mind that we have in the South a peculiar and unprecedented state of things. It is of the utmost importance that our energy be given to meeting conditions that exist right about us rather than conditions that existed centuries ago or that exist in countries a thousand miles away. What are the cardinal needs among the seven millions of colored people in the South, most of whom are to be found on the plantations? Roughly, these needs may be stated as food, clothing, shelter, education, proper habits, and a settlement of race relations. The seven millions of colored people of the South cannot be reached directly by any missionary agency, but they can be reached by sending out among them strong selected young men and women, with the proper training of head, hand, and heart, who will live among these masses and show them how to lift themselves up.

The problem that the Tuskegee Institute keeps before itself constantly is how to prepare these leaders. From the outset, in connection with religious and academic training, it has emphasized industrial or hand training as a means of finding the way out of present conditions. First, we have found the industrial teaching useful in giving the student a chance to work out a portion of his expenses while in school. Second, the school furnishes labor that has an economic value, and at the same time gives the student a chance to acquire knowledge and skill while performing the labor. Most of all, we find the industrial system valuable in teaching economy, thrift, and the dignity of labor, and in giving moral backbone to students. The fact that a student goes out into the world conscious of his power to build a house or a wagon, or to make a harness, gives him a certain confidence and moral independence that he would not possess without such training.

A more detailed example of our methods at Tuskegee may be of interest. For example, we cultivate by student labor six hundred and fifty acres of land. The object is not only to cultivate the land in a way to make it pay our boarding department, but at the same time to teach the students, in addition to the practical work, something of the chemistry of the soil, the best methods of drainage, dairying, the cultivation of fruit, the care of livestock and tools, and scores of other lessons needed by a people whose main dependence is on agriculture. Notwithstanding that eighty-five per cent of the colored people in the South live by agriculture in some form, aside from what has been done by Hampton, Tuskegee, and one or two other institutions practically nothing has been attempted in the direction of teaching them about the very industry from which the masses of our people must get their subsistence. Friends have recently provided means for the erection of a large new chapel at Tuskegee. Our students have made the bricks for this chapel. A large part of the timber is sawed by students at our own sawmill, the plans are drawn by our teacher of architecture and mechanical drawing, and students do the brick-masonry, plastering, painting, carpentry work, tinning, slating, and make most of the furniture. Practically, the whole chapel will be built and furnished by student labor; in the end the school will have the building for permanent use, and the students will have a knowledge of the trades employed in its construction. In this way all but three of the thirty buildings on the grounds have been erected. While the young men do the kinds of work I have mentioned, the young women to a large extent make, mend, and launder the clothing of the young men, and thus are taught important industries.

One of the objections sometimes urged against industrial education for the negro is that it aims merely to teach him to work on the same plan that he was made to follow when in slavery. This is far from being the object at Tuskegee. At the head of each of the twenty-five industrial departments we have an intelligent and competent instructor, just as we have in our history classes, so that the student is taught not only practical brick-masonry, for example, but also the underlying principles of that industry, the mathematics and the mechanical and architectural drawing. Or he is taught how to become master of the forces of nature so that, instead of cultivating corn in the old way, he can use a corn cultivator, that lays off the furrows, drops the corn into them, and covers it, and in this way he can do more work than three men by the old process of corn-planting; at the same time much of the toil is eliminated and labor is dignified. In a word, the constant aim is to show the student how to put brains into every process of labor; how to bring his knowledge of mathematics and the sciences into farming, carpentry, forging, foundry work; how to dispense as soon as possible with the old form of ante-bellum labor. In the erection of the chapel just referred to, instead of letting the money which was given us go into outside hands, we make it accomplish three objects: first, it provides the chapel; second, it gives the students a chance to get a practical knowledge of the trades connected with building; and third, it enables them to earn something toward the payment of board while receiving academic and industrial training.

Having been fortified at Tuskegee by education of mind, skill of hand, Christian character, ideas of thrift, economy, and push, and a spirit of independence, the student is sent out to become a centre of influence and light in showing the masses of our people in the

Black Belt of the South how to lift themselves up. How can this be done? I give but one or two examples. Ten years ago a young colored man came to the institute from one of the large plantation districts; he studied in the class-room a portion of the time, and received practical and theoretical training on the farm the remainder of the time. Having finished his course at Tuskegee, he returned to his plantation home, which was in a county where the colored people outnumber the whites six to one, as is true of many of the counties in the Black Belt of the South. He found the negroes in debt. Ever since the war they had been mortgaging their crops for the food on which to live while the crops were growing. The majority of them were living from hand to mouth on rented land, in small, one-room log cabins, and attempting to pay a rate of interest on their advances that ranged from fifteen to forty per cent per annum. The school had been taught in a wreck of a log cabin, with no apparatus, and had never been in session longer than three months out of twelve. With as many as eight or ten persons of all ages and conditions and of both sexes huddled together in one cabin year after year, and with a minister whose only aim was to work upon the emotions of the people, one can imagine something of the moral and religious state of the community.

But the remedy. In spite of the evil, the negro got the habit of work from slavery. The rank and file of the race, especially those on the Southern plantations, work hard, but the trouble is, what they earn gets away from them in high rents, crop mortgages, whiskey, snuff, cheap jewelry, and the like. The young man just referred to had been trained at Tuskegee, as most of our graduates are, to meet just this condition of things. He took the three months' public school as a nucleus for his work. Then he organized the older people into a club, or conference, that held meetings every week. In these meetings he taught the people in a plain, simple manner how to save their money, how to farm in a better way, how to sacrifice,--to live on bread and potatoes, if need be, till they could get out of debt, and begin the buying of lands.

Soon a large proportion of the people were in condition to make contracts for the buying of homes (land is very cheap in the South), and to live without mortgaging their crops. Not only this: under the guidance and leadership of this teacher, the first year that he was among them they learned how, by contributions in money and labor, to build a neat, comfortable schoolhouse that replaced the wreck of a log cabin formerly used. The following year the weekly meetings were continued, and two months were added to the original three months of school. The next year two more months were added. The improvement has gone on, until now these people have every year an eight months' school.

I wish my readers could have the chance that I have had of going into this community. I wish they could look into the faces of the people and see them beaming with hope and delight. I wish they could see the two or three room cottages that have taken the place of the usual one-room cabin, the well-cultivated farms, and the religious life of the people that now means something more than the name. The teacher has a good cottage and a well-kept farm that serve as models. In a word, a complete revolution has been wrought in the industrial, educational, and religious life of this whole community by reason of the fact that they have had this leader, this guide and object-lesson, to show them how to take the money and effort that had hitherto been scattered to the wind in mortgages and high rents, in whiskey and gewgaws, and concentrate them in the direction of their own uplifting. One community on its feet presents an object-lesson for the adjoining communities, and soon improvements show themselves in other places.

Another student who received academic and industrial training at Tuskegee established himself, three years ago, as a blacksmith and wheelwright in a community, and, in addition to the influence of his successful business enterprise, he is fast making the same kind of changes in the life of the people about him that I have just recounted. It would be easy for me to fill many pages describing the influence of the Tuskegee graduates in every part of the South. We keep it constantly in the minds of our students and graduates that the industrial or material condition of the masses of our people must be improved, as well as the intellectual, before there can be any permanent change in their moral and religious life. We find it a pretty hard thing to make a good Christian of a hungry man. No matter how much our people "get happy" and "shout" in church, if they go home at night from church hungry, they are tempted to find something before morning. This is a principle of human nature, and is not confined to the negro.

The negro has within him immense power for self-uplifting, but for years it will be necessary to guide and stimulate him. The recognition of this power led us to organize, five years ago, what is now known as the Tuskegee Negro Conference,--a gathering that meets every February, and is composed of about eight hundred representative colored men and women from all sections of the Black Belt. They come in ox-carts, mule-carts, buggies, on muleback and horseback, on foot, by railroad: some traveling all night in order to be present. The matters considered at the conferences are those that the colored people have it within their own power to control: such as the evils of the mortgage system, the one-room cabin, buying on credit, the importance of owning a home and of putting money in the bank, how to build schoolhouses and prolong the school term, and how to improve their moral and religious condition.

As a single example of the results, one delegate reported that since the conferences were started five years ago eleven people in his neighborhood had bought homes, fourteen had got out of debt, and a number had stopped mortgaging their crops. Moreover, a schoolhouse had been built by the people themselves, and the school term had been extended from three to six months; and with a look of triumph he exclaimed, "We is done stopped libin' in de ashes!"

Besides this Negro Conference for the masses of the people, we now have a gathering at the same time known as the Workers' Conference, composed of the officers and instructors in the leading colored schools of the South. After listening to the story of the conditions and needs from the people themselves, the Workers' Conference finds much food for thought and discussion.

Nothing else so soon brings about right relations between the two races in the South as the industrial progress of the negro. Friction between the races will pass away in proportion as the black man, by reason of his skill, intelligence, and character, can produce something that the white man wants or respects in the commercial world. This is another reason why at Tuskegee we push the industrial training. We find that as every year we put into a Southern community colored men who can start a brick-yard, a sawmill, a tin-shop, or a printing-office,--men who produce something that makes the white man partly dependent upon the negro, instead of all the dependence being on the other side,--a change takes place in the relations of the races.

Let us go on for a few more years knitting our business and industrial relations into those of the white man, till a black man gets a mortgage on a white man's house that he can foreclose at will. The white man on whose house the mortgage rests will not try to prevent that negro from voting when he goes to the polls. It is through the dairy farm, the truck garden, the trades, and commercial life, largely, that the negro is to find his way to the enjoyment of all his rights. Whether he will or not, a white man respects a negro who owns a two-story brick house.

What is the permanent value of the Tuskegee system of training to the South in a broader sense? In connection with this, it is well to bear in mind that slavery taught the white man that labor with the hands was something fit for the negro only, and something for the white man to come into contact with just as little as possible. It is true that there was a large class of poor white people who labored with the hands, but they did it because they were not able to secure negroes to work for them; and these poor whites were constantly trying to imitate the slave-holding class in escaping labor, and they too regarded it as anything but elevating. The negro in turn looked down upon the poor whites with a certain contempt because they had to work. The negro, it is to be borne in mind, worked under constant protest, because he felt that his labor was being unjustly required, and he spent almost as much effort in planning how to escape work as in learning how to work. Labor with him was a badge of degradation. The white man was held up before him as the highest type of civilization, but the negro noted that this highest type of civilization himself did no labor; hence he argued that the less work he did, the more nearly he would be like a white man. Then, in addition to these influences, the slave system discouraged labor-saving machinery. To use labor-saving machinery intelligence was required, and intelligence and slavery were not on friendly terms; hence the negro always associated labor with toil, drudgery, something to be escaped. When the negro first became free, his idea of education was that it was something that would soon put him in the same position as regards work that his recent master had occupied. Out of these conditions grew the Southern habit of putting off till to-morrow and the day after the duty that should be done promptly to-day. The leaky house was not repaired while the sun shone, for then the rain did not come through. While the rain was falling, no one cared to expose himself to stop the leak. The plough, on the same principle, was left where the last furrow was run, to rot and rust in the field during the winter. There was no need to repair the wooden chimney that was exposed to the fire, because water could be thrown on it when it was on fire. There was no need to trouble about the payment of a debt to-day, for it could just as well be paid next week or next year. Besides these conditions, the whole South, at the close of the war, was without proper food, clothing, and shelter,--was in need of habits of thrift and economy and of something laid up for a rainy day.

To me it seemed perfectly plain that here was a condition of things that could not be met by the ordinary process of education. At Tuskegee we became convinced that the thing to do was to make a careful systematic study of the condition and needs of the South, especially the Black Belt, and to bend our efforts in the direction of meeting these needs, whether we were following a well-beaten track, or were hewing out a new path to meet conditions probably without a parallel in the world. After fourteen years of experience and observation, what is the result? Gradually but surely, we find that all through the South the disposition to look upon labor as a disgrace is on the wane, and the parents who themselves sought to escape work are so anxious to give their children training in intelligent labor that every institution which gives training in the handicrafts is crowded, and many (among them Tuskegee) have to refuse admission to hundreds of applicants. The influence of the Tuskegee system is shown again by the fact that almost every little school at the remotest cross-roads is anxious to be known as an industrial school, or, as some of the colored people call it, an "industrus" school.

The social lines that were once sharply drawn between those who labored with the hand and those who did not are disappearing. Those who formerly sought to escape labor, now when they see that brains and skill rob labor of the toil and drudgery once associated with it, instead of trying to avoid it are willing to pay to be taught how to engage in it. The South is beginning to see labor raised up, dignified and beautified, and in this sees its salvation. In proportion as the love of labor grows, the large idle class which has long been one of the curses of the South disappears. As its members become absorbed in occupations, they have less time to attend to everybody else's business, and more time for their own.

The South is still an undeveloped and unsettled country, and for the next half century and more the greater part of the energy of the masses will be needed to develop its material opportunities. Any force that brings the rank and file of the people to a greater love of industry is therefore especially valuable. This result industrial education is surely bringing about. It stimulates production and increases trade,--trade between the races,--and in this new and engrossing relation both forget the past. The white man respects the vote of the colored man who does $10,000 worth of business, and the more business the colored man has, the more careful he is how he votes.

Immediately after the war, there was a large class of Southern people who feared that the opening of the free schools to the freedmen and the poor whites--the education of the head alone--would result merely in increasing the class who sought to escape labor, and that the South would soon be overrun by the idle and vicious. But as the results of industrial combined with academic training begin to show themselves in hundreds of communities that have been lifted up through the medium of the Tuskegee system, these former prejudices against education are being removed. Many of those who a few years ago opposed general education are now among its warmest advocates.

This industrial training, emphasizing as it does the idea of economic production, is gradually bringing the South to the point where it is feeding itself. Before the war, and long after it, the South made what little profit was received from the cotton crop, and sent its earnings out of the South to purchase food supplies,--meat, bread, canned vegetables, and the like; but the improved methods of agriculture are fast changing this habit. With the newer methods of labor, which teach promptness and system, and emphasize the worth of the beautiful,--the moral value of the well-painted house, and the fence with every paling and nail in its place,--we are bringing to bear upon the South an influence that is making it a new country in industry, education, and religion.

THE STORY OF UNCLE TOM'S CABIN by Charles Dudley Warner

On the 29th of June, 1852, Henry Clay died. In that month the two great political parties, in their national conventions, had accepted as a finality all the compromise measures of 1850, and the last hours of the Kentucky statesman were brightened by the thought that his efforts had secured the perpetuity of the Union.

But on the 20th of March, 1852, there had been an event, the significance of which was not taken into account by the political conventions or by Clay, which was to test the conscience of the nation. This was the publication of Uncle Tom's Cabin. Was this only an "event," the advent of a new force in politics; was the book merely an abolition pamphlet, or was it a novel, one of the few great masterpieces of fiction that the world has produced? After the lapse of forty-four years and the disappearance of African slavery on this continent, it is perhaps possible to consider this question dispassionately.

The compromise of 1850 satisfied neither the North nor the South. The admission of California as a free State was regarded by Calhoun as fatal to the balance between the free and the slave States, and thereafter a fierce agitation sprang up for the recovery of this loss of balance, and ultimately for Southern preponderance, which resulted in the repeal of the Missouri Compromise, the Kansas-Nebraska war, and the civil war. The fugitive slave law was hateful to the North not only because it was cruel and degrading, but because it was seen to be a move formed for nationalizing slavery. It was unsatisfactory to the South because it was deemed inadequate in its provisions, and because the South did not believe the North would execute it in good faith. So unstable did the compromise seem that in less than a year after the passage of all its measures, Henry Clay and forty-four Senators and Representatives united in a manifesto declaring that they would support no man for office who was not known to be opposed to any disturbance of the settlements of the compromise. When, in February, 1851, the recaptured fugitive slave, Burns, was rescued from the United States officers in Boston, Clay urged the investment of the President with extraordinary power to enforce the law.

Henry Clay was a patriot, a typical American. The republic and its preservation were the passions of his life. Like Lincoln, who was born in the State of his adoption, he was willing to make almost any sacrifice for the maintenance of the Union. He had no sympathy with the system of slavery. There is no doubt that he would have been happy in the belief that it was in the way of gradual

and peaceful extinction. With him, it was always the Union before state rights and before slavery. Unlike Lincoln, he had not the clear vision to see that the republic could not endure half slave and half free. He believed that the South, appealing to the compromises of the Constitution, would sacrifice the Union before it would give up slavery, and in fear of this menace he begged the North to conquer its prejudices. We are not liable to overrate his influence as a compromising pacificator from 1832 to 1852. History will no doubt say that it was largely due to him that the war on the Union was postponed to a date when its success was impossible.

It was the fugitive slave law that brought the North face to face with slavery nationalized, and it was the fugitive slave law that produced Uncle Tom's Cabin. The effect of this story was immediate and electric. It went straight to the hearts of tens of thousands of people who had never before considered slavery except as a political institution for which they had no personal responsibility. What was this book, and how did it happen to produce such an effect? It is true that it struck into a time of great irritation and agitation, but in one sense there was nothing new in it. The facts had all been published. For twenty years abolition tracts, pamphlets, newspapers, and books had left little to be revealed, to those who cared to read, as to the nature of slavery or its economic aspects. The evidence was practically all in,--supplied largely by the advertisements of Southern newspapers and by the legislation of the slaveholding States,--but it did not carry conviction; that is, the sort of conviction that results in action. The subject had to be carried home to the conscience. Pamphleteering, convention-holding, sermons, had failed to do this. Even the degrading requirements of the fugitive slave law, which brought shame and humiliation, had not sufficed to fuse the public conscience, emphasize the necessity of obedience to the moral law, and compel recognition of the responsibility of the North for slavery. Evidence had not done this, passionate appeals had not done it, vituperation had not done it. What sort of presentation of the case would gain the public ear and go to the heart? If Mrs. Stowe, in all her fervor, had put forth first the facts in The Key to Uncle Tom's Cabin, which so buttressed her romance, the book would have had no more effect than had followed the like compilations and arraignments. What was needed? If we can discover this, we shall have the secret of this epoch-making novel.

The story of this book has often been told. It is in the nature of a dramatic incident of which the reader never tires any more than the son of Massachusetts does of the minutest details of that famous scene in the Senate Chamber when Webster replied to Hayne.

At the age of twenty-four the author was married and went to live in Cincinnati, where her husband held a chair in the Lane Theological Seminary. There for the first time she was brought into relations with the African race and saw the effects of slavery. She visited slaveholders in Kentucky and had friends among them. In some homes she saw the "patriarchal" institution at its best. The Beecher family were anti-slavery, but they had not been identified with the abolitionists, except perhaps Edward, who was associated with the murdered Lovejoy. It was long a reproach brought by the abolitionists against Henry Ward Beecher that he held entirely aloof from their movement. At Cincinnati, however, the personal aspects of the case were brought home to Mrs. Stowe. She learned the capacities and peculiarities of the negro race. They were her servants; she taught some of them; hunted fugitives applied to her; she ransomed some by her own efforts; every day there came to her knowledge stories of the hunger for freedom, of the ruthless separation of man and wife and mother and child, and of the heroic sufferings of those who ran away from the fearful doom of those "sold down South." These things crowded upon her mind and awoke her deepest compassion. But what could she do against all the laws, the political and commercial interests, the great public apathy? Relieve a case here and there, yes. But to dwell upon the gigantic evil, with no means of making head against it, was to invite insanity.

As late as 1850, when Professor Stowe was called to Bowdoin College, and the family removed to Brunswick, Maine, Mrs. Stowe had not felt impelled to the duty she afterwards undertook. "In fact, it was a sort of general impression upon her mind, as upon that of many humane people in those days, that the subject was so dark and painful a one, so involved in difficulty and obscurity, so utterly beyond human hope or help, that it was of no use to read, or think, or distress one's self about it." But when she reached New England the excitement over the fugitive slave law was at its height. There was a panic in Boston among the colored people settled there, who were daily fleeing to Canada. Every mail brought her pitiful letters from Boston, from Illinois, and elsewhere, of the terror and despair caused by the law. Still more was the impressed by the apathy of the Christian world at the North, and surely, she said, the people did not understand what the "system" was. Appeals were made to her, who had some personal knowledge of the subject, to take up her pen. The task seemed beyond her in every way. She was not strong, she was in the midst of heavy domestic cares, with a young infant, with pupils to whom she was giving daily lessons, and the limited income of the family required the strictest economy. The dependence was upon the small salary of Professor Stowe, and the few dollars she could earn by an occasional newspaper or magazine article. But the theme burned in her mind, and finally took this shape: at least she would write some sketches and show the Christian world what slavery really was, and what the system was that they were defending. She wanted to do this with entire fairness, showing all the mitigations of the "patriarchal" system, and all that individuals concerned in it

could do to alleviate its misery. While pondering this she came by chance, in a volume of an anti-slavery magazine, upon the authenticated account of the escape of a woman with her child on the ice across the Ohio River from Kentucky. She began to meditate. The faithful slave husband in Kentucky, who had refused to escape from a master who trusted him, when he was about to be sold "down river," came to her as a pattern of Uncle Tom, and the scenes of the story began to form themselves in her mind. "The first part of the book ever committed to writing [this is the statement of Mrs. Stowe] was the death of Uncle Tom. This scene presented itself almost as a tangible vision to her mind while sitting at the communion-table in the little church in Brunswick. She was perfectly overcome by it, and could scarcely restrain the convulsion of tears and sobbings that shook her frame. She hastened home and wrote it, and her husband being away, read it to her two sons of ten and twelve years of age. The little fellows broke out into convulsions of weeping, one of them saying through his sobs, 'Oh, mamma, slavery is the most cursed thing in the world!' From that time the story can less be said to have been composed by her than imposed upon her. Scenes, incidents, conversations rushed upon her with a vividness and importunity that would not be denied. The book insisted upon getting itself into being, and would take no denial."

When two or three chapters were written she wrote to her friend, Dr. Bailey, of Washington, the editor of The National Era, to which she had contributed, that she was planning a story that might run through several numbers of the Era. The story was at once applied for, and thereafter weekly installments were sent on regularly, in spite of all cares and distractions. The installments were mostly written during the morning, on a little desk in a corner of the dining-room of the cottage in Brunswick, subject to all the interruptions of house-keeping, her children bursting into the room continually with the importunity of childhood. But they did not break the spell or destroy her abstraction. With a smile and a word and a motion of the hand she would wave them off, and keep on in her magician's work. Long afterwards they recalled this, dimly understood at the time, and wondered at her power of concentration. Usually at night the chapters were read to the family, who followed the story with intense feeling. The narrative ran on for nine months, exciting great interest among the limited readers of the Era, and gaining sympathetic words from the anti-slavery people, but without making any wide impression on the public.

We may pause here in the narrative to note two things: the story was not the work of a novice, and it was written out of abundant experience and from an immense mass of accumulated thought and material. Mrs. Stowe was in her fortieth year. She had been using her pen since she was twelve years old, in extensive correspondence, in occasional essays, in short stories and sketches, some of which appeared in a volume called The Mayflower, published in 1843, and for many years her writing for newspapers and periodicals had added appreciably to the small family income. She was in the maturity of her intellectual powers, she was trained in the art of writing, and she had, as Walter Scott had when he began the Waverley Novels at the age of forty-three, abundant store of materials on which to draw. To be sure, she was on fire with a moral purpose, but she had the dramatic instinct, and she felt that her object would not be reached by writing an abolition tract.

"In shaping her material the author had but one purpose, to show the institution of slavery truly, just as it existed. She had visited in Kentucky; had formed the acquaintance of people who were just, upright, and generous, and yet slave-holders. She had heard their views, and appreciated their situation; she felt that justice required that their difficulties should be recognized and their virtues acknowledged. It was her object to show that the evils of slavery were the inherent evils of a bad system, and not always the fault of those who had become involved in it and were its actual administrators. Then she was convinced that the presentation of slavery alone, in its most dreadful forms, would be a picture of such unrelieved horror and darkness as nobody could be induced to look at. Of set purpose, she sought to light up the darkness by humorous and grotesque episodes, and the presentation of the milder and more amusing phases of slavery, for which her recollection of the never-failing wit and drollery of her former colored friends in Ohio gave her abundant material."

This is her own account of the process, years after. But it is evident that, whether consciously or unconsciously, she did but follow the inevitable law of all great dramatic creators and true story-tellers since literature began.

For this story Mrs. Stowe received from the Era the sum of three hundred dollars. Before it was finished it attracted the attention of Mr. J. P. Jewett, of Boston, a young and then unknown publisher, who offered to issue it in book form. His offer was accepted, but as the tale ran on he became alarmed at its length, and wrote to the author that she was making the story too long for a one-volume novel; that the subject was unpopular; that people would not willingly hear much about it; that one short volume might possibly sell, but that if it grew to two that might prove a fatal obstacle to its success. Mrs. Stowe replied that she did not make the story, that the story made itself, and that she could not stop it till it was done. The publisher hesitated. It is said that a competent literary critic to whom he submitted it sat up all night with the novel, and then reported, "The story has life in it; it will sell." Mr. Jewett proposed to Professor Stowe to publish it on half profits if he would share the expenses. This offer was declined, for the Stowes had no money

to advance, and the common royalty of ten per cent on the sales was accepted.

Mrs. Stowe was not interested in this business transaction. She was thinking only of having the book circulated for the effect she had at heart. The intense absorption in the story held her until the virtual end in the death of Uncle Tom, and then it seemed as if the whole vital force had left her. She sank into a profound discouragement. Would this appeal, which she had written with her heart's blood, go for nothing, as all the prayers and tears and strivings had already gone? When the last proof sheets left her hands, "it seemed to her that there was no hope; that nobody would read, nobody would pity; that this frightful system, which had already pursued its victims into the free States, might at last even threaten them in Canada." Resolved to leave nothing undone to attract attention to her cause, she wrote letters and ordered copies of her novel sent to men of prominence who had been known for their anti-slavery sympathies,--to Prince Albert, Macaulay, Charles Dickens, Charles Kingsley, and Lord Carlisle. Then she waited for the result.

She had not long to wait. The success of the book was immediate. Three thousand copies were sold the first day, within a few days ten thousand copies had gone, on the 1st of April a second edition went to press, and thereafter eight presses running day and night were barely able to keep pace with the demand for it. Within a year three hundred thousand copies were sold. No work of fiction ever spread more quickly throughout the reading community or awakened a greater amount of public feeling. It was read by everybody, learned and unlearned, high and low, for it was an appeal to universal human sympathy, and the kindling of this spread the book like wildfire. At first it seemed to go by acclamation. But this was not altogether owing to sympathy with the theme. I believe that it was its power as a novel that carried it largely. The community was generally apathetic when it was not hostile to any real effort to be rid of slavery. This presently appeared. At first there were few dissenting voices from the chorus of praise. But when the effect of the book began to be evident it met with an opposition fiercer and more personal than the great wave of affectionate thankfulness which greeted it at first. The South and the defenders and apologists of slavery everywhere were up in arms. It was denounced in pulpit and in press, and some of the severest things were said of it at the North. The leading religious newspaper of the country, published in New York, declared that it was "anti-Christian."

Mrs. Stowe was twice astonished: first by its extraordinary sale, and second by the quarter from which the assault on it came. She herself says that her expectations were strikingly different from the facts. "She had painted slaveholders as amiable, generous, and just. She had shown examples among them of the noblest and most beautiful traits of character; had admitted fully their temptations, their perplexities, and their difficulties, so that a friend of hers who had many relatives in the South wrote to her: 'Your book is going to be the great pacificator; it will unite both North and South.' Her expectation was that the professed abolitionists would denounce it as altogether too mild in its dealings with slaveholders. To her astonishment, it was the extreme abolitionists who received, and the entire South who rose up against it."

There is something almost amusing in Mrs. Stowe's honest expectation that the deadliest blow the system ever suffered should have been received thankfully by those whose traditions, education, and interests were all bound up in it. And yet from her point of view it was not altogether unreasonable. Her blackest villain and most loathsome agent of the system, Legree, was a native of Vermont. All her wrath falls upon the slave-traders, the auctioneers, the public whippers, and the overseers, and all these persons and classes were detested by the Southerners to the point of loathing, and were social outcasts. The slave-traders and the overseers were tolerated as perhaps necessary in the system, but they were never admitted into respectable society. This feeling Mrs. Stowe regarded as a condemnation of the system.

Pecuniary reward was the last thing that Mrs. Stowe expected for her disinterested labor, but it suits the world's notion of the fitness of things that this was not altogether wanting. For the millions of copies of Uncle Tom scattered over the world the author could expect nothing, but in her own country her copyright yielded her a moderate return that lifted her out of poverty and enabled her to pursue her philanthropic and literary career. Four months after the publication of the book Professor Stowe was in the publisher's office, and Mr. Jewett asked him how much he expected to receive. "I hope," said Professor Stowe, with a whimsical smile, "that it will be enough to buy my wife a silk dress." The publisher handed him a check for ten thousand dollars.

Before Mrs. Stowe had a response to the letters accompanying the books privately sent to England, the novel was getting known there. Its career in Great Britain paralleled its success in America. In April a copy reached London in the hands of a gentleman who had taken it on the steamer to read. He gave it to Mr. Henry Vizetelly, who submitted it to Mr. David Bogue, a man known for his shrewdness and enterprise. He took a night to consider it, and then declined it, although it was offered to him for five pounds. A Mr. Gilpin also declined it. It was then submitted to Mr. Salisbury, a printer. This taster for the public sat up with the book till four o'clock in the morning, alternately weeping and laughing. Fearing, however, that this result was due to his own weakness, he woke up his

wife, whom he describes as a rather strong-minded woman, and finding that the story kept her awake and made her also laugh and cry, he thought it might safely be printed. It seems, therefore, that Mr. Vizetelly ventured to risk five pounds, and the volume was brought out through the nominal agency of Clarke & Company. In the first week an edition of seven thousand was worked off. It made no great stir until the middle of June, but during July it sold at the rate of one thousand a week. By the 20th of August the demand for it was overwhelming. The printing firm was then employing four hundred people in getting it out, and seventeen printing-machines, besides hand-presses. Already one hundred and fifty thousand copies were sold. Mr. Vizetelly disposed of his interest, and a new printing firm began to issue monster editions. About this time the publishers awoke to the fact that any one was at liberty to reprint the book, and the era of cheap literature was initiated, founded on American reprints which cost the publisher no royalty. A shilling edition followed the one-and-sixpence, and then one complete for sixpence. As to the total sale, Mr. Sampson Low reports: "From April to December, 1852, twelve different editions (not reissues) were published, and within the twelve months of its first appearance eighteen different London publishing houses were engaged in supplying the great demand that had set in, the total number of editions being forty, varying from fine illustrated editions at 15s., 10s., and 7s. 6d. to the cheap popular editions of 1s. 9d. and 6d. After carefully analyzing these editions and weighing probabilities with ascertained facts, I am able pretty confidently to say that the aggregate number of copies circulated in Great Britain and the colonies exceeds one and a half millions." Later, abridgments were published.

Almost simultaneously with this furor in England the book made its way on the Continent. Several translations appeared in Germany and France, and for the authorized French edition Mrs. Stowe wrote a new preface, which served thereafter for most of the European editions. I find no record of the order of the translations of the book into foreign languages, but those into some of the Oriental tongues did not appear till several years after the great excitement. The ascertained translations are into twenty-three tongues, namely: Arabic, Armenian, Chinese, Danish, Dutch, Finnish, Flemish, French, German, Hungarian, Illyrian, Italian, Japanese, Polish, Portuguese, modern Greek, Russian, Servian, Siamese, Spanish, Swedish, Wallachian, and Welsh. Into some of these languages several translations were made. In 1878 the British Museum contained thirty-five editions of the original text, and eight editions of abridgments or adaptations.

The story was dramatized in the United States in August, 1852, without the consent or knowledge of the author, and was played most successfully in the leading cities, and subsequently was acted in every capital in Europe. Mrs. Stowe had neglected to secure the dramatic rights, and she derived no benefit from the great popularity of a drama which still holds the stage. From the phenomenal sale of a book which was literally read by the whole world, the author received only the ten per cent on the American editions, and by the laws of her own country her copyright expired before her death.

The narrative of the rise and fortunes of this book would be incomplete without some reference to the response that the author received from England and the Continent, and of her triumphant progress through the British Isles. Her letters accompanying the special copies were almost immediately replied to, generally in terms of enthusiastic and fervent thankfulness for the book, and before midsummer her mail contained letters from all classes of English society. In some of them appeared a curious evidence of the English sensitiveness to criticism. Lord Carlisle and Sir Arthur Helps supplemented their admiration by a protest against the remark in the mouth of one of the characters that "slaves are better off than a large class of the population of England." This occurred in the defense of the institution by St. Clare, but it was treated by the British correspondents as the opinion of Mrs. Stowe. The charge was disposed of in Mrs. Stowe's reply: "The remark on that subject occurs in the dramatic part of the book, in the mouth of an intelligent Southerner. As a fair-minded person, bound to state for both sides all that could be said, in the person of St. Clare, the best that could be said on that point, and what I know IS in fact constantly reiterated, namely, that the laboring class of the South are in many respects, as to physical comfort, in a better condition than the poor in England. This is the slaveholder's stereo-typed apology; a defense it cannot be, unless two wrongs make one right."

In April, 1853, Mr. and Mrs. Stowe and the latter's brother, Charles Beecher, sailed for Europe. Her reception there was like a royal progress. She was met everywhere by deputations and addresses, and the enthusiasm her presence called forth was thoroughly democratic, extending from the highest in rank to the lowest. At Edinburgh there was presented to her a national penny offering, consisting of a thousand golden sovereigns on a magnificent silver salver, an unsolicited contribution in small sums by the people.

At a reception in Stafford House, London, the Duchess of Sutherland presented her with a massive gold bracelet, which has an interesting history. It is made of ten oval links in imitation of slave fetters. On two of the links were the inscriptions "March 25, 1807," the date of the abolition of the slave-trade, and "August 1, 1838," the date of the abolition of slavery in all British territory. The third inscription is "562,848--March 19, 1853," the date of the address of the women of England to the women of America on slavery,

and the number of the women who signed. It was Mrs. Stowe's privilege to add to these inscriptions the following: "Emancipation D. C. Apl. 16, '62;" "President's Proclamation Jan. 1, '63;" "Maryland free Oct. 13, '64;" "Missouri free Jan. 11, '65;" and on the clasp link, "Constitution amended by Congress Jan. 31, '65. Constitutional Amendment ratified." Two of the links are vacant. What will the progress of civilization in America offer for the links nine and ten?

One of the most remarkable documents which resulted from Uncle Tom was an address from the women of England to the women of America, acknowledging the complicity in slavery of England, but praying aid in removing from the world "our common crimes and common dishonor," which was presented to Mrs. Stowe in 1853. It was the result of a meeting at Stafford House, and the address, composed by Lord Shaftesbury, was put into the hands of canvassers in England and on the Continent, and as far as Jerusalem. The signatures of 562,848 women were obtained, with their occupations and residences, from the nobility on the steps of the throne down to maids in the kitchen. The address is handsomely engrossed on vellum. The names are contained in twenty-six massive volumes, each fourteen inches high by nine in breadth and three inches thick, inclosed in an oak case. It is believed that this is the most numerously signed address in existence. The value of the address, with so many names collected in haphazard fashion, was much questioned, but its use was apparent in the height of the civil war, when Mrs. Stowe replied to it in one of the most vigorous and noble appeals that ever came from her pen. This powerful reply made a profound impression in England.

This is in brief the story of the book. It is still read, and read the world over, with tears and with laughter; it is still played to excited audiences. Is it a great novel, or was it only an event of an era of agitation and passion? Has it the real dramatic quality--the poet's visualizing of human life--that makes works of fiction, of imagination, live? Till recently, I had not read the book since 1852. I feared to renew acquaintance with it lest I should find only the shell of an exploded cartridge. I took it up at the beginning of a three-hours' railway journey. To my surprise the journey did not seem to last half an hour, and half the time I could not keep back the tears from my eyes. A London critic, full of sympathy with Mrs. Stowe and her work, recently said, "Yet she was not an artist, she was not a great woman." What is greatness? What is art? In 1862 probably no one who knew General Grant would have called him a great man. But he took Vicksburg. This woman did something with her pen,--on the whole, the most remarkable and effective book in her generation. How did she do it? Without art? George Sand said, "In matters of art there is but one rule, to paint and to move. And where shall we find conditions more complete, types more vivid, situations more touching, more original, than in Uncle Tom?" If there is not room in our art for such a book, I think we shall have to stretch our art a little. "Women, too, are here judged and painted with a master hand." This subtle critic, in her overpoweringly tender and enthusiastic review, had already inquired about the capacity of this writer. "Mrs. Stowe is all instinct; it is the very reason that she appears to some not to have talent. Has she not talent? What is talent? Nothing, doubtless, compared to genius; but has she genius? I cannot say that she has talent as one understands it in the world of letters, but she has genius as humanity feels the need of genius,--the genius of goodness, not that of the man of letters, but of the saint." It is admitted that Mrs. Stowe was not a woman of letters in the common acceptation of that term, and it is plain that in the French tribunal, where form is of the substance of the achievement, and which reluctantly overlooked the crudeness of Walter Scott, in France where the best English novel seems a violation of established canons, Uncle Tom would seem to belong where some modern critics place it, with works of the heart, and not of the head. The reviewer is, however, candid: "For a long time we have striven in France against the prolix explanations of Walter Scott. We have cried out against those of Balzac, but on consideration have perceived that the painter of manners and character has never done too much, that every stroke of the pencil was needed for the general effect. Let us learn then to appreciate all kinds of treatment, where the effect is good, and where they bear the seal of a master hand."

It must be admitted to the art critic that the book is defective according to the rules of the modern French romance; that Mrs. Stowe was possessed by her subject, and let her fervid interest in it be felt; that she had a definite purpose. That purpose was to quicken the sense of responsibility of the North by showing the real character of slavery, and to touch the South by showing that the inevitable wrong of it lay in the system rather than in those involved in it. Abundant material was in her hands, and the author burned to make it serviceable. What should she do? She might have done what she did afterwards in The Key, presented to the public a mass of statistics, of legal documents. The evidence would have been unanswerable, but the jury might not have been moved by it; they would have balanced it by considerations of political and commercial expediency. I presume that Mrs. Stowe made no calculation of this kind. She felt her course, and went on in it. What would an artist have done, animated by her purpose and with her material? He would have done what Cervantes did, what Tourgenieff did, what Mrs. Stowe did. He would have dramatized his facts in living personalities, in effective scenes, in vivid pictures of life. Mrs. Stowe exhibited the system of slavery by a succession of dramatized pictures, not always artistically welded together, but always effective as an exhibition of the system. Cervantes also showed a fading feudal romantic condition by a series of amusing and pathetic adventures, grouped rather loosely

about a singularly fascinating figure.

Tourgenieff, a more consummate artist, in his hunting scenes exhibited the effect of serfdom upon society, in a series of scenes with no necessary central figure, without comment, and with absolute concealment of any motive. I believe the three writers followed their instincts, without an analytic argument as to the method, as the great painter follows his when he puts an idea upon canvas. He may invent a theory about it afterwards; if he does not, some one else will invent it for him. There are degrees of art. One painter will put in unnecessary accessories, another will exhibit his sympathy too openly, the technique or the composition of another can be criticised. But the question is, is the picture great and effective?

Mrs. Stowe had not Tourgenieff's artistic calmness. Her mind was fused into a white heat with her message. Yet, how did she begin her story? Like an artist, by a highly dramatized scene, in which the actors, by a few strokes of the pen, appear as distinct and unmistakable personalities, marked by individual peculiarities of manner, speech, motive, character, living persons in natural attitudes. The reader becomes interested in a shrewd study of human nature, of a section of life, with its various refinement, coarseness, fastidiousness and vulgarity, its humor and pathos. As he goes on he discovers that every character has been perfectly visualized, accurately limned from the first; that a type has been created which remains consistent, which is never deflected from its integrity by any exigencies of plot. This clear conception of character (not of earmarks and peculiarities adopted as labels), and faithful adhesion to it in all vicissitudes, is one of the rarest and highest attributes of genius. All the chief characters in the book follow this line of absolutely consistent development, from Uncle Tom and Legree down to the most aggravating and contemptible of all, Marie St. Clare. The selfish and hysterical woman has never been so faithfully depicted by any other author.

Distinguished as the novel is by its character-drawing and its pathos, I doubt if it would have captivated the world without its humor. This is of the old-fashioned kind, the large humor of Scott, and again of Cervantes, not verbal pleasantry, not the felicities of Lamb, but the humor of character in action, of situations elaborated with great freedom, and with what may be called a hilarious conception. This quality is never wanting in the book, either for the reader's entertainment by the way, or to heighten the pathos of the narrative by contrast. The introduction of Topsy into the New Orleans household saves us in the dangerous approach to melodrama in the religious passages between Tom and St. Clare. Considering the opportunities of the subject, the book has very little melodrama; one is apt to hear low music on the entrance of little Eva, but we are convinced of the wholesome sanity of the sweet child. And it is to be remarked that some of the most exciting episodes, such as that of Eliza crossing the Ohio River on the floating ice (of which Mr. Ruskin did not approve), are based upon authentic occurrences. The want of unity in construction of which the critics complain is partially explained by the necessity of exhibiting the effect of slavery in its entirety. The parallel plots, one running to Louisiana and the other to Canada, are tied together by this consideration, and not by any real necessity to each other.

There is no doubt that Mrs. Stowe was wholly possessed by her theme, rapt away like a prophet in a vision, and that, in her feeling at the time, it was written through her quite as much as by her. This idea grew upon her mind in the retrospective light of the tremendous stir the story made in the world, so that in her later years she came to regard herself as a providential instrument, and frankly to declare that she did not write the book; "God wrote it." In her own account, when she reached the death of Uncle Tom, "the whole vital force left her." The inspiration there left her, and the end of the story, the weaving together of all the loose ends of the plot, in the joining together almost by miracle the long separated, and the discovery of the relationships, is the conscious invention of the novelist.

It would be perhaps going beyond the province of the critic to remark upon what the author considered the central power of the story, and its power to move the world, the faith of Uncle Tom in the Bible. This appeal to the emotion of millions of readers cannot, however, be overlooked. Many regard the book as effective in regions remote from our perplexities by reason of this grace. When the work was translated into Siamese, the perusal of it by one of the ladies of the court induced her to liberate all her slaves, men, women, and children, one hundred and thirty in all. "Hidden Perfume," for that was the English equivalent of her name, said she was wishful to be good like Harriet Beecher Stowe. And as to the standpoint of Uncle Tom and the Bible, nothing more significant can be cited than this passage from one of the latest writings of Heinrich Heine:--

"The reawakening of my religious feelings I owe to that holy book the Bible. Astonishing that after I have whirled about all my life over all the dance-floors of philosophy, and yielded myself to all the orgies of the intellect, and paid my addresses to all possible systems, without satisfaction like Messalina after a licentious night, I now find myself on the same standpoint where poor Uncle Tom stands,--on that of the Bible! I kneel down by my black brother in the same prayer! What a humiliation! With all my science I have come no further than the poor ignorant negro who has scarce learned to spell. Poor Tom, indeed, seems to have seen deeper things in the holy book than I.... Tom, perhaps, understands them better than I, because more flogging occurs in them; that is to

say, those ceaseless blows of the whip which have aesthetically disgusted me in reading the Gospels and the Acts. But a poor negro slave reads with his back, and understands better than we do. But I, who used to make citations from Homer, now begin to quote the Bible as Uncle Tom does."

The one indispensable requisite of a great work of imaginative fiction is its universality, its conception and construction so that it will appeal to universal human nature in all races and situations and climates. Uncle Tom's Cabin does that. Considering certain artistic deficiencies, which the French writers perceived, we might say that it was the timeliness of its theme that gave it currency in England and America. But that argument falls before the world-wide interest in it as a mere story, in so many languages, by races unaffected by our own relation to slavery.

It was the opinion of James Russell Lowell that the anti-slavery element in Uncle Tom and Dred stood in the way of a full appreciation, at least in her own country, of the remarkable genius of Mrs. Stowe. Writing in 1859, he said, "From my habits and the tendency of my studies I cannot help looking at things purely from an aesthetic point of view, and what I valued in Uncle Tom was the genius, and not the moral." This had been his impression when he read the book in Paris, long after the whirl of excitement produced by its publication had subsided, and far removed by distance from local influences. Subsequently, in a review, he wrote, "We felt then, and we believe now, that the secret of Mrs. Stowe's power lay in that same genius by which the great successes in creative literature have always been achieved,--the genius that instinctively goes to the organic elements of human nature, whether under a white skin or a black, and which disregards as trivial the conventions and fictitious notions which make so large a part both of our thinking and feeling.... The creative faculty of Mrs. Stowe, like that of Cervantes in Don Quixote and of Fielding in Joseph Andrews, overpowered the narrow specialty of her design, and expanded a local and temporary theme with the cosmopolitanism of genius."

A half-century is not much in the life of a people; it is in time an inadequate test of the staying power of a book. Nothing is more futile than prophecy on contemporary literary work. It is safe, however, to say that Uncle Tom's Cabin has the fundamental qualities, the sure insight into human nature, and the fidelity to the facts of its own time which have from age to age preserved works of genius.

STRIVINGS OF THE NEGRO PEOPLE by W. E. Burghardt Du Bois

Berween me and the other world there is ever an unasked question: unasked by some through feelings of delicacy; by others through the difficulty of rightly framing it. All, nevertheless, flutter round it. They approach me in a half-hesitant sort of way, eye me curiously or compassionately, and then, instead of saying directly, How does it feel to be a problem? they say, I know an excellent colored man in my town; or, I fought at Mechanicsville; or, Do not these Southern outrages make your blood boil? At these I smile, or am interested, or reduce the boiling to a simmer, as the occasion may require. To the real question, How does it feel to be a problem? I answer seldom a word.

And yet, being a problem is a strange experience,--peculiar even for one who has never been anything else, save perhaps in babyhood and in Europe. It is in the early days of rollicking boyhood that the revelation first bursts upon one, all in a day, as it were. I remember well when the shadow swept across me. I was a little thing, away up in the hills of New England, where the dark Housatonic winds between Hoosac and Taghanic to the sea. In a wee wooden schoolhouse, something put it into the boys' and girls' heads to buy gorgeous visiting-cards--ten cents a package--and exchange. The exchange was merry, till one girl, a tall newcomer, refused my card,--refused it peremptorily, with a glance. Then it dawned upon me with a certain suddenness that I was different from the others; or like, mayhap, in heart and life and longing, but shut out from their world by a vast veil. I had thereafter no desire to tear down that veil, to creep through; I held all beyond it in common contempt, and lived above it in a region of blue sky and great wandering shadows. That sky was bluest when I could beat my mates at examination-time, or beat them at a foot-race, or even beat their stringy heads. Alas, with the years all this fine contempt began to fade; for the world I longed for, and all its dazzling opportunities, were theirs, not mine. But they should not keep these prizes, I said; some, all, I would wrest from them. Just how I would do it I could never decide: by reading law, by healing the sick, by telling the wonderful tales that swam in my head,--some way. With other black boys the strife was not so fiercely sunny: their youth shrunk into tasteless sycophancy, or into silent hatred of the pale world about them and mocking distrust of everything white; or wasted itself in a bitter cry. Why did God make me an outcast and a stranger in mine own house? The "shades of the prison-house" closed round about us all: walls strait and stubborn to the whitest, but relentlessly narrow, tall, and unscalable to sons of night who must plod darkly on in resignation, or beat unavailing palms against the stone, or steadily, half hopelessly watch the streak of blue above.

After the Egyptian and Indian, the Greek and Roman, the Teuton and Mongolian, the Negro is a sort of seventh son, born with a veil, and gifted with second-sight in this American world,--a world which yields him no self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity. One ever feels his two-ness,--an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder. The history of the American Negro is the history of this strife,--this longing to attain self-conscious manhood, to merge his double self into a better and truer self. In this merging he wishes neither of the older selves to be lost. He does not wish to Africanize America, for America has too much to teach the world and Africa; he does not wish to bleach his Negro blood in a flood of white Americanism, for he believes--foolishly, perhaps, but fervently--that Negro blood has yet a message for the world. He simply wishes to make it possible for a man to be both a Negro and an American without being cursed and spit upon by his fellows, without losing the opportunity of self-development.

This is the end of his striving: to be a co-worker in the kingdom of culture, to escape both death and isolation, and to husband and use his best powers. These powers, of body and of mind, have in the past been so wasted and dispersed as to lose all effectiveness, and to seem like absence of all power, like weakness. The double-aimed struggle of the black artisan, on the one hand to escape white contempt for a nation of mere hewers of wood and drawers of water, and on the other hand to plough and nail and dig for a poverty-stricken horde, could only result in making him a poor craftsman, for he had but half a heart in either cause. By the poverty and ignorance of his people the Negro lawyer or doctor was pushed toward quackery and demagogism, and by the criticism of the other world toward an elaborate preparation that overfitted him for his lowly tasks. The would-be black savant was confronted by the paradox that the knowledge his people needed was a twice-told tale to his white neighbors, while the knowledge which would teach the white world was Greek to his own flesh and blood. The innate love of harmony and beauty that set the ruder souls of his people a-dancing, a-singing, and a-laughing raised but confusion and doubt in the soul of the black artist; for the beauty revealed to him was the soul-beauty of a race which his larger audience despised, and he could not articulate the message of another people.

This waste of double aims, this seeking to satisfy two unreconciled ideals, has wrought sad havoc with the courage and faith and deeds of eight thousand thousand people, has sent them often wooing false gods and invoking false means of salvation, and has even at times seemed destined to make them ashamed of themselves. In the days of bondage they thought to see in one divine event the end of all doubt and disappointment; eighteenth-century Rousseauism never worshiped freedom with half the unquestioning faith that the American Negro did for two centuries. To him slavery was, indeed, the sum of all villainies, the cause of all sorrow, the root of all prejudice; emancipation was the key to a promised land of sweeter beauty than ever stretched before the eyes of wearied Israelites. In his songs and exhortations swelled one refrain, liberty; in his tears and curses the god he implored had freedom in his right hand. At last it came,--suddenly, fearfully, like a dream. With one wild carnival of blood and passion came the message in his own plaintive cadences:--

"Shout, O children! Shout, you're free! The Lord has bought your liberty!"

Years have passed away, ten, twenty, thirty. Thirty years of national life, thirty years of renewal and development, and yet the swarthy ghost of Banquo sits in its old place at the national feast. In vain does the nation cry to its vastest problem,--

"Take any shape but that, and my firm nerves Shall never tremble!"

The freedman has not yet found in freedom his promised land. Whatever of lesser good may have come in these years of change, the shadow of a deep disappointment rests upon the Negro people,--a disappointment all the more bitter because the unattained ideal was unbounded save by the simple ignorance of a lowly folk.

The first decade was merely a prolongation of the vain search for freedom, the boom that seemed ever barely to elude their grasp,--like a tantalizing will-o'-the-wisp, maddening and misleading the headless host. The holocaust of war, the terrors of the Kuklux Klan, the lies of carpet-baggers, the disorganization of industry, and the contradictory advice of friends and foes left the bewildered serf with no new watchword beyond the old cry for freedom. As the decade closed, however, he began to grasp a new idea. The ideal of liberty demanded for its attainment powerful means, and these the Fifteenth Amendment gave him. The ballot, which before he had looked upon as a visible sign of freedom, he now regarded as the chief means of gaining and perfecting the liberty with which war had partially endowed him. And why not? Had not votes made war and emancipated millions? Had not votes enfranchised the freedmen? Was anything impossible to a power that had done all this? A million black men started with renewed

zeal to vote themselves into the kingdom. The decade fled away,--a decade containing, to the freedman's mind, nothing but suppressed votes, stuffed ballot-boxes, and election outrages that nullified his vaunted right of suffrage. And yet that decade from 1875 to 1885 held another powerful movement, the rise of another ideal to guide the unguided, another pillar of fire by night after a clouded day. It was the ideal of "book-learning;" the curiosity, born of compulsory ignorance, to know and test the power of the cabalistic letters of the white man, the longing to know. Mission and night schools began in the smoke of battle, ran the gauntlet of reconstruction, and at last developed into permanent foundations. Here at last seemed to have been discovered the mountain path to Canaan; longer than the highway of emancipation and law, steep and rugged, but straight, leading to heights high enough to overlook life.

Up the new path the advance guard toiled, slowly, heavily, doggedly; only those who have watched and guided the faltering feet, the misty minds, the dull understandings of the dark pupils of these schools know how faithfully, how piteously, this people strove to learn. It was weary work. The cold statistician wrote down the inches of progress here and there, noted also where here and there a foot had slipped or some one had fallen. To the tired climbers, the horizon was ever dark, the mists were often cold, the Canaan was always dim and far away. If, however, the vistas disclosed as yet no goal, no resting-place, little but flattery and criticism, the journey at least gave leisure for reflection and self-examination; it changed the child of emancipation to the youth with dawning self-consciousness, self-realization, self-respect. In those sombre forests of his striving his own soul rose before him, and he saw himself,--darkly as through a veil; and yet he saw in himself some faint revelation of his power, of his mission. He began to have a dim feeling that, to attain his place in the world, he must be himself, and not another. For the first time he sought to analyze the burden he bore upon his back, that dead-weight of social degradation partially masked behind a half-named Negro problem. He felt his poverty; without a cent, without a home, without land, tools, or savings, he had entered into competition with rich, landed, skilled neighbors. To be a poor man is hard, but to be a poor race in a land of dollars is the very bottom of hardships. He felt the weight of his ignorance,--not simply of letters, but of life, of business, of the humanities; the accumulated sloth and shirking and awkwardness of decades and centuries shackled his hands and feet. Nor was his burden all poverty and ignorance. The red stain of bastardy, which two centuries of systematic legal defilement of Negro women had stamped upon his race, meant not only the loss of ancient African chastity, but also the hereditary weight of a mass of filth from white whoremongers and adulterers, threatening almost the obliteration of the Negro home.

A people thus handicapped ought not to be asked to race with the world, but rather allowed to give all its time and thought to its own social problems. But alas! while sociologists gleefully count his bastards and his prostitutes, the very soul of the toiling, sweating black man is darkened by the shadow of a vast despair. Men call the shadow prejudice, and learnedly explain it as the natural defense of culture against barbarism, learning against ignorance, purity against crime, the "higher" against the "lower" races. To which the Negro cries Amen! and swears that to so much of this strange prejudice as is founded on just homage to civilization, culture, righteousness, and progress he humbly bows and meekly does obeisance. But before that nameless prejudice that leaps beyond all this he stands helpless, dismayed, and well-nigh speechless; before that personal disrespect and mockery, the ridicule and systematic humiliation, the distortion of fact and wanton license of fancy, the cynical ignoring of the better and boisterous welcoming of the worse, the all-pervading desire to inculcate disdain for everything black, from Toussaint to the devil,--before this there rises a sickening despair that would disarm and discourage any nation save that black host to whom "discouragement" is an unwritten word.

They still press on, they still nurse the dogged hope,--not a hope of nauseating patronage, not a hope of reception into charmed social circles of stock-jobbers, pork-packers, and earl-hunters, but the hope of a higher synthesis of civilization and humanity, a true progress, with which the chorus

"Peace, good will to men," "May make one music as before, But vaster."

Thus the second decade of the American Negro's freedom was a period of conflict, of inspiration and doubt, of faith and vain questionings, of Sturm and Drang. The ideals of physical freedom, of political power, of school training, as separate all-sufficient panaceas for social ills, became in the third decade dim and overcast. They were the vain dreams of credulous race childhood; not wrong, but incomplete and over-simple. The training of the schools we need to-day more than ever,--the training of deft hands, quick eyes and ears, and the broader, deeper, higher culture of gifted minds. The power of the ballot we need in sheer self-defense, and as a guarantee of good faith. We may misuse it, but we can scarce do worse in this respect than our whilom masters. Freedom, too, the long-sought, we still seek,--the freedom of life and limb, the freedom to work and think. Work, culture, and liberty,--all these we need, not singly, but together; for to-day these ideals among the Negro people are gradually coalescing,

and finding a higher meaning in the unifying ideal of race,--the ideal of fostering the traits and talents of the Negro, not in opposition to, but in conformity with, the greater ideals of the American republic, in order that some day, on American soil, two world races may give each to each those characteristics which both so sadly lack. Already we come not altogether empty-handed: there is to-day no true American music but the sweet wild melodies of the Negro slave; the American fairy tales are Indian and African; we are the sole oasis of simple faith and reverence in a dusty desert of dollars and smartness. Will America be poorer if she replace her brutal, dyspeptic blundering with the light-hearted but determined Negro humility; or her coarse, cruel wit with loving, jovial good humor; or her Annie Rooney with Steal Away?

Merely a stern concrete test of the underlying principles of the great republic is the Negro problem, and the spiritual striving of the freedmen's sons is the travail of souls whose burden is almost beyond the measure of their strength, but who bear it in the name of an historic race, in the name of this land of their fathers' fathers, and in the name of human opportunity.

THE WIFE OF HIS YOUTH by Charles W. Chesnutt

I.

Mr. Ryder was going to give a ball. There were several reasons why this was an opportune time for such an event.

Mr. Ryder might aptly be called the dean of the Blue Veins. The original Blue Veins were a little society of colored persons organized in a certain Northern city shortly after the war. Its purpose was to establish and maintain correct social standards among a people whose social condition presented almost unlimited room for improvement. By accident, combined perhaps with some natural affinity, the society consisted of individuals who were, generally speaking, more white than black. Some envious outsider made the suggestion that no one was eligible for membership who was not white enough to show blue veins. The suggestion was readily adopted by those who were not of the favored few, and since that time the society, though possessing a longer and more pretentious name, had been known far and wide as the "Blue Vein Society," and its members as the "Blue Veins."

The Blue Veins did not allow that any such requirement existed for admission to their circle, but, on the contrary, declared that character and culture were the only things considered; and that if most of their members were light-colored, it was because such persons, as a rule, had had better opportunities to qualify themselves for membership. Opinions differed, too, as to the usefulness of the society. There were those who had been known to assail it violently as a glaring example of the very prejudice from which the colored race had suffered most; and later, when such critics had succeeded in getting on the inside, they had been heard to maintain with zeal and earnestness that the society was a life-boat, an anchor, a bulwark and a shield, a pillar of cloud by day and of fire by night, to guide their people through the social wilderness. Another alleged prerequisite for Blue Vein membership was that of free birth; and while there was really no such requirement, it is doubtless true that very few of the members would have been unable to meet it if there had been. If there were one or two of the older members who had come up from the South and from slavery, their history presented enough romantic circumstances to rob their servile origin of its grosser aspects. While there were no such tests of eligibility, it is true that the Blue Veins had their notions on these subjects, and that not all of them were equally liberal in regard to the things they collectively disclaimed. Mr. Ryder was one of the most conservative. Though he had not been among the founders of the society, but had come in some years later, his genius for social leadership was such that he had speedily become its recognized adviser and head, the custodian of its standards, and the preserver of its traditions. He shaped its social policy, was active in providing for its entertainment, and when the interest fell off, as it sometimes did, he fanned the embers until they burst again into a cheerful flame. There were still other reasons for his popularity. While he was not as white as some of the Blue Veins, his appearance was such as to confer distinction upon them. His features were of a refined type, his hair was almost straight; he was always neatly dressed; his manners were irreproachable, and his morals above suspicion. He had come to Groveland a young man, and obtaining employment in the office of a railroad company as messenger had in time worked himself up to the position of stationery clerk, having charge of the distribution of the office supplies for the whole company. Although the lack of early training had hindered the orderly development of a naturally fine mind, it had not prevented him from doing a great deal of reading or from forming decidedly literary tastes. Poetry was his passion. He could repeat whole pages of the great English poets; and if his pronunciation was sometimes faulty, his eye, his voice, his gestures, would respond to the changing sentiment with a precision that revealed a poetic soul, and disarm criticism. He was economical, and had saved money; he owned and occupied a very comfortable house on a respectable street. His residence was handsomely furnished, containing among other things a good library, especially rich in poetry, a piano, and some choice engravings. He generally shared his house with some young couple, who looked after his wants and were company for him; for Mr. Ryder was a single man. In the early days of his connection with the

Blue Veins he had been regarded as quite a catch, and ladies and their mothers had manoeuvred with much ingenuity to capture him. Not, however, until Mrs. Molly Dixon visited Groveland had any woman ever made him wish to change his condition to that of a married man.

Mrs. Dixon had come to Groveland from Washington in the spring, and before the summer was over she had won Mr. Ryder's heart. She possessed many attractive qualities. She was much younger than he; in fact, he was old enough to have been her father, though no one knew exactly how old he was. She was whiter than he, and better educated. She had moved in the best colored society of the country, at Washington, and had taught in the schools of that city. Such a superior person had been eagerly welcomed to the Blue Vein Society, and had taken a leading part in its activities. Mr. Ryder had at first been attracted by her charms of person, for she was very good looking and not over twenty-five; then by her refined manners and by the vivacity of her wit. Her husband had been a government clerk, and at his death had left a considerable life insurance. She was visiting friends in Groveland, and, finding the town and the people to her liking, had prolonged her stay indefinitely. She had not seemed displeased at Mr. Ryder's attentions, but on the contrary had given him every proper encouragement; indeed, a younger and less cautious man would long since have spoken. But he had made up his mind, and had only to determine the time when he would ask her to be his wife. He decided to give a ball in her honor, and at some time during the evening of the ball to offer her his heart and hand. He had no special fears about the outcotme, but, with a little touch of romance, he wanted the surroundings to be in harmony with his own feelings when he should have received the answer he expected.

Mr. Ryder resolved that this ball should mark an epoch in the social history of Groveland. He knew, of course,--no one could know better,--the entertainments that had taken place in past years, and what must be done to surpass them. His ball must be worthy of the lady in whose honor it was to be given, and must, by the quality of its guests, set an example for the future. He had observed of late a growing liberality, almost a laxity, in social matters, even among members of his own set, and had several times been forced to meet in a social way persons whose complexions and callings in life were hardly up to the standard which he considered proper for the society to maintain. He had a theory of his own.

"I have no race prejudice," he would say, "but we people of mixed blood are ground between the upper and the nether millstone. Our fate lies between absorption by the white race and extinction in the black. The one doesn't want us yet, but may take us in time. The other would welcome us, but it would be for us a backward step. 'With malice towards none, with charity for all,' we must do the best we can for ourselves and those who are to follow us. Self-preservation is the first law of nature."

His ball would serve by its exclusiveness to counteract leveling tendencies, and his marriage with Mrs. Dixon would help to further the upward process of absorption he had been wishing and waiting for.

II.

The ball was to take place on Friday night. The house had been put in order, the carpets covered with canvas, the halls and stairs decorated with palms and potted plants; and in the afternoon Mr. Ryder sat on his front porch, which the shade of a vine running up over a wire netting made a cool and pleasant lounging-place. He expected to respond to the toast "The Ladies," at the supper, and from a volume of Tennyson--his favorite poet--was fortifying himself with apt quotations. The volume was open at A Dream of Fair Women. His eyes fell on these lines, and he read them aloud to judge better of their effect:--

"At length I saw a lady within call. Stiller than chisell'd marble, standing there; A daughter of the gods, divinely tall, And most divinely fair."

He marked the verse, and turning the page read the stanza beginning,--

"O sweet pale Margaret, O rare pale Margaret."

He weighed the passage a moment, and decided that it would not do. Mrs. Dixon was the palest lady he expected at the ball, and she was of a rather ruddy complexion, and of lively disposition and buxom build. So he ran over the leaves until his eye rested on the description of Queen Guinevere:--

"She seem'd a part of joyous Spring: A gown of grass-green silk she wore, Buckled with golden clasps before; A light-green tuft of plumes she bore Closed in a golden ring.

. . . . . .

"She look'd so lovely, as she sway'd The rein with dainty finger-tips, A man had given all other bliss, And all his worldly worth for this, To waste his whole heart in one kiss Upon her perfect lips."

As Mr. Ryder murmured these words audibly, with an appreciative thrill, he heard the latch of his gate click, and a light footfall sounding on the steps. He turned his head, and saw a woman standing before the door.

She was a little woman, not five feet tall, and proportioned to her height. Although she stood erect, and looked around her with very bright and restless eyes, she seemed quite old; for her face was crossed and recrossed with a hundred wrinkles, and around the edges of her bonnet could be seen protruding here and there a tuft of short gray wool. She wore a blue calico gown of ancient cut, a little red shawl fastened around her shoulders with an old-fashioned brass brooch, and a large bonnet profusely ornamented with faded red and yellow artificial flowers. And she was very black--so black that her toothless gums, revealed when she opened her mouth to speak, were not red, but blue. She looked like a bit of the old plantation life, summoned up from the past by the wave of a magician's wand, as the poet's fancy had called into being the gracious shapes of which Mr. Ryder had just been reading.

He rose from his chair and came over to where she stood.

"Good-afternoon, madam," he said.

"Good-evenin', suh," she answered, ducking suddenly with a quaint curtsy. Her voice was shrill and piping, but softened somewhat by age. "Is dis yere whar Mistuh Ryduh lib, suh?" she asked, looking around her doubtfully, and glancing into the open windows, through which some of the preparations for the evening were visible.

"Yes," he replied, with an air of kindly patronage, unconsciously flattered by her manner, "I am Mr. Ryder. Did you want to see me?"

"Yas, suh, ef I ain't 'sturbin' of you too much."

"Not at all. Have a seat over here behind the vine, where it is cool. What can I do for you?"

"'Scuse me, suh," she continued, when she had sat down on the edge of a chair, "'scuse me, suh, I's lookin' for my husban'. I heerd you wuz a big man an' had libbed heah a long time, an' I 'lowed you wouldn't min' ef I'd come roun' an' ax you ef you'd eber heerd of a merlatter man by de name er Sam Taylor 'quirin' roun' in de chu'ches ermongs' de people fer his wife 'Liza Jane?"

Mr. Ryder seemed to think for a moment.

"There used to be many such cases right after the war," he said, "but it has been so long that I have forgotten them. There are very few now. But tell me your story, and it may refresh my memory."

She sat back farther in her chair so as to be more comfortable, and folded her withered hands in her lap.

"My name's 'Liza," she began, "'Liza Jane. Wen I wuz young I us'ter b'long ter Marse Bob Smif, down in old Missourn. I wuz bawn down dere. W'en I wuz a gal I wuz married ter a man named Jim. But Jim died, an' after dat I married a merlatter man named Sam Taylor. Sam wuz free-bawn, but his mammy and daddy died, an' de w'ite folks 'prenticed him ter my marster fer ter work fer 'im 'tel he wuz growed up. Sam worked in de fiel', an' I wuz de cook. One day Ma'y Ann, ole miss's maid, come rushin' out ter de kitchen, an' says she, "Liza Jane, ole marse gwine sell yo' Sam down de ribber.'

"'Go way f'm yere,' says I; 'my husban's free!'

"'Don' make no diff'ence. I heerd ole marse tell ole miss he wuz gwine take yo' Sam 'way wid 'im ter-morrow, fer he needed money, an' he knowed whar he could git a t'ousan' dollars fer Sam an' no questions axed.'

"W'en Sam come home f'm de fiel', dat night, I tole him 'bout ole marse gwine steal 'im, an' Sam run erway. His time wuz mos' up, an' he swo' dat w'en he wuz twenty-one he would come back an' he'p me run erway, er else save up de money ter buy my freedom. An' I know he'd 'a' done it, fer he thought a heap er me, Sam did. But w'en he come back he didn' fin' me, fer I wuzn' dere. Ole marse had heerd dat I warned Sam, so he had me whip' an' sol' down de ribber.

"Den de wah broke out, an' w'en it wuz ober de cullud folks wuz scattered. I went back ter de ole home; but Sam wuzn' dere, an' I couldn' l'arn nuffin' 'bout 'im. But I knowed he'd be'n dere to look fer me an' hadn' foun' me, an' had gone erway ter hunt fer me.

"I's be'n lookin' fer 'im eber sence," she added simply, as though twenty-five years were but a couple of weeks, "an' I knows he's be'n lookin' fer me. Fer he sot a heap er sto' by me, Sam did, an' I know he's be'n huntin' fer me all dese years,--'less'n he's be'n sick er sump'n, so he couldn' work, er out'n his head, so he couldn' 'member his promise. I went back down de ribber, fer I 'lowed he'd gone down dere lookin' fer me. I's be'n ter Noo Orleens, an' Atlanty, an' Charleston, an' Richmon'; an' w'en I'd be'n all ober de Souf I come ter de Norf. Fer I knows I'll fin' 'im some er dese days," she added softly, "er he'll fin' me, an' den we'll bofe be as happy in freedom as we wuz in de ole days befo' de wah." A smile stole over her withered countenance as she paused a moment, and her bright eyes softened into a far-away look.

This was the substance of the old woman's story. She had wandered a little here and there. Mr. Ryder was looking at her curiously when she finished.

"How have you lived all these years?" he asked.

"Cookin', suh. I's a good cook. Does you know anybody w'at needs a good cook, suh? I's stoppin' wid a cullud fam'ly roun' de corner yonder 'tel I kin fin' a place."

"Do you really expect to find your husband? He may be dead long ago."

She shook her head emphatically. "Oh no, he ain' dead. De signs an' de tokens tells me. I dremp three nights runnin' on'y dis las' week dat I foun' him."

"He may have married another woman. Your slave marriage would not have prevented him, for you never lived with him after the war, and without that your marriage doesn't count."

"Wouldn' make no diff'ence wid Sam. He wouldn' marry no yuther 'ooman 'tel he foun' out 'bout me. I knows it," she added. "Sump'n's be'n tellin' me all dese years dat I's gwine fin' Sam 'fo I dies."

"Perhaps he's outgrown you, and climbed up in the world where he wouldn't care to have you find him."

"No, indeed, suh," she replied, "Sam ain' dat kin' er man. He wuz good ter me, Sam wuz, but he wuzn' much good ter nobody e'se, fer he wuz one er de triflin'es' han's on de plantation. I 'spec's ter haf ter suppo't 'im w'en I fin' 'im, fer he nebber would work 'less'n he had ter. But den he wuz free, an' he didn' git no pay fer his work, an' I don' blame 'im much. Mebbe he's done better sence he run erway, but I ain' 'spectin' much."

"You may have passed him on the street a hundred times during the twenty-five years, and not have known him; time works great changes."

She smiled incredulously. "I'd know 'im 'mongs' a hund'ed men. Fer dey wuzn' no yuther merlatter man like my man Sam, an' I couldn' be mistook. I's toted his picture roun' wid me twenty-five years."

"May I see it?" asked Mr. Ryder. "It might help me to remember whether I have seen the original."

As she drew a small parcel from her bosom, he saw that it was fastened to a string that went around her neck. Removing several wrappers, she brought to light an old-fashioned daguerreotype in a black case. He looked long and intently at the portrait. It was faded with time, but the features were still distinct, and it was easy to see what manner of man it had represented.

He closed the case, and with a slow movement handed it back to her.

"I don't know of any man in town who goes by that name," he said, "nor have I heard of any one making such inquiries. But if you will leave me your address, I will give the matter some attention, and if I find out anything I will let you know."

She gave him the number of a house in the neighborhood, and went away, after thanking him warmly.

He wrote down the address on the flyleaf of the volume of Tennyson, and, when she had gone, rose to his feet and stood looking after her curiously. As she walked down the street with mincing step, he saw several persons whom she passed turn and look back at her with a smile of kindly amusement. When she had turned the corner, he went upstairs to his bedroom, and stood for a long time before the mirror of his dressing-case, gazing thoughtfully at the reflection of his own face.

III.

At eight o'clock the ballroom was a blaze of light and the guests had begun to assemble; for there was a literary programme and some routine business of the society to be gone through with before the dancing. A black servant in evening dress waited at the door and directed the guests to the dressing-rooms.

The occasion was long memorable among the colored people of the city; not alone for the dress and display, but for the high average of intelligence and culture that distinguished the gathering as a whole. There were a number of school-teachers, several young doctors, three or four lawyers, some professional singers, an editor, a lieutenant in the United States army spending his furlough in the city, and others in various polite callings; these were colored, though most of them would not have attracted even a casual glance because of any marked difference from white people. Most of the ladies were in evening costume, and dress coats and dancing-pumps were the rule among the men. A band of string music, stationed in an alcove behind a row of palms, played popular airs while the guests were gathering.

The dancing began at half past nine. At eleven o'clock supper was served. Mr. Ryder had left the ballroom some little time before the intermission, but reappeared at the supper-table. The spread was worthy of the occasion, and the guests did full justice to it. When the coffee had been served, the toastmaster, Mr. Solomon Sadler, rapped for order. He made a brief introductory speech, complimenting host and guests, and then presented in their order the toasts of the evening. They were responded to with a very fair display of after-dinner wit.

"The last toast," said the toast-master, when he reached the end of the list, "is one which must appeal to us all. There is no one of us of the sterner sex who is not at some time dependent upon woman,--in infancy for protection, in manhood for companionship, in old age for care and comforting. Our good host has been trying to live alone, but the fair faces I see around me to-night prove that he too is largely dependent upon the gentler sex for most that makes life worth living,--the society and love of friends,--and rumor is at fault if he does not soon yield entire subjection to one of them. Mr. Ryder will now respond to the toast,--The Ladies."

There was a pensive look in Mr. Ryder's eyes as he took the floor and adjusted his eyeglasses. He began by speaking of woman as the gift of Heaven to man, and after some general observations on the relations of the sexes he said: "But perhaps the quality which most distinguishes woman is her fidelity and devotion to those she loves. History is full of examples, but has recorded none more striking than one which only to-day came under my notice."

He then related, simply but effectively, the story told by his visitor of the afternoon. He told it in the same soft dialect, which came readily to his lips, while the company listened attentively and sympathetically. For the story had awakened a responsive thrill in many hearts. There were some present who had seen, and others who had heard their fathers and grandfathers tell, the wrongs and sufferings of this past generation, and all of them still felt, in their darker moments, the shadow hanging over them. Mr. Ryder went on:--

"Such devotion and such confidence are rare even among women. There are many who would have searched a year, some who would have waited five years, a few who might have hoped ten years; but for twenty-five years this woman has retained her affection for and her faith in a man she has not seen or heard of in all that time.

"She came to me to-day in the hope that I might be able to help her find this long-lost husband. And when she was gone I gave my fancy rein, and imagined a case I will put to you.

"Suppose that this husband, soon after his escape, had learned that his wife had been sold away, and that such inquiries as he could make brought no information of her whereabouts. Suppose that he was young, and she much older than he; that he was light, and she was black; that their marriage was a slave marriage, and legally binding only if they chose to make it so after the war. Suppose, too, that he made his way to the North, as some of us have done, and there, where he had larger opportunities, had improved them, and had in the course of all these years grown to be as different from the ignorant boy who ran away from fear of slavery as the day is from the night. Suppose, even, that he had qualified himself, by industry, by thrift, and by study, to win the friendship and be considered worthy the society of such people as these I see around me to-night, gracing my board and filling my heart with gladness; for I am old enough to remember the day when such a gathering would not have been possible in this land. Suppose, too, that, as the years went by, this man's memory of the past grew more and more indistinct, until at last it was rarely, except in his dreams, that any image of this bygone period rose before his mind. And then suppose that accident should bring to his knowledge the fact that the wife of his youth, the wife he had left behind him,--not one who had walked by his side and kept pace with him in his upward struggle, but one upon whom advancing years and a laborious life had set their mark,--was alive and seeking him, but that he was absolutely safe from recognition or discovery, unless he chose to reveal himself. My friends, what

would the man do? I will suppose that he was one who loved honor, and tried to deal justly with all men. I will even carry the case further, and suppose that perhaps he had set his heart upon another, whom he had hoped to call his own. What would he do, or rather what ought he to do, in such a crisis of a lifetime?

"It seemed to me that he might hesitate, and I imagined that I was an old friend, a near friend, and that he had come to me for advice; and I argued the case with him. I tried to discuss it impartially. After we had looked upon the matter from every point of view, I said to him, in words that we all know:

'This above all: to thine own self be true, And it must follow, as the night the day, Thou canst not then be false to any man.'

Then, finally, I put the question to him, 'Shall you acknowledge her?'

"And now, ladies and gentlemen, friends and companions, I ask you, what should he have done?"

There was something in Mr. Ryder's voice that stirred the hearts of those who sat around him. It suggested more than mere sympathy with an imaginary situation; it seemed rather in the nature of a personal appeal. It was observed, too, that his look rested more especially upon Mrs. Dixon, with a mingled expression of renunciation and inquiry.

She had listened, with parted lips and streaming eyes. She was the first to speak: "He should have acknowledged her."

"Yes," they all echoed, "he should have acknowledged her."

"My friends and companions," responded Mr. Ryder, "I thank you, one and all. It is the answer I expected, for I knew your hearts."

He turned and walked toward the closed door of an adjoining room, while every eye followed him in wondering curiosity. He came back in a moment, leading by the hand his visitor of the afternoon, who stood startled and trembling at the sudden plunge into this scene of brilliant gayety. She was neatly dressed in gray, and wore the white cap of an elderly woman.

"Ladies and gentlemen," he said, "this is the woman, and I am the man, whose story I have told you. Permit me to introduce to you the wife of my youth."

THE BOUQUET by Charles W. Chesnutt

Mary Myrover's friends were somewhat surprised when she began to teach a colored school. Miss Myrover's friends are mentioned here, because nowhere more than in a Southern town is public opinion a force which cannot be lightly contravened. Public opinion, however, did not oppose Miss Myrover's teaching colored children; in fact, all the colored public schools in town--and there were several--were taught by white teachers, and had been so taught since the state had undertaken to provide free public instruction for all children within its boundaries. Previous to that time there had been a Freedman's Bureau school and a Presbyterian missionary school, but these had been withdrawn when the need for them became less pressing. The colored people of the town had been for some time agitating their right to teach their own schools, but as yet the claim had not been conceded.

The reason Miss Myrover's course created some surprise was not, therefore, the fact that a Southern white woman should teach a colored school; it lay in the fact that up to this time no woman of just her quality had taken up such work. Most of the teachers of colored schools were not of those who had constituted the aristocracy of the old regime; they might be said rather to represent the new order of things, in which labor was in time to become honorable, and men were, after a somewhat longer time, to depend, for their place in society, upon themselves rather than upon their ancestors. But Mary Myrover belonged to one of the proudest of the old families. Her ancestors had been people of distinction in Virginia before a collateral branch of the main stock had settled in North Carolina. Before the war they had been able to live up to their pedigree. But the war brought sad changes. Miss Myrover's father--the Colonel Myrover who led a gallant but desperate charge at Vicksburg--had fallen on the battlefield, and his tomb in the white cemetery was a shrine for the family. On the Confederate Memorial Day no other grave was so profusely decorated with flowers, and in the oration pronounced the name of Colonel Myrover was always used to illustrate the highest type of patriotic devotion and self-sacrifice. Miss Myrover's brother, too, had fallen in the conflict; but his bones lay in some unknown trench, with those of a thousand others who had fallen on the same field. Ay, more, her lover, who had hoped to come home in the full tide of victory and claim his bride as a reward for gallantry, had shared the fate of her father and brother. When the war was over, the remnant of the family found itself involved in the common ruin,--more deeply involved, indeed, than some others; for Colonel Myrover had believed in the ultimate triumph of his cause, and had invested most of his wealth in Confederate bonds, which were

now only so much waste paper.

There had been a little left. Mrs. Myrover was thrifty, and had laid by a few hundred dollars, which she kept in the house to meet unforeseen contingencies. There remained, too, their home, with an ample garden and a well-stocked orchard, besides a considerable tract of country land, partly cleared, but productive of very little revenue.

With their shrunken resources, Miss Myrover and her mother were able to hold up their heads without embarrassment for some years after the close of the war. But when things were adjusted to the changed conditions, and the stream of life began to flow more vigorously in the new channels, they saw themselves in danger of dropping behind, unless in some way they could add to their meagre income. Miss Myrover looked over the field of employment, never very wide for women in the South, and found it occupied. The only available position she could be supposed prepared to fill, and which she could take without distinct loss of caste, was that of a teacher, and there was no vacancy except in one of the colored schools. Even teaching was a doubtful experiment; it was not what she would have preferred, but it was the best that could be done.

"I don't like it, Mary," said her mother. "It's a long step from owning such people to teaching them. What do they need with education? It will only make them unfit for work."

"They're free now, mother, and perhaps they'll work better if they're taught something. Besides, it's only a business arrangement, and doesn't involve any closer contact than we have with our servants."

"Well, I should say not!" sniffed the old lady. "Not one of them will ever dare to presume on your position to take any liberties with us. I'll see to that."

Miss Myrover began her work as a teacher in the autumn, at the opening of the school year. It was a novel experience at first. Though there always had been negro servants in the house, and though on the streets colored people were more numerous than her own people, and though she was so familiar with their dialect that she might almost be said to speak it, barring certain characteristic grammatical inaccuracies, she had never been brought in personal contact with so many of them at once as when she confronted the fifty or sixty faces--of colors ranging from a white almost as clear as her own to the darkest livery of the sun--which were gathered in the schoolroom on the morning when she began her duties. Some of the inherited prejudice of her caste, too, made itself felt, though she tried to repress any outward sign of it; and she could perceive that the children were not altogether responsive; they, likewise, were not entirely free from antagonism. The work was unfamiliar to her. She was not physically very strong, and at the close of the first day she went home with a splitting headache. If she could have resigned then and there without causing comment or annoyance to others, she would have felt it a privilege to do so. But a night's rest banished her headache and improved her spirits, and the next morning she went to her work with renewed vigor, fortified by the experience of the first day.

Miss Myrover's second day was more satisfactory. She had some natural talent for organization, though she had never known it, and in the course of the day she got her classes formed and lessons under way. In a week or two she began to classify her pupils in her own mind, as bright or stupid, mischievous or well behaved, lazy or industrious, as the case might be, and to regulate her discipline accordingly. That she had come of a long line of ancestors who had exercised authority and mastership was perhaps not without its effect upon her character, and enabled her more readily to maintain good order in the school. When she was fairly broken in she found the work rather to her liking, and derived much pleasure from such success as she achieved as a teacher.

It was natural that she should be more attracted to some of her pupils than to others. Perhaps her favorite--or rather, the one she liked best, for she was too fair and just for conscious favoritism--was Sophy Tucker. Just the ground for the teacher's liking for Sophy might not at first be apparent. The girl was far from the whitest of Miss Myrover's pupils; in fact, she was one of the darker ones. She was not the brightest in intellect, though she always tried to learn her lessons. She was not the best dressed, for her mother was a poor widow, who went out washing and scrubbing for a living. Perhaps the real tie between them was Sophy's intense devotion to the teacher. It had manifested itself almost from the first day of the school, in the rapt look of admiration Miss Myrover always saw on the little black face turned toward her. In it there was nothing of envy, nothing of regret; nothing but worship for the beautiful white lady--she was not especially handsome, but to Sophy her beauty was almost divine--who had come to teach her. If Miss Myrover dropped a book, Sophy was the first to spring and pick it up; if she wished a chair moved, Sophy seemed to anticipate her wish; and so of all the numberless little services that can be rendered in a school-room.

Miss Myrover was fond of flowers, and liked to have them about her. The children soon learned of this taste of hers, and kept the vases on her desk filled with blossoms during their season. Sophy was perhaps the most active in providing them. If she could not get garden flowers, she would make excursions to the woods in the early morning, and bring in great dew-laden bunches of bay, or jasmine, or some other fragrant forest flower which she knew the teacher loved.

"When I die, Sophy," Miss Myrover said to the child one day, "I want to be covered with roses. And when they bury me, I'm sure I shall rest better if my grave is banked with flowers, and roses are planted at my head and at my feet."

Miss Myrover was at first amused at Sophy's devotion; but when she grew more accustomed to it, she found it rather to her liking. It had a sort of flavor of the old regime, and she felt, when she bestowed her kindly notice upon her little black attendant, some of the feudal condescension of the mistress toward the slave. She was kind to Sophy, and permitted her to play the role she had assumed, which caused sometimes a little jealousy among the other girls. Once she gave Sophy a yellow ribbon which she took from her own hair. The child carried it home, and cherished it as a priceless treasure, to be worn only on the greatest occasions.

Sophy had a rival in her attachment to the teacher, but the rivalry was altogether friendly. Miss Myrover had a little dog, a white spaniel, answering to the name of Prince. Prince was a dog of high degree, and would have very little to do with the children of the school; he made an exception, however, in the case of Sophy, whose devotion for his mistress he seemed to comprehend. He was a clever dog, and could fetch and carry, sit up on his haunches, extend his paw to shake hands, and possessed several other canine accomplishments. He was very fond of his mistress, and always, unless shut up at home, accompanied her to school, where he spent most of his time lying under the teacher's desk, or, in cold weather, by the stove, except when he would go out now and then and chase an imaginary rabbit round the yard, presumably for exercise.

At school Sophy and Prince vied with each other in their attentions to Miss Myrover. But when school was over, Prince went away with her, and Sophy stayed behind; for Miss Myrover was white and Sophy was black, which they both understood perfectly well. Miss Myrover taught the colored children, but she could not be seen with them in public. If they occasionally met her on the street, they did not expect her to speak to them, unless she happened to be alone and no other white person was in sight. If any of the children felt slighted, she was not aware of it, for she intended no slight; she had not been brought up to speak to negroes on the street, and she could not act differently from other people. And though she was a woman of sentiment and capable of deep feeling, her training had been such that she hardly expected to find in those of darker hue than herself the same susceptibility--varying in degree, perhaps, but yet the same in kind--that gave to her own life the alternations of feeling that made it most worth living.

Once Miss Myrover wished to carry home a parcel of books. She had the bundle in her hand when Sophy came up.

"Lemme tote yo' bundle fer yer, Miss Ma'y?" she asked eagerly. "I'm gwine yo' way."

"Thank you, Sophy," was the reply. "I'll be glad if you will."

Sophy followed the teacher at a respectful distance. When they reached Miss Myrover's home Sophy carried the bundle to the doorstep, where Miss Myrover took it and thanked her.

Mrs. Myrover came out on the piazza as Sophy was moving away. She said, in the child's hearing, and perhaps with the intention that she should hear: "Mary, I wish you wouldn't let those little darkies follow you to the house. I don't want them in the yard. I should think you'd have enough of them all day."

"Very well, mother," replied her daughter. "I won't bring any more of them. The child was only doing me a favor."

Mrs. Myrover was an invalid, and opposition or irritation of any kind brought on nervous paroxysms that made her miserable, and made life a burden to the rest of the household; so that Mary seldom crossed her whims. She did not bring Sophy to the house again, nor did Sophy again offer her services as porter.

One day in spring Sophy brought her teacher a bouquet of yellow roses.

"Dey come off'n my own bush, Miss Ma'y," she said proudly, "an' I didn' let nobody e'se pull 'em, but saved 'em all fer you, 'cause I know you likes roses so much. I'm gwine bring 'em all ter you as long as dey las'."

"Thank you, Sophy," said the teacher; "you are a very good girl."

For another year Mary Myrover taught the colored school, and did excellent service. The children made rapid progress under her tuition, and learned to love her well; for they saw and appreciated, as well as children could, her fidelity to a trust that she might have slighted, as some others did, without much fear of criticism. Toward the end of her second year she sickened, and after a brief illness died.

Old Mrs. Myrover was inconsolable. She ascribed her daughter's death to her labors as teacher of negro children. Just how the color of the pupils had produced the fatal effects she did not stop to explain. But she was too old, and had suffered too deeply from the war, in body and mind and estate, ever to reconcile herself to the changed order of things following the return of peace; and with an unsound yet not unnatural logic, she visited some of her displeasure upon those who had profited most, though passively, by her losses.

"I always feared something would happen to Mary," she said. "It seemed unnatural for her to be wearing herself out teaching little negroes who ought to have been working for her. But the world has hardly been a fit place to live in since the war, and when I follow her, as I must before long, I shall not be sorry to go."

She gave strict orders that no colored people should be admitted to the house. Some of her friends heard of this, and remonstrated. They knew the teacher was loved by the pupils, and felt that sincere respect from the humble would be a worthy tribute to the proudest. But Mrs. Myrover was obdurate.

"They had my daughter when she was alive," she said, "and they've killed her. But she's mine now, and I won't have them come near her. I don't want one of them at the funeral or anywhere around."

For a month before Miss Myrover's death Sophy had been watching her rosebush--the one that bore the yellow roses--for the first buds of spring, and when these appeared had awaited impatiently their gradual unfolding. But not until her teacher's death had they become full-blown roses. When Miss Myrover died, Sophy determined to pluck the roses and lay them on her coffin. Perhaps, she thought, they might even put them in her hand or on her breast. For Sophy remembered Miss Myrover's thanks and praise when she had brought her the yellow roses the spring before.

On the morning of the day set for the funeral Sophy washed her face until it shone, combed and brushed her hair with painful conscientiousness, put on her best frock, plucked her yellow roses, and, tying them with the treasured ribbon her teacher had given her, set out for Miss Myrover's home.

She went round to the side gate--the house stood on a corner--and stole up the path to the kitchen. A colored woman, whom she did not know, came to the door.

"W'at yer want, chile?" she inquired.

"Kin I see Miss Ma'y?" asked Sophy timidly.

"I don' know, honey. Ole Miss Myrover say she don' want no cullud folks roun' de house endyoin' dis fun'al. I'll look an' see if she's roun' de front room, whar de co'pse is. You sed-down heah an' keep still, an' ef she's upstairs maybe I kin git yer in dere a minute. Ef I can't, I kin put yo' bokay 'mongs' de res', whar she won't know nuthin' erbout it."

A moment after she had gone there was a step in the hall, and old Mrs. Myrover came into the kitchen.

"Dinah!" she said in a peevish tone. "Dinah!"

Receiving no answer, Mrs. Myrover peered around the kitchen, and caught sight of Sophy.

"What are you doing here?" she demanded.

"I--I'm-m waitin' ter see de cook, ma'am," stammered Sophy.

"The cook isn't here now. I don't know where she is. Besides, my daughter is to be buried to-day, and I won't have any one visiting the servants until the funeral is over. Come back some other day, or see the cook at her own home in the evening."

She stood waiting for the child to go, and under the keen glance of her eyes Sophy, feeling as though she had been caught in some disgraceful act, hurried down the walk and out of the gate, with her bouquet in her hand.

"Dinah," said Mrs. Myrover, when the cook came back, "I don't want any strange people admitted here to-day. The house will be full of our friends, and we have no room for others."

"Yas'm," said the cook. She understood perfectly what her mistress meant; and what the cook thought about her mistress was a matter of no consequence.

The funeral services were held at St. John's Episcopal Church, where the Myrovers had always worshiped. Quite a number of Miss Myrover's pupils went to the church to attend the services. The church was not a large one. There was a small gallery at the rear, to which colored people were admitted, if they chose to come, at ordinary services; and those who wished to be present at the funeral supposed that the usual custom would prevail. They were therefore surprised, when they went to the side entrance, by which colored people gained access to the gallery stairs, to be met by an usher who barred their passage.

"I'm sorry," he said, "but I have had orders to admit no one until the friends of the family have all been seated. If you wish to wait until the white people have all gone in, and there's any room left, you may be able to get into the back part of the gallery. Of course I can't tell yet whether there'll be any room or not."

Now the statement of the usher was a very reasonable one; but, strange to say, none of the colored people chose to remain except Sophy. She still hoped to use her floral offering for its destined end, in some way, though she did not know just how. She waited in the yard until the church was filled with white people, and a number who could not gain admittance were standing about the doors. Then she went round to the side of the church, and, depositing her bouquet carefully on an old mossy gravestone, climbed up on the projecting sill of a window near the chancel. The window was of stained glass, of somewhat ancient make. The church was old, had indeed been built in colonial times, and the stained glass had been brought from England. The design of the window showed Jesus blessing little children. Time had dealt gently with the window; but just at the feet of the figure of Jesus a small triangular piece of glass had been broken out. To this aperture Sophy applied her eyes, and through it saw and heard what she could of the services within.

Before the chancel, on trestles draped in black, stood the sombre casket in which lay all that was mortal of her dear teacher. The top of the casket was covered with flowers; and lying stretched out underneath it she saw Miss Myrover's little white dog, Prince. He had followed the body to the church, and, slipping in unnoticed among the mourners, had taken his place, from which no one had the heart to remove him.

The white-robed rector read the solemn service for the dead, and then delivered a brief address, in which he spoke of the uncertainty of life, and, to the believer, the certain blessedness of eternity. He spoke of Miss Myrover's kindly spirit, and, as an illustration of her love and self-sacrifice for others, referred to her labors as a teacher of the poor ignorant negroes who had been placed in their midst by an all-wise Providence, and whom it was their duty to guide and direct in the station in which God had put them. Then the organ pealed, a prayer was said, and the long cortege moved from the church to the cemetery, about half a mile away, where the body was to be interred.

When the services were over, Sophy sprang down from her perch, and, taking her flowers, followed the procession. She did not walk with the rest, but at a proper and respectful distance from the last mourner. No one noticed the little black girl with the bunch of yellow flowers, or thought of her as interested in the funeral.

The cortege reached the cemetery and filed slowly through the gate; but Sophy stood outside, looking at a small sign in white letters on a black background:--

"NOTICE. This cemetery is for white people only. Others please keep out."

Sophy, thanks to Miss Myrover's painstaking instruction, could read this sign very distinctly. In fact, she had often read it before. For Sophy was a child who loved beauty, in a blind, groping sort of way, and had sometimes stood by the fence of the cemetery and looked through at the green mounds and shaded walks and blooming flowers within, and wished that she could walk among them. She knew, too, that the little sign on the gate, though so courteously worded, was no mere formality; for she had heard how a colored man, who had wandered into the cemetery on a hot night and fallen asleep on the flat top of a tomb, had been arrested as a vagrant and fined five dollars, which he had worked out on the streets, with a ball-and-chain attachment, at twenty-five cents a day. Since that time the cemetery gate had been locked at night.

So Sophy stayed outside, and looked through the fence. Her poor bouquet had begun to droop by this time, and the yellow ribbon had lost some of its freshness. Sophy could see the rector standing by the grave, the mourners gathered round; she could faintly distinguish the solemn words with which ashes were committed to ashes, and dust to dust. She heard the hollow thud of the earth falling on the coffin; and she leaned against the iron fence, sobbing softly, until the grave was filled and rounded off, and the wreaths and other floral pieces were disposed upon it. When the mourners began to move toward the gate, Sophy walked slowly down the street, in a direction opposite to that taken by most of the people who came out.

When they had all gone away, and the sexton had come out and locked the gate behind him, Sophy crept back. Her roses were faded now, and from some of them the petals had fallen. She stood there irresolute, loath to leave with her heart's desire unsatisfied, when, as her eyes fell upon the teacher's last resting place, she saw lying beside the new-made grave what looked like a small bundle of white wool. Sophy's eyes lighted up with a sudden glow.

"Prince! Here, Prince!" she called.

The little dog rose, and trotted down to the gate. Sophy pushed the poor bouquet between the iron bars. "Take that ter Miss Ma'y, Prince," she said, "that's a good doggie."

The dog wagged his tail intelligently, took the bouquet carefully in his mouth, carried it to his mistress's grave, and laid it among the other flowers. The bunch of roses was so small that from where she stood Sophy could see only a dash of yellow against the white background of the mass of flowers.

When Prince had performed his mission he turned his eyes toward Sophy inquiringly, and when she gave him a nod of approval lay down and resumed his watch by the graveside. Sophy looked at him a moment with a feeling very much like envy, and then turned and moved slowly away.

THE CASE OF THE NEGRO by Booker T. Washington

All attempts to settle the question of the Negro in the South by his removal from this country have so far failed, and I think that they are likely to fail. The next census will probably show that we have nearly ten million black people in the United States, about eight millions of whom are in the Southern states. In fact, we have almost a nation within a nation. The Negro population in the United States lacks but two millions of being as large as the whole population of Mexico, and is nearly twice as large as that of Canada. Our black people equal in number the combined populations of Switzerland, Greece, Honduras, Nicaragua, Cuba, Uraguay [sic], Santo Domingo, Paraguay, and Costa Rica. When we consider, in connection with these facts, that the race has doubled itself since its freedom, and is still increasing, it hardly seems possible for any one to take seriously any scheme of emigration from America as a method of solution. At most, even if the government were to provide the means, but a few hundred thousand could be transported each year. The yearly increase in population would more than likely overbalance the number transported. Even if it did not, the time required to get rid of the Negro by this method would perhaps be fifty or seventy-five years.

Some have advised that the Negro leave the South, and take up his residence in the Northern states. I question whether this would make him any better off than he is in the South, when all things are considered. It has been my privilege to study the condition of our people in nearly every part of America; and I say without hesitation that, with some exceptional cases, the Negro is at his best in the Southern states. While he enjoys certain privileges in the North that he does not have in the South, when it comes to the matter of securing property, enjoying business advantages and employment, the South presents a far better opportunity than the North. Few colored men from the South are as yet able to stand up against the severe and increasing competition that exists in the North, to say nothing of the unfriendly influence of labor organizations, which in some way prevents black men in the North, as a rule, from securing occupation in the line of skilled labor.

Another point of great danger for the colored man who goes North is the matter of morals, owing to the numerous temptations by which he finds himself surrounded. More ways offer in which he can spend money than in the South, but fewer avenues of employment for earning money are open to him. The fact that at the North the Negro is almost confined to one line of occupation often tends to discourage and demoralize the strongest who go from the South, and makes them an easy prey for temptation. A few years ago, I made an examination into the condition of a settlement of Negroes who left the South and went into Kansas about twenty years since, when there was a good deal of excitement in the South concerning emigration from the West, and found it much below the standard of that of similar communities in the South. The only conclusion which any one can reach, from this and like instances, is that the Negroes are to remain in the Southern states. As a race they do not want to leave the South, and the

Southern white people do not want them to leave. We must therefore find some basis of settlement that will be constitutional, just, manly; that will be fair to both races in the South and to the whole country. This cannot be done in a day, a year, or any short period of time. We can, however, with the present light, decide upon a reasonably safe method of solving the problem, and turn our strength and effort in that direction. In doing this, I would not have the Negro deprived of any privilege guaranteed to him by the Constitution of the United States. It is not best for the Negro that he relinquish any of his constitutional rights; it is not best for the Southern white man that he should, as I shall attempt to show in this article.

In order that we may concentrate our forces upon a wise object, without loss of time or effort, I want to suggest what seems to me and many others the wisest policy to be pursued. I have reached these conclusions not only by reason of my own observations and experience, but after eighteen years of direct contact with leading and influential colored and white men in most parts of our country. But I wish first to mention some elements of danger in the present situation, which all who desire the permanent welfare of both races in the South should carefully take into account.

First. There is danger that a certain class of impatient extremists among the Negroes in the North, who have little knowledge of the actual conditions in the South, may do the entire race injury by attempting to advise their brethren in the South to resort to armed resistance or the use of the torch, in order to secure justice. All intelligent and well-considered discussion of any important question, or condemnation of any wrong, whether in the North or the South, from the public platform and through the press, is to be commended and encouraged; but ill-considered and incendiary utterances from black men in the North will tend to add to the burdens of our people in the South rather than to relieve them. We must not fall into the temptation of believing that we can raise ourselves by abusing some one else.

Second. Another danger in the South which should be guarded against is that the whole white South, including the wise, conservative, law-abiding element, may find itself represented before the bar of public opinion by the mob or lawless element, which gives expression to its feelings and tendency in a manner that advertises the South throughout the world; while too often those who have no sympathy with such disregard of law are either silent, or fail to speak in a sufficiently emphatic manner to offset in any large degree the unfortunate reputation which the lawless have made for many portions of the South.

Third. No race or people ever got upon its feet without severe and constant struggle, often in the face of the greatest discouragement. While passing through the present trying period of its history, there is danger that a large and valuable element of the Negro race may become discouraged in the effort to better its condition. Every possible influence should be exerted to prevent this.

Fourth. There is a possibility that harm may be done to the South and to the Negro by exaggerated newspaper articles which are written near the scene or in the midst of specially aggravating occurrences. Often these reports are written by newspaper men, who give the impression that there is a race conflict throughout the South, and that all Southern white people are opposed to the Negro's progress; overlooking the fact that though in some sections there is trouble, in most parts of the South, if matters are not yet in all respects as we would have them, there is nevertheless a very large measure of peace, good will, and mutual helpfulness. In the same relation, much can be done to retard the progress of the Negro by a certain class of Southern white people, who in the midst of excitement speak or write in a manner that gives the impression that all Negroes are lawless, untrustworthy, and shiftless. For example, a Southern writer said, not long ago, in a communication to the New York Independent: "Even in small towns the husband cannot venture to leave his wife alone for an hour at night. At no time, in no place, is the white woman safe from the insults and assaults of these creatures." These statements, I presume, represented the feelings and the conditions that existed, at the time of the writing, in one community or county in the South; but thousands of Southern white men and women would be ready to testify that this is not the condition throughout the South, nor throughout any Southern state.

Fifth. Owing to the lack of school opportunities for the Negro in the rural districts of the South, there is danger that ignorance and idleness may increase to the extent of giving the Negro race a reputation for crime, and that immorality may eat its way into the fibre of the race so as to retard its progress for many years. In judging the Negro we must not be too harsh. We must remember that it has been only within the last thirty-four years that the black father and mother have had the responsibility, and consequently the experience, of training their own children. That perfection has not been reached in one generation, with the obstacles that the parents have been compelled to overcome, is not to be wondered at.

Sixth. Finally, I would mention my fear that some of the white people of the South may be led to feel that the way to settle the race problem is to repress the aspirations of the Negro by legislation of a kind that confers certain legal or political privileges upon an

ignorant and poor white man, and withholds the same privileges from a black man in a similar condition. Such legislation injures and retards the progress of both races. It is an injustice to the poor white man, because it takes from him incentive to secure education and property as prerequisites for voting. He feels that because he is a white man, regardless of his possessions, a way will be found for him to vote. I would label all such measures "laws to keep the poor white man in ignorance and poverty."

The Talladega News Reporter, a Democratic newspaper of Alabama, recently said: "But it is a weak cry when the white man asks odds on intelligence over the Negro. When nature has already so handicapped the African in the race for knowledge, the cry of the boasted Anglo-Saxon for still further odds seems babyish. What wonder that the world looks on in surprise, if not disgust? It cannot help but say, If our contention be true that the Negro is an inferior race, then the odds ought to be on the other side, if any are to be given. And why not? No; the thing to do--the only thing that will stand the test of time--is to do right, exactly right, let come what will. And that right thing, as it seems to us, is to place a fair educational qualification before every citizen,--one that is self-testing, and not dependent on the wishes of weak men,--letting all who pass the test stand in the proud ranks of American voters, whose votes shall be counted as cast, and whose sovereign will shall be maintained as law by all the powers that be. Nothing short of this will do. Every exemption, on whatsoever ground, is an outrage that can only rob some legitimate voter of his rights."

Such laws have been made,--in Mississippi, for example,--with the "understanding" clause, hold out a temptation for the election officer to perjure and degrade himself by too often deciding that the ignorant white man does understand the Constitution when it is read to him, and that the ignorant black man does not. By such a law, the state not only commits a wrong against its black citizens; it injures the morals of its white citizens by conferring such a power upon any white man who may happen to be a judge of elections.

Such laws are hurtful, again, because they keep alive in the heart of the black man the feeling that the white man means to oppress him. The only safe way out is to set a high standard as a test of citizenship, and require blacks and whites alike to come up to it. When this is done, both will have a higher respect for the election laws, and for those who make them. I do not believe that, with his centuries of advantage over the Negro in the opportunity to acquire property and education as prerequisites for voting, the average white man in the South desires that any special law be passed to give him further advantage over one who has had but a little more than thirty years in which to prepare himself for citizenship. In this relation, another point of danger is that the Negro has been made to feel that it is his duty continually to oppose the Southern white man in politics, even in matters where no principle is involved; and that he is only loyal to his own race and acting in a manly way in thus opposing the white man. Such a policy has proved very hurtful to both races. Where it is a matter of principle, where a question of right or wrong is involved, I would advise the Negro to stand by principle at all hazards. A Southern white man has no respect for or confidence in a Negro who acts merely for policy's sake; but there are many cases, and the number is growing, where the Negro has nothing to gain, and much to lose, by opposing the Southern white man in matters that relate to government.

Under the foregoing six heads I believe I have stated some of the main points which, all high-minded white men and black men, North and South, will agree, need our most earnest and thoughtful consideration, if we would hasten, and not hinder, the progress of our country.

Now as to the policy that should be pursued. On this subject I claim to possess no superior wisdom or unusual insight. I may be wrong; I may be in some degree right.

In the future we want to impress upon the Negro, more than we have done in the past, the importance of identifying himself more closely with the interests of the South; of making himself part of the South, and at home in it. Heretofore, for reasons which were natural, and for which no one is especially to blame, the colored people have been too much like a foreign nation residing in the midst of another nation. If William Lloyd Garrison, Wendell Phillips, or George L. Stearns were alive to-day, I feel sure that he would advise the Negroes to identify their interests as closely as possible with those of their white neighbors,--always understanding that no question of right and wrong is involved. In no other way, it seems to me, can we get a foundation for peace and progress. He who advises against this policy will advise the Negro to do that which no people in history, who have succeeded, have done. The white man, North or South, who advises the Negro against it advises him to do that which he himself has not done. The bed rock upon which every individual rests his chances for success in life is the friendship, the confidence, the respect, of his next-door neighbor in the little community in which he lives. The problem of the Negro in the South turns on whether he can make himself of such indispensable service to his neighbor and the community that no one can fill his place better in the body politic. There is at present no other safe course for the black man to pursue. If the Negro in the South has a friend in his white neighbor, and a still larger number of friends in his own community, he has a protection and a guarantee of his rights that will be more potent and more

lasting than any our Federal Congress or any outside power can confer.

The London Times, in a recent editorial discussing affairs in the Transvaal, where Englishmen have been denied certain privileges by the Boers, says: "England is too sagacious not to prefer a gradual reform from within, even should it be less rapid than most of us might wish, to the most sweeping redress of grievances imposed from without. Our object is to obtain fair play for the Outlanders, but the best way to do it is to enable them to help themselves." This policy, I think, is equally safe when applied to conditions in the South. The foreigner who comes to America identifies himself as soon as possible, in business, education, and politics, with the community in which he settles. We have a conspicuous example of this in the case of the Jews, who in the South, as well as in other parts of our country, have not always been justly treated; but the Jews have so woven themselves into the business and patriotic interests of the communities in which they live, have made themselves so valuable as citizens, that they have won a place in the South which they could have obtained in no other way. The Negro in Cuba has practically settled the race question there, because he has made himself a part of Cuba in thought and action.

What I have tried to indicate cannot be accomplished by any sudden revolution of methods, but it does seem that the tendency should be more and more in this direction. Let me emphasize this by a practical example. The North sends thousands of dollars into the South every year for the education of the Negro. The teachers in most of the Southern schools supported by the North are Northern men and women of the highest Christian culture and most unselfish devotion. The Negro owes them a debt of gratitude which can never be paid. The various missionary societies in the North have done a work which to a large degree has proved the salvation of the South, and the results of it will appear more in future generations than in this. We have now reached the point, in the South, where, I believe, great good could be accomplished in changing the attitude of the white people toward the Negro, and of the Negro toward the whites, if a few Southern white teachers, of high character, would take an active interest in the work of our higher schools. Can this be done? Yes. The medical school connected with Shaw University at Raleigh, North Carolina, has from the first had as instructors and professors almost exclusively Southern white doctors who reside in Raleigh, and they have given the highest satisfaction. This gives the people of Raleigh the feeling that the school is theirs, and not something located in, but not a part of, the South. In Augusta, Georgia, the Payne Institute, one of the best colleges for our people, is officered and taught almost wholly by Southern white men and women. The Presbyterian Theological School at Tuscaloosa, Alabama, has only Southern white men as instructors. Some time ago, at the Calhoun School in Alabama, one of the leading white men in the county was given an important position; since then the feeling of the white people in the county has greatly changed toward the school.

We must admit the stern fact that at present the Negro, through no choice of his own, is living in the midst of another race, which is far ahead of him in education, property, and experience; and further, that the Negro's present condition makes him dependent upon the white people for most of the things necessary to sustain life, as well as, in a large measure, for his education. In all history, those who have possessed the property and intelligence have exercised the greatest control in government, regardless of color, race, or geographical location. This being the case, how can the black man in the South improve his estate? And does the Southern white man want him to improve it? The latter part of this question I shall attempt to answer later in this article.

The Negro in the South has it within his power, if he properly utilizes the forces at land, to make of himself such a valuable factor in the life of the South that for the most part he need not seek privileges, but they will be conferred upon him. To bring this about, the Negro must begin at the bottom and lay a sure foundation, and not be lured by any temptation into trying to rise on a false footing. While the Negro is laying this foundation, he will need help and sympathy and justice from the law. Progress by any other method will be but temporary and superficial, and the end of it will be worse than the beginning. American slavery was a great curse to both races, and I should be the last to apologize for it; but in the providence of God I believe that slavery laid the foundation for the solution of the problem that is now before us in the South. Under slavery, the Negro was taught every trade, every industry, that furnishes the means of earning a living. Now if on this foundation, laid in a rather crude way, it is true, but a foundation nevertheless, we can gradually grow and improve, the future for us is bright. Let me be more specific. Agriculture is or has been the basic industry of nearly every race or nation that has succeeded. The Negro got a knowledge of this under slavery: hence in a large measure he is in possession of this industry in the South to-day. Taking the whole South, I should say that eighty per cent of the Negroes live by agriculture in some form, though it is often a very primitive and crude form. The Negro can buy land in the South, as a rule, wherever the white man can buy it, and at very low prices. Now, since the bulk of our people already have a foundation in agriculture, are at their best when living in the country engaged in agricultural pursuits, plainly, the best thing, the logical thing, is to turn the larger part of our strength in a direction that will put the Negroes among the most skilled agricultural people in the world. The man who has learned to do something better than any one else, has learned to do a common thing in an uncommon manner, has power and influence which no adverse surroundings can take from him. It is better to show a man how to make a place for

himself than to put him in one that some one else has made for him. The Negro who can make himself so conspicuous as a successful farmer, a large taxpayer, a wise helper of his fellow men, as to be placed in a position of trust and honor by natural selection, whether the position be political or not, is a hundredfold more secure in that position than one placed there by mere outside force or pressure. I know a Negro, Hon. Isaiah T. Montgomery, in Mississippi, who is mayor of a town; it is true that the town is composed almost wholly of Negroes. Mr. Montgomery is mayor of this town because his genius, thrift, and foresight have created it; and he is held and supported in his office by a charter granted by the state of Mississippi, and by the vote and public sentiment of the community in which he lives.

Let us help the Negro by every means possible to acquire such an education in farming, dairying, stock-raising, horticulture, etc., as will place him near the top in these industries, and the race problem will in a large part be settled, or at least stripped of many of its most perplexing elements. This policy would also tend to keep the Negro in the country and smaller towns, where he succeeds best, and stop the influx into the large cities, where he does not succeed so well. The race, like the individual, which produces something of superior worth that has a common human interest, wins a permanent place, and is bound to be recognized.

At a county fair in the South, not long ago, I saw a Negro awarded the first prize, by a jury of white men, over white competitors, for the production of the best specimen of Indian corn. Every white man at the fair seemed to be proud of the achievement of the Negro, because it was apparent that he had done something that would add to the wealth and comfort of the people of both races in that county. At the Tuskegee Normal and Industrial Institute, in Alabama, we have a department devoted to training men along the lines of agriculture that I have named; but what we are doing is small when compared with what should be done in Tuskegee, and at other educational centres. In a material sense the South is still an undeveloped country. While in some other affairs race prejudice is strongly marked, in the matter of business, of commercial and industrial development, there are few obstacles in the Negro's way. A Negro who produces or has for sale something that the community wants finds customers among white people as well as black. Upon equal security, a Negro can borrow money at the bank as readily as a white man can. A bank in Birmingham, Alabama, which has existed ten years, is officered and controlled wholly by Negroes. This bank has white borrowers and white depositors. A graduate of the Tuskegee Institute keeps a well-appointed grocery store in Tuskegee, and he tells me that he sells about as many goods to one race as to the other. What I have said of the opening that awaits the Negro in the business of agriculture is almost equally true of mechanics, manufacturing, and all the domestic arts. The field is before him and right about him. Will he seize upon it? Will he "cast down his bucket where he is"? Will his friends, North and South, encourage him and prepare him to occupy it? Every city in the South, for example, would give support to a first-class architect or housebuilder or contractor of our race. The architect or contractor would not only receive support, but through his example numbers of young colored men would learn such trades as carpentry, brickmasonry, plastering, painting, etc., and the race would be put into a position to hold on to many of the industries which it is now in danger of losing, because in too many cases brain, skill, and dignity are not imparted to the common occupations. Any individual or race that does not fit itself to occupy in the best manner the field or service that is right about it will sooner or later be asked to move on and let another take it.

But I may be asked, Would you confine the Negro to agriculture, mechanics, the domestic arts, etc.? Not at all; but just now and for a number of years the stress should be laid along the lines that I have mentioned. We shall need and must have many teachers and ministers, some doctors and lawyers and statesmen, but these professional men will have a constituency or a foundation from which to draw support just in proportion as the race prospers along the economic lines that I have pointed out. During the first fifty or one hundred years of the life of any people, are not the economic occupations always given the greater attention? This is not only the historic, but, I think, the common-sense view. If this generation will lay the material foundation, it will be the quickest and surest way for enabling later generations to succeed in the cultivation of the fine arts, and to surround themselves with some of the luxuries of life, if desired. What the race most needs now, in my opinion, is a whole army of men and women well-trained to lead, and at the same time devote themselves to agriculture, mechanics, domestic employment, and business. As to the mental training that these educated leaders should be equipped with, I should say, give them all the mental training and culture that the circumstances of individuals will allow,--the more the better. No race can permanently succeed until its mind is awakened and strengthened by the ripest thought. But I would constantly have it kept in the minds of those who are educated in books that a large proportion of those who are educated should be so trained in hand that they can bring this mental strength and knowledge to bear upon the physical conditions in the South, which I have tried to emphasize.

Frederick Douglass, of sainted memory, once, in addressing his race, used these words: "We are to prove that we can better our own condition. One way to do this is to accumulate property. This may sound to you like a new gospel. You have been accustomed to hear that money is the root of all evil, etc.; on the other hand, property, money, if you please, will purchase for us the only

condition by which any people can rise to the dignity of genuine manhood; for without property there can be no leisure, without leisure there can be no thought, without thought there can be no invention, without invention there can be no progress."

The Negro should be taught that material development is not an end, but merely a means to an end. As professor W. E. B. Du Bois puts it, the idea should not be simply to make men carpenters, but to make carpenters men. The Negro has a highly religious temperament; but what he needs more and more is to be convinced of the importance of weaving his religion and morality into the practical affairs of daily life. Equally does he need to be taught to put so much intelligence into his labor that he will see dignity and beauty in the occupation, and love it for its own sake. The Negro needs to be taught to apply more of the religion that manifests itself in his happiness in prayer meeting to the performance of his daily task. The man who owns a home, and is in the possession of the elements by which he is sure of a daily living, has a great aid to a moral and religious life. What bearing will all this have upon the Negro's place in the South, as a citizen and in the enjoyment of the privileges which our government confers?

To state in detail just what place the black man will occupy in the South as a citizen, when he has developed in the direction named, is beyond the wisdom of any one. Much will depend upon the sense of justice which can be kept alive in the breast of the American people; almost as much will depend upon the good sense of the Negro himself. That question, I confess, does not give me the most concern just now. The important and pressing question is, Will the Negro, with his own help and that of his friends, take advantage of the opportunities that surround him? When he has done this, I believe, speaking of his future in general terms, that he will be treated with justice, be given the protection of the law and the recognition which his usefulness and ability warrant. If, fifty years ago, one had predicted that the Negro would receive the recognition and honor which individuals have already received, he would have been laughed at as an idle dreamer. Time, patience, and constant achievement are great factors in the rise of a race.

I do not believe that the world ever takes a race seriously, in its desire to share in the government of a nation, until a large number of individual members of that race have demonstrated beyond question their ability to control and develop their own business enterprises. Once a number of Negroes rise to the point where they own and operate the most successful farms, are among the largest taxpayers in their county, are moral and intelligent, I do not believe that in many portions of the South such men need long be denied the right of saying by their votes how they prefer their property to be taxed, and who are to make and administer the laws.

I was walking the street of a certain town in the South lately in company with the most prominent Negro there. While we were together, the mayor of the town sought out the black man, and said, "Next week we are going to vote on the question of issuing bonds to secure water-works; you must be sure to vote on the day of election." The mayor did not suggest whether he should vote yes or no; but he knew that the very fact of this Negro's owning nearly a block of the most valuable property in the town was a guarantee that he would cast a safe, wise vote on this important proposition. The white man knew that because of this Negro's property interests he would cast his vote in the way he thought would benefit every white and black citizen in the town, and not be controlled by influences a thousand miles away. But a short time ago I read letters from nearly every prominent white man in Birmingham, Alabama, asking that the Rev. W. R. Pettiford, a Negro, be appointed to a certain important federal office. What is the explanation of this? For nine years Mr. Pettiford has been the president of the Negro bank in Birmingham, to which I have alluded. During these nine years, the white citizens have had the opportunity of seeing that Mr. Pettiford can manage successfully a private business, and that he has proved himself a conservative, thoughtful citizen, and they are willing to trust him in a public office. Such individual examples will have to be multiplied, till they become more nearly the rule than the exception they now are. While we are multiplying these examples, the Negro must keep a strong and courageous heart. He cannot improve his condition by any short-cut course or by artificial methods. Above all, he must not be deluded into believing that his condition can be permanently bettered by a mere battledoor [sic] and shuttlecock of words, or by any process of mere mental gymnastics or oratory. What is desired along with a logical defense of his cause are deeds, results,--continued results, in the direction of building himself up, so as to leave no doubt in the mind of any one of his ability to succeed.

An important question often asked is, Does the white man in the South want the Negro to improve his present condition? I say yes. From the Montgomery (Alabama) Daily Advertiser I clip the following in reference to the closing of a colored school in a town in Alabama:--

"EUFALA, May 25, 1899. The closing exercises of the city colored public school were held at St. Luke's A. M. E. Church last night, and were witnessed by a large gathering, including many whites. The recitations by the pupils were excellent, and the music was also an interesting feature. Rev. R. T. Pollard delivered the address, which was quite an able one, and the certificates were

presented by Professor T. L. McCoy, white, of the Sanford Street School. The success of the exercises reflects great credit on Professor S. M. Murphy, the principal, who enjoys a deserved good reputation as a capable and efficient educator."

I quote this report, not because it is the exception, but because such marks of interest in the education of the Negro on the part of the Southern white people may be seen almost every day in the local papers. Why should white people, by their presence, words, and actions, encourage the black man to get education, if they do not desire him to improve his condition?

The Payne Institute, an excellent college, to which I have already referred, is supported almost wholly by the Southern white Methodist church. The Southern white Presbyterians support a theological school for Negroes at Tuscaloosa. For a number of years the Southern white Baptists have contributed toward Negro education. Other denominations have done the same. If these people do not want the Negro educated to a higher standard, there is no reason why they should pretend they do.

Though some of the lynchings in the South have indicated a barbarous feeling toward Negroes, Southern white men here and there, as well as newspapers, have spoken out strongly against lynching. I quote from the address of the Rev. Mr. Vance, of Nashville, Tennessee, delivered before the National Sunday School Union, in Atlanta, not long since, as an example:--

"And yet, as I stand here to-night, a Southerner speaking for my section and addressing an audience from all sections, there is one foul blot upon the fair fame of the South, at the bare mention of which the heart turns sick and the cheek is crimsoned with shame. I want to lift my voice to-night in loud and long and indignant protest against the awful horror of mob violence, which the other day reached the climax of its madness and infamy in a deed as black and brutal and barbarous as can be found in the annals of human crime.

"I have a right to speak on the subject, and I propose to be heard. The time has come for every lover of the South to set the might of an angered and resolute manhood against the shame and peril of the lynch demon. These people whose fiendish glee taunts their victim as his flesh crackles in the flames do not represent the South. I have not a syllable of apology for the sickening crime they meant to avenge. But it is high time we were learning that lawlessness is no remedy for crime. For one, I dare to believe that the people of my section are able to cope with crime, however treacherous and defiant, through their courts of justice; and I plead for the masterful sway of a righteous and exalted public sentiment that shall class lynch law in the category with crime."

It is a notable and encouraging fact that no Negro educated in any of our larger institutions of learning in the South has been charged with any of the recent crimes connected with assaults upon women.

If we go on making progress in the directions that I have tried to indicate, more and more the South will be drawn to one course. As I have already said, it is not to the best interests of the white race of the South that the Negro be deprived of any privilege guaranteed him by the Constitution of the United States. This would put upon the South a burden under which no government could stand and prosper. Every article in our Federal Constitution was placed there with a view of stimulating and encouraging the highest type of citizenship. To continue to tax the Negro without giving him the right to vote, as fast as he qualifies himself in education and property for voting, would insure the alienation of the affections of the Negro from the state in which he lives, and would be the reversal of the fundamental principles of government for which our states have stood. In other ways than this the injury would be as great to the white man as to the Negro. Taxation without the hope of becoming voters would take away from one third of the citizens of the Gulf states their interest in government, and a stimulus to become taxpayers or to secure education, and thus be able and willing to bear their share of the cost of education and government, which now rests so heavily upon the white taxpayers of the South. The more the Negro is stimulated and encouraged, the sooner will he be able to bear a larger share of the burdens of the South. We have recently had before us an example, in the case of Spain, of a government that left a large portion of its citizens in ignorance, and neglected their highest interests.

As I have said elsewhere: "There is no escape, through law of man or God, from the inevitable.

'The laws of changeless justice bind Oppressor with oppressed; And close as sin and suffering joined We march to fate abreast.'

Nearly sixteen millions of hands will aid you in pulling the load upwards, or they will pull the load downwards against you. We shall constitute one third and more of the ignorance and crime of the South, or one third of its intelligence and progress; we shall contribute one third to the business and industrial prosperity of the South, or we shall prove a veritable body of death, stagnating, depressing, retarding every effort to advance the body politic."

My own feeling is that the South will gradually reach the point where it will see the wisdom and the justice of enacting an educational or property qualification, or both, for voting, that shall be made to apply honestly to both races. The industrial development of the Negro in connection with education and Christian character will help to hasten this end. When this is done, we shall have a foundation, in my opinion, upon which to build a government that is honest, and that will be in a high degree satisfactory to both races.

I do not suffer myself to take too optimistic a view of the conditions in the South. The problem is a large and serious one, and will require the patient help, sympathy, and advice of our most patriotic citizens, North and South, for years to come. But I believe that if the principles which I have tried to indicate are followed, a solution of the question will come. So long as the Negro is permitted to get education, acquire property, and secure employment, and is treated with respect in the business world, as is now true in the greater part of the South, I shall have the greatest faith in his working out his own destiny in our Southern states. The education and preparation for citizenship of nearly eight millions of people is a tremendous task, and every lover of humanity should count it a privilege to help in the solution of a problem for which our whole country is responsible.

HOT-FOOT HANNIBAL by Charles W. Chesnutt

"I hate and despise you! I wish never to see you or speak to you again!"

"Very well; I will take care that henceforth you have no opportunity to do either."

These words--the first in the passionately vibrant tones of my sister-in-law, and the latter in the deeper and more restrained accents of an angry man--startled me from my nap. I had been dozing in my hammock on the front piazza, behind the honeysuckle vine. I had been faintly aware of a buzz of conversation in the parlor, but had not at all awakened to its import until these sentences fell, or, I might rather say, were hurled upon my ear. I presume the young people had either not seen me lying there,--the Venetian blinds opening from the parlor windows upon the piazza were partly closed on account of the heat,--or else in their excitement they had forgotten my proximity.

I felt somewhat concerned. The young man, I had remarked, was proud, firm, jealous of the point of honor, and, from my observation of him, quite likely to resent to the bitter end what he deemed a slight or an injustice. The girl, I knew, was quite as high-spirited as young Murchison. I feared she was not so just, and hoped she would prove more yielding. I knew that her affections were strong and enduring, but that her temperament was capricious, and her sunniest moods easily overcast by some small cloud of jealousy or pique. I had never imagined, however, that she was capable of such intensity as was revealed by these few words of hers. As I say, I felt concerned. I had learned to like Malcolm Murchison, and had heartily consented to his marriage with my ward; for it was in that capacity that I had stood for a year or two to my wife's younger sister, Mabel. The match thus rudely broken off had promised to be another link binding me to the kindly Southern people among whom I had not long before taken up my residence.

Young Murchison came out of the door, cleared the piazza in two strides without seeming aware of my presence, and went off down the lane at a furious pace. A few moments later Mabel began playing the piano loudly, with a touch that indicated anger and pride and independence and a dash of exultation, as though she were really glad that she had driven away forever the young man whom the day before she had loved with all the ardor of a first passion.

I hoped that time might heal the breach and bring the two young people together again. I told my wife what I had overheard. In return she gave me Mabel's version of the affair.

"I do not see how it can ever be settled," my wife said. "It is something more than a mere lovers' quarrel. It began, it is true, because she found fault with him for going to church with that hateful Branson girl. But before it ended there were things said that no woman of any spirit could stand. I am afraid it is all over between them."

I was sorry to hear this. In spite of the very firm attitude taken by my wife and her sister, I still hoped that the quarrel would be made up within a day or two. Nevertheless, when a week had passed with no word from young Murchison, and with no sign of relenting on Mabel's part, I began to think myself mistaken.

One pleasant afternoon, about ten days after the rupture, old Julius drove the rockaway up to the piazza, and my wife, Mabel, and I took our seats for a drive to a neighbor's vineyard, over on the Lumberton plankroad.

"Which way shall we go," I asked,--"the short road or the long one?"

"I guess we had better take the short road," answered my wife. "We will get there sooner."

"It's a mighty fine dribe roun' by de big road, Mis' Annie," observed Julius, "en it doan take much longer to git dere."

"No," said my wife, "I think we will go by the short road. There is a bay tree in blossom near the mineral spring, and I wish to get some of the flowers."

"I 'spec's you'd find some bay trees 'long de big road, ma'am," said Julius.

"But I know about the flowers on the short road, and they are the ones I want."

We drove down the lane to the highway, and soon struck into the short road leading past the mineral spring. Our route lay partly through a swamp, and on each side the dark, umbrageous foliage, unbroken by any clearing, lent to the road solemnity, and to the air a refreshing coolness. About half a mile from the house, and about halfway to the mineral spring, we stopped at the tree of which my wife had spoken, and reaching up to the low-hanging boughs I gathered a dozen of the fragrant white flowers. When I resumed my seat in the rockaway, Julius started the mare. She went on for a few rods, until we had reached the edge of a branch crossing the road, when she stopped short.

"Why did you stop, Julius?" I asked.

"I didn', suh," he replied. "'T wuz de mare stop'. G' 'long dere, Lucy! W'at you mean by dis foolis'ness?"

Julius jerked the reins and applied the whip lightly, but the mare did not stir.

"Perhaps you had better get down and lead her," I suggested. "If you get her started, you can cross on the log and keep your feet dry."

Julius alighted, took hold of the bridle, and vainly essayed to make the mare move. She planted her feet with even more evident obstinacy.

"I don't know what to make of this," I said. "I have never known her to balk before. Have you, Julius?"

"No, suh," replied the old man, "I nebber has. It's a cu'ous thing ter me, suh."

"What's the best way to make her go?"

"I 'spec's, suh, dat ef I'd tu'n her roun' she'd go de udder way."

"But we want her to go this way."

"Well, suh, I 'low ef we des set heah fo' er fibe minutes, she'll sta't up by herse'f."

"All right," I rejoined, "it is cooler here than any place I have struck to-day. We'll let her stand for a while, and see what she does."

We had sat in silence for a few minutes, when Julius suddenly ejaculated, "Uh huh! I knows w'y dis mare doan go. It des flash 'cross my reccommemb'ance."

"Why is it, Julius?" I inquired.

"Ca'se she sees Chloe."

"Where is Chloe?" I demanded.

"Chloe's done be'n dead dese fo'ty years er mo'," the old man returned. "Her ha'nt is settin' ober yander on de udder side er de branch, unner dat willer tree, dis blessed minute."

"Why, Julius!" said my wife, "do you see the haunt?"

"No'm," he answered, shaking his head, "I doan see 'er, but de mare sees 'er."

"How do you know?" I inquired.

"Well, suh, dis yer is a gray hoss, en dis yer is a Friday; en a gray hoss kin alluz see a ha'nt w'at walks on Friday."

"Who was Chloe?" said Mabel.

"And why does Chloe's haunt walk?" asked my wife.

"It's all in de tale, ma'am," Julius replied, with a deep sigh. "It's all in de tale."

"Tell us the tale," I said. "Perhaps, by the time you get through, the haunt will go away and the mare will cross."

I was willing to humor the old man's fancy. He had not told us a story for some time; and the dark and solemn swamp around us; the amber-colored stream flowing silently and sluggishly at our feet, like the waters of Lethe; the heavy, aromatic scent of the bays, faintly suggestive of funeral wreaths,--all made the place an ideal one for a ghost story.

"Chloe," Julius began in a subdued tone, "use' ter b'long ter ole Mars' Dugal' McAdoo--my ole marster. She wuz a ladly gal en a smart gal, en ole mis' tuk her up ter de big house, en l'arnt her ter wait on de w'ite folks, 'tel bimeby she come ter be mis's own maid, en 'peared ter 'low she run de house herse'f, ter heah her talk erbout it. I wuz a young boy den, en use' ter wuk about de stables, so I knowed ev'ythin' dat wuz gwine on roun' de plantation.

"Well, one time Mars' Dugal' wanted a house boy, en sont down ter de qua'ters fer hab Jeff en Hannibal come up ter de big house nex' mawnin'. Ole marster en ole mis' look' de two boys ober, en 'sco'sed wid deyse'ves fer a little w'ile, en den Mars' Dugal' sez, sezee:--

"'We laks Hannibal de bes', en we gwine ter keep him. Heah, Hannibal, you'll wuk at de house fum now on. En ef you're a good nigger en min's yo' bizness, I'll gib you Chloe fer a wife nex' spring. You other nigger, you Jeff, you kin go back ter de qua'ters. We ain' gwine ter need you.'

"Now Chloe had be'n standin' dere behin' ole mis' dyoin' all er dis yer talk, en Chloe made up her min' fum de ve'y fus' minute she sot eyes on dem two dat she didn' lak dat nigger Hannibal, en wa'n't nebber gwine keer fer 'im, en she wuz des ez sho' dat she lak Jeff, en wuz gwine ter set sto' by 'im, whuther Mars' Dugal' tuk 'im in de big house er no; en so co'se Chloe wuz monst'us sorry w'en ole Mars' Dugal' tuk Hannibal en sont Jeff back. So she slip' roun' de house en waylaid Jeff on de way back ter de qua'ters en tol' 'im not ter be downhea'ted, fer she wuz gwine ter see ef she couldn' fin' some way er 'nuther ter git rid er dat nigger Hannibal, en git Jeff up ter de house in his place.

"De noo house boy kotch on monst'us fas', en it wa'n't no time ha'dly befo' Mars' Dugal' en ole mis' bofe 'mence' ter 'low Hannibal wuz de bes' house boy dey eber had. He wuz peart en soopl', quick ez lightnin', en sha'p ez a razor. But Chloe didn' lak his ways. He wuz so sho' he wuz gwine ter git 'er in de spring, dat he didn' 'pear ter 'low he had ter do any co'tin', en w'en he'd run 'cross Chloe 'bout de house, he'd swell roun' 'er in a biggity way en say:

"'Come heah en kiss me, honey. You gwine ter be mine in de spring. You doan 'pear ter be ez fon' er me ez you oughter be.'

"Chloe didn' keer nuffin' fer Hannibal, en hadn' keered nuffin' fer 'im, en she sot des ez much sto' by Jeff ez she did de day she fus' laid eyes on 'im. En de mo' fermilyus dis yer Hannibal got, de mo' Chloe let her min' run on Jeff, en one ebenin' she went down ter de qua'ters en watch', 'tel she got a chance fer ter talk wid 'im by hisse'f. En she tol' Jeff fer ter go down en see ole Aun' Peggy, de cunjuh-'oman down by de Wim'l'ton Road, en ax her fer ter gib 'im sump'n ter he'p git Hannibal out'n de big house, so de w'ite folks 'u'd sen' fer Jeff ag'in. En bein' ez Jeff didn' hab nuffin' ter gib Aun' Peggy, Chloe gun i'm a silber dollah en a silk han'kercher fer ter pay her wid, fer Aun' Peggy nebber lak ter wuk fer nobody fer nuffin'.

"So Jeff slip' off down ter Aun' Peggy's one night, en gun 'er de presents he brung, en tol' er all 'bout 'im en Chloe en Hannibal, en ax' 'er ter he'p 'im out. Aun' Peggy tol' 'im she'd wuk 'er roots, en fer 'im ter come back de nex' night, en she'd tell 'im w'at she c'd do fer 'im.

"So de nex' night Jeff went back, en Aun' Peggy gun 'im a baby-doll, wid a body made out'n a piece er co'n-stalk, en wid splinters fer a'ms en legs, en a head made out'n elderberry peth, en two little red peppers fer feet.

"'Dis yer baby-doll,' sez she, 'is Hannibal. Dis yer peth head is Hannibal's head, en dese yer pepper feet is Hannibal's feet. You take dis en hide it unner de house, on de sill unner de do', whar Hannibal'll hafter walk ober it ev'y day. En ez long ez Hannibal comes anywhar nigh dis baby-doll, he'll be des lak it is--light-headed en hot-footed; en ef dem two things doan git 'im inter trouble mighty soon, den I'm no cunjuh-'oman. But w'en you git Hannibal out'n de house, en git all thoo wid dis baby-doll, you mus' fetch it back ter me, fer it's monst'us powerful goopher, en is liable ter make mo' trouble ef you leabe it layin' roun'.'

"Well, Jeff tuk de baby-doll, en slip' up ter de big house, en whistle' ter Chloe, en w'en she come out he tol' 'er w'at ole Aun' Peggy had said. En Chloe showed 'im how ter git unner de house, en w'en he had put de cunjuh-doll on de sill he went 'long back ter de qua'ters--en des waited.

"Nex' day, sho' 'nuff, de goopher 'mence' ter wuk. Hannibal sta'ted in de house soon in de mawnin' wid a armful er wood ter make a fier, en he hadn' mo' d'n got 'cross de do'sill befo' his feet begun ter bu'n so dat he drap' de armful er wood on de flo' en woke ole mis' up an hour sooner'n yuzhal, en co'se ole mis' didn' lak dat, en spoke sha'p erbout it.

"W'en dinner-time come, en Hannibal wuz help'n de cook kyar de dinner f'm de kitchen inter de big house, en wuz gittin' close ter de do' what he had ter go in, his feet sta'ted ter bu'n en his head begun ter swim, en he let de big dish er chicken en dumplin's fall right down in de dirt, in de middle er de ya'd, en de w'ite folks had ter make dey dinner dat day off'n col' ham en sweet pertaters.

"De nex' mawnin' he overslep' hisse'f, en got inter mo' trouble. Atter breakfus', Mars' Dugal' sont 'im ober ter Mars' Marrabo Utley's fer ter borry a monkey wrench. He oughter be'n back in ha'f an hour, but he come pokin' home 'bout dinner'time wid a screw-driver stidder a monkey wrench. Mars' Dugal' sont ernudder nigger back wid de screw-driver, en Hannibal didn' git no dinner. 'Long in de atternoon, ole mis' sot Hannibal ter weedin' de flowers in de front gyahden, en Hannibal dug up all de bulbs ole mis' had sont erway fer, en paid a lot er money fer, en tuk 'em down ter de hawg-pen by de ba'nya'd, en fed 'em ter de hawgs. W'en ole mis' come out in de cool er de ebenin', en seed w'at Hannibal had done, she wuz mos' crazy, en she wrote a note en sont Hannibal down ter de obserseah wid it.

"But w'at Hannibal got fum de oberseah didn' 'pear ter do no good. Ev'y now en den 'is feet'd 'mence ter torment 'im, en 'is min' 'u'd git all mix' up, en his conduc' kep' gittin' wusser en wusser, 'tel fin'ly de w'ite folks couldn' stan' it no longer, en Mars' Dugal' tuk Hannibal back down ter de qua'ters.

"'Mr. Smif,' sez Mars' Dugal' ter de oberseah, 'dis yer nigger has tu'nt out so triflin' yer lately, dat we can't keep 'im at de house no mo', en I's fotch' 'im ter you ter be straighten' up. You's had 'casion ter deal wid 'im once, so he knows w'at ter expec'. You des take 'im in han', en lemme know how he tu'ns out. En w'en de han's comes in fum de fiel' dis ebenin' you kin sen' dat yaller nigger Jeff up ter de house. I'll try 'im, en see ef he's any better'n Hannibal.'

"So Jeff went up ter de big house, en pleas' Mars' Dugal' en ole mis' en de res' er de fambly so well dat dey all got ter lakin' 'im fus'rate, en dey'd 'a' fergot all 'bout Hannibal ef it hadn' be'n fer de bad repo'ts w'at come up fum de qua'ters 'bout 'im fer a mont' er so. Fac' is dat Chloe en Jeff wuz so int'rusted in one ernudder since Jeff be'n up ter de house, dat dey fergot all about takin' de baby-doll back ter Aun' Peggy, en it kep' wukkin fer a w'ile, en makin' Hannibal's feet bu'n mo' er less, 'tel all de folks on de plantation got ter callin' 'im Hot-Foot Hannibal. He kep' gittin' mo' en mo' triflin', 'tel he got de name er bein' de mos' no 'countes' nigger on de plantation, en Mars' Dugal' had ter th'eaten ter sell 'im in de spring; w'en bimeby de goopher quit wukkin', en Hannibal 'mence' ter pick up some en make folks set a little mo' sto' by 'im.

"Now, dis yer Hannibal was a monst'us sma't nigger, en w'en he got rid er dem so' feet his min' kep' runnin' on 'is udder troubles. Heah th'ee er fo' weeks befo' he'd had a' easy job, waitin' on de w'ite folks, libbin off'n de fat er de lan', en promus' de fines' gal on de plantation fer a wife in de spring, en now heah he wuz back in de co'nfiel', wid de oberseah a-cussin' en a r'arin' ef he didn' get a ha'd tas' done; wid nuffin' but co'n bread en bacon en merlasses ter eat; en all de fiel-han's makin' rema'ks, en pokin' fun at 'im ca'se he be'n sont back fum de big house ter de fiel'. En de mo' Hannibal studied 'bout it de mo' madder he got, 'tel he fin'ly swo' he wuz gwine ter git eben wid Jeff en Chloe ef it wuz de las' ac'.

"So Hannibal slipped 'way fum de qua'ters one Sunday en hid in de co'n up close ter de big house, 'tel he see Chloe gwine down de road. He waylaid her, en sezee:--

"'Hoddy, Chloe?'

"'I ain't got no time fer ter fool wid fiel'-han's,' sez Chloe, tossin' her head; 'W'at you want wid me, Hot-Foot?'

"'I wants ter know how you en Jeff is gittin' 'long.'

"'I 'lows dat's none er yo' bizness, nigger. I doan see w'at 'casion any common fiel'-han' has got ter mix in wid de 'fairs er folks w'at libs in de big house. But ef it'll do you any good ter know, I mought say dat me en Jeff is gittin' 'long mighty well, en we gwine ter git married in de spring, en you ain' gwine ter be 'vited ter de weddin' nuther.'

'"No, no!' sezee, 'I wouldn' 'spec' ter be 'vited ter de weddin',--a common, low-down fiel'-han' lak I is. But I's glad ter heah you en Jeff is gittin' 'long so well. I didn' knowed but w'at he had 'mence' ter be a little ti'ed.'

'"Ti'ed er me? Dat's rediklus!' sez Chloe. 'W'y, dat nigger lubs me so I b'liebe he'd go th'oo fier en water fer me. Dat nigger is des wrop' up in me.'

'"Uh huh,' sez Hannibal, 'den I reckon is mus' be some udder nigger w'at meets a 'oman down by de crick in de swamp ev'y Sunday ebenin', ter say nuffin' 'bout two er th'ee times a week.'

'"Yas, hit is ernudder nigger, en you is a liah w'en you say it wuz Jeff.'

'"Mebbe I is a liah, en mebbe I ain' got good eyes. But 'less'n I IS a liah, en 'less'n I AIN' got good eyes, Jeff is gwine ter meet dat 'oman dis ebenin' long 'bout eight o'clock right down dere by de crick in de swamp 'bout halfway betwix' dis plantation en Mars' Marrabo Utley's.'

"Well, Chloe tol' Hannibal she didn' b'liebe a wud he said, en call' 'im a low-down nigger who wuz tryin' ter slander Jeff 'ca'se he wuz mo' luckier'n he wuz. But all de same, she couldn' keep her min' fum runnin' on w'at Hannibal had said. She 'membered she'd heared one er de niggers say dey wuz a gal ober at Mars' Marrabo Utley's plantation w'at Jeff use' ter go wid some befo' he got 'quainted wid Chloe. Den she 'mence' ter figger back, en sho' 'nuff, dey wuz two er th'ee times in de las' week w'en she'd be'n he'p'n de ladies wid dey dressin' en udder fixin's in de ebenin', en Jeff mought 'a' gone down ter de swamp widout her knowin' 'bout it at all. En den she 'mence' ter 'member little things w'at she hadn' tuk no notice of befo', en w'at 'u'd make it 'pear lak Jeff had sump'n on his min'.

"Chloe set a monst'us heap er sto' by Jeff, en would 'a' done mos' anythin' fer 'im, so long ez he stuck ter her. But Chloe wuz a mighty jealous 'oman, en w'iles she didn' b'liebe w'at Hannibal said, she seed how it COULD 'a' be'n so, en she 'termine' fer ter fin' out fer herse'f whuther it WUZ so er no.

"Now, Chloe hadn' seed Jeff all day, fer Mars' Dugal' had sont Jeff ober ter his daughter's house, young Mis' Ma'g'ret's, w'at libbed 'bout fo' miles fum Mars' Dugal's, en Jeff wuzn' 'spected home 'tel ebenin'. But des atter supper wuz ober, en w'iles de ladies wuz settin' out on de piazzer, Chloe slip' off fum de house en run down de road,--dis yer same road we come; en w'en she got mos' ter de crick--dis yer same crick right befo' us--she kin' er kip' in de bushes at de side er de road, 'tel fin'ly she seed Jeff settin' on de back on de udder side er de crick,--right under dat ole willer tree droopin' ober de watah yander. En ev'y now en den he'd git up en look up de road to'ds Mars' Marrabo's on de udder side er de swamp.

"Fus' Chloe felt lak she'd go right ober de crick en gib Jeff a piece er her min'. Den she 'lowed she better be sho' befo' she done anythin'. So she helt herse'f in de bes' she could, gittin' madder en madder ev'ry minute, 'tel bimeby she seed a 'oman comin' down de road on de udder side fum to'ds Mars' Marrabo Utley's plantation. En w'en she seed Jeff jump up en run to'ds dat 'oman, en th'ow his a'ms roun' her neck, po' Chloe didn' stop ter see no mo', but des tu'nt roun' en run up ter de house, en rush' up on de piazzer, en up en tol' Mars' Dugal' en ole mis' all 'bout de baby-doll, en all 'bout Jeff gittin' de goopher fum Aun' Peggy, en 'bout w'at de goopher had done ter Hannibal.

"Mars' Dugal' wuz monst'us mad. He didn' let on at fus' lak he b'liebed Chloe, but w'en she tuk en showed 'im whar ter fin' de baby-doll, Mars' Dugal' tu'nt w'ite ez chalk.

'"What debil's wuk is dis?' sezee. 'No wonder de po' nigger's feet eetched. Sump'n got ter be done ter l'arn dat ole witch ter keep her han's off'n my niggers. En ez fer dis yer Jeff, I'm gwine ter do des w'at I promus', so de darkies on dis plantation'll know I means w'at I sez.'

"Fer Mars' Dugal' had warned de han's befo' 'bout foolin' wid cunju'ation; fac', he had los' one er two niggers hisse'f fum dey bein' goophered, en he would 'a' had ole Aun' Peggy whip' long ago, on'y Aun' Peggy wuz a free 'oman, en he wuz 'feard she'd cunjuh him. En wi'les Mars' Dugal' say he didn' b'liebe in cunj'in' en sich, he 'peared ter 'low it wuz bes' ter be on de safe side, en let Aun' Peggy alone.

"So Mars' Dugal' done des ez he say. Ef ole mis' had ple'd fer Jeff he mought 'a' kep' 'im. But ole mis' hadn' got ober losin' dem bulbs yit, en she nebber said a wud. Mars' Dugal' tuk Jeff ter town nex' day en' sol' 'im ter a spekilater, who sta'ted down de ribber wid 'im nex' mawnin' on a steamboat, fer ter take 'im ter Alabama.

"Now, w'en Chloe tol' ole Mars' Dugal' 'bout dis yer baby-doll en dis udder goopher, she hadn' ha'dly 'lowed Mars' Dugal' would sell Jeff down Souf. Howsomeber, she wuz so mad wid Jeff dat she 'suaded herse'f she didn' keer; en so she hilt her head up en went roun' lookin' lak she wuz rale glad 'bout it. But one day she wuz walkin' down de road, w'en who sh'd come 'long but dis yer Hannibal.

"W'en Hannibal seed 'er he bus' out laffin' fittin' fer ter kill: 'Yah, yah, yah! ho, ho, ho! ha, ha, ha! Oh, hol' me, honey, hol' me, er I'll laf myse'f ter def. I ain' nebber laf' so much sence I be'n bawn.'

"'W'at you laffin' at, Hot-Foot?'

"'Yah, yah, yah! W'at I laffin' at? W'y, I's laffin' at myse'f, tooby sho',--laffin' ter think w'at a fine 'oman I made.'

"Chloe tu'nt pale, en her hea't come up in her mouf.

"'W'at you mean, nigger?' sez she, ketchin' holt er a bush by de road fer ter stiddy herse'f. 'W'at you mean by de kin' er 'oman you made?'

"W'at do I mean? I means dat I got squared up wid you fer treatin' me de way you done, en I got eben wid dat yaller nigger Jeff fer cuttin' me out. Now, he's gwine ter know w'at it is ter eat co'n bread en merlasses once mo', en wuk fum daylight ter da'k, en ter hab a oberseah dribin' 'im fum one day's een' ter de udder. I means dat I sont wud ter Jeff dat Sunday dat you wuz gwine ter be ober ter Mars' Marrabo's visitin' dat ebenin', en you want i'm ter meet you down by de crick on de way home en go de rest er de road wid you. En den I put on a frock en a sun-bonnet en fix' myse'f up ter look lak a 'oman; en w'en Jeff seed me comin' he run ter meet me, en you seed 'im,--fer I had be'n watchin' in de bushes befo' en 'skivered you comin' down de road. En now I reckon you en Jeff bofe knows w'at it means ter mess wid a nigger lak me.'

"Po' Chloe hadn' heared mo' d'n half er de las' part er w'at Hannibal said, but she had heared 'nuff to l'arn dat dis nigger had fooler her en Jeff, en dat po' Jeff hadn' done nuffin', en dat fer lovin' her too much en goin' ter meet her she had cause' 'im ter be sol' erway whar she'd nebber, nebber see 'im no mo'. De sun mought shine by day, de moon by night, de flowers mought bloom, en de mawkin'-birds mought sing, but po' Jeff wuz done los' ter her fereber en fereber.

"Hannibal hadn' mo' d'n finish' w'at he had ter say, w'en Chloe's knees gun 'way unner her, en she fell down in de road, en lay dere half a' hour er so befo' she come to. W'en she did, she crep' up ter de house des ez pale ez a ghos'. En fer a mont' er so she crawled roun' de house, en 'peared ter be so po'ly dat Mars' Dugal' sont fer a doctor; en de doctor kep' on axin' her questions 'tel he foun' she wuz des pinin' erway fer Jeff.

"W'en he tol' Mars' Dugal', Mars' Dugal' lafft, en said he'd fix dat. She could hab de noo house boy fer a husban'. But ole mis' say, no, Chloe ain' dat kinder gal, en dat Mars' Dugal' should buy Jeff back.

"So Mars' Dugal' writ a letter ter dis yer spekilater down ter Wim'l'ton, en tol' ef he ain' done sol' dat nigger Souf w'at he bought fum 'im, he'd lak ter buy 'm back ag'in. Chloe 'mence' ter pick up a little w'en ole mis' tol' her 'bout dis letter. Howsomeber, bimeby Mars' Dugal' got a' answer fum de spekilater, who said he wuz monst'us sorry, but Jeff had fell ove'boa'd er jumped off'n de steamboat on de way ter Wim'l'ton, en got drownded, en co'se he couldn' sell 'im back, much ez he'd lak ter 'bleedge Mars' Dugal'.

"Well, atter Chloe heared dis she pu'tended ter do her wuk, en ole mis' wa'n't much mo' use ter nobody. She put up wid her, en hed de doctor gib her medicine, en let 'er go ter de circus, en all so'ts er things fer ter take her min' off'n her troubles. But dey didn' none un 'em do no good. Chloe got ter slippin' down here in de ebenin' des lak she 'uz comin' ter meet Jeff, en she'd set dere unner dat willer tree on de udder side, en wait fer 'im, night atter night. Bimeby she got so bad de w'ite folks sont her ober ter young Mis' Ma'g'ret's fer ter gib her a change; but she runned erway de fus' night, en w'en dey looked fer 'er nex' mawnin' dey foun' her co'pse layin' in de branch yander, right 'cross fum whar we're settin' now.

"Eber sence den," said Julius in conclusion, "Chloe's ha'nt comes eve'y ebenin' en sets down unner dat willer tree en waits fer Jeff, er e'se walks up en down de road yander, lookin' en lookin', en' [sic] waitin' en waitin', fer her sweethea't w'at ain' nebber, nebber come back ter her no mo'."

There was silence when the old man had finished, and I am sure I saw a tear in my wife's eye, and more than one in Mabel's.

"I think, Julius," said my wife after a moment, "that you may turn the mare around and go by the long road."

The old man obeyed with alacrity, and I noticed no reluctance on the mare's part.

"You are not afraid of Chloe's haunt, are you?" I asked jocularly.

My mood was not responded to, and neither of the ladies smiled.

"Oh no," said Annie, "but I've changed my mind. I prefer the other route."

When we had reached the main road and had proceeded along it for a short distance, we met a cart driven by a young negro, and on the cart were a trunk and a valise. We recognized the man as Malcolm Murchison's servant, and drew up a moment to speak to him.

"Who's going away, Marshall?" I inquired.

"Young Mistah Ma'colm gwine 'way on de boat ter Noo Yo'k dis ebenin', suh, en I'm takin' his things down ter de wharf, suh."

This was news to me, and I heard it with regret. My wife looked sorry, too, and I could see that Mabel was trying hard to hide her concern.

"He's comin' 'long behin', suh, en I 'spec's you'll meet 'im up de road a piece. He's gwine ter walk down ez fur ez Mistah Jim Williams's, en take de buggy fum dere ter town. He 'spec's ter be gone a long time, suh, en say prob'ly he ain' nebber comin' back."

The man drove on. There were a few words exchanged in an undertone between my wife and Mabel, which I did not catch. Then Annie said: "Julius, you may stop the rockaway a moment. There are some trumpet-flowers by the road there that I want. Will you get them for me, John?"

I sprang into the underbrush, and soon returned with a great bunch of scarlet blossoms.

"Where is Mabel?" I asked, noting her absence.

"She has walked on ahead. We shall overtake her in a few minutes."

The carriage had gone only a short distance when my wife discovered that she had dropped her fan.

"I had it where we were stopping. Julius, will you go back and get it for me?"

Julius got down and went back for the fan. He was an unconscionably long time finding it. After we got started again we had gone only a little way, when we saw Mabel and young Murchison coming toward us. They were walking arm in arm, and their faces were aglow with the light of love.

I do not know whether or not Julius had a previous understanding with Malcolm Murchison by which he was to drive us round by the long road that day, nor do I know exactly what motive influenced the old man's exertions in the matter. He was fond of Mabel, but I was old enough, and knew Julius well enough, to be skeptical of his motives. It is certain that a most excellent understanding existed between him and Murchison after the reconciliation, and that when the young people set up housekeeping over at the old Murchison place Julius had an opportunity to enter their service. For some reason or other, however, he preferred to remain with us. The mare, I might add, was never known to balk again.

A NEGRO SCHOOLMASTER IN THE NEW SOUTH by W. E. Burghardt Du Bois

Once upon a time I taught school in the hills of Tennessee, where the broad dark vale of the Mississippi begins to roll and crumple to greet the Alleghanies. I was a Fisk student then, and all Fisk men think that Tennessee--beyond the Veil--is theirs alone, and in vacation time they sally forth in lusty bands to meet the county school commissioners. Young and happy, I too went, and I shall not soon forget that summer, ten years ago.

First, there was a teachers' Institute at the county-seat; and there distinguished guests of the superintendent taught the teachers fractions and spelling and other mysteries,--white teachers in the morning, Negroes at night. A picnic now and then, and a supper, and the rough world was softened by laughter and song. I remember how--But I wander.

There came a day when all the teachers left the Institute, and began the hunt for schools. I learn from hearsay (for my mother was mortally afraid of firearms) that the hunting of ducks and bears and men is wonderfully interesting, but I am sure that the man who

has never hunted a country school has something to learn of the pleasures of the chase. I see now the white, hot roads lazily rise and fall and wind before me under the burning July sun; I feel the deep weariness of heart and limb, as ten, eight, six miles stretch relentlessly ahead; I feel my heart sink heavily as I hear again and again, "Got a teacher? Yes." So I walked on and on,--horses were too expensive,--until I had wandered beyond railways, beyond stage lines, to a land of "varmints" and rattlesnakes, where the coming of a stranger was an event, and men lived and died in the shadow of one blue hill.

Sprinkled over hill and dale lay cabins and farmhouses, shut out from the world by the forests and the rolling hills toward the east. There I found at last a little school. Josie told me of it; she was a thin, homely girl of twenty, with a dark brown face and thick, hard hair. I had crossed the stream at Watertown, and rested under the great willows; then I had gone to the little cabin in the lot where Josie was resting on her way to town. The gaunt farmer made me welcome, and Josie, hearing my errand, told me anxiously that they wanted a school over the hill; that but once since the war had a teacher been there; that she herself longed to learn,--and thus she ran on, talking fast and loud, with much earnestness and energy.

Next morning I crossed the tall round hill, lingered to look at the blue and yellow mountains stretching toward the Carolinas; then I plunged into the wood, and came out at Josie's home. It was a dull frame cottage with four rooms, perched just below the brow of the hill, amid peach trees. The father was a quiet, simple soul, calmly ignorant, with no touch of vulgarity. The mother was different,--strong, bustling, and energetic, with a quick, restless tongue, and an ambition to live "like folks." There was a crowd of children. Two boys had gone away. There remained two growing girls; a shy midget of eight; John, tall, awkward, and eighteen; Jim, younger, quicker, and better looking; and two babies of indefinite age. Then there was Josie herself. She seemed to be the centre of the family: always busy at service or at home, or berry-picking; a little nervous and inclined to scold, like her mother, yet faithful, too, like her father. She had about her a certain fineness, the shadow of an unconscious moral heroism that would willingly give all of life to make life broader, deeper, and fuller for her and hers. I saw much of this family afterward, and grew to love them for their honest efforts to be decent and comfortable, and for their knowledge of their own ignorance. There was with them no affectation. The mother would scold the father for being so "easy;" Josie would roundly rate the boys for carelessness; and all knew that it was a hard thing to dig a living out of a rocky side hill.

I secured the school. I remember the day I rode horseback out to the commissioner's house, with a pleasant young white fellow, who wanted the white school. The road ran down the bed of a stream; the sun laughed and the water jingled, and we rode on. "Come in," said the commissioner,--"come in. Have a seat. Yes, that certificate will do. Stay to dinner. What do you want a month?" Oh, thought I, this is lucky; but even then fell the awful shadow of the Veil, for they ate first, then I--alone.

The schoolhouse was a log hut, where Colonel Wheeler used to shelter his corn. It sat in a lot behind a rail fence and thorn bushes, near the sweetest of springs. There was an entrance where a door once was, and within, a massive rickety fireplace; great chinks between the logs served as windows. Furniture was scarce. A pale blackboard crouched in the corner. My desk was made of three boards, reinforced at critical points, and my chair, borrowed from the landlady, had to be returned every night. Seats for the children,--these puzzled me much. I was haunted by a New England vision of neat little desks and chairs, but, alas, the reality was rough plank benches without backs, and at times without legs. They had the one virtue of making naps dangerous,--possibly fatal, for the floor was not to be trusted.

It was a hot morning late in July when the school opened. I trembled when I heard the patter of little feet down the dusty road, and saw the growing row of dark solemn faces and bright eager eyes facing me. First came Josie and her brothers and sisters. The longing to know, to be a student in the great school at Nashville, hovered like a star above this child woman amid her work and worry, and she studied doggedly. There were the Dowells from their farm over toward Alexandria: Fanny, with her smooth black face and wondering eyes; Martha, brown and dull; the pretty girl wife of a brother, and the younger brood. There were the Burkes, two brown and yellow lads, and a tiny haughty-eyed girl. Fat Reuben's little chubby girl came, with golden face and old gold hair, faithful and solemn. 'Thenie was on hand early,--a jolly, ugly, good-hearted girl, who slyly dipped snuff and looked after her little bow-legged brother. When her mother could spare her, 'Tildy came,--a midnight beauty, with starry eyes and tapering limbs; and her brother, correspondingly homely. And then the big boys: the hulking Lawrences; the lazy Neills, unfathered sons of mother and daughter; Hickman, with a stoop in his shoulders; and the rest.

There they sat, nearly thirty of them, on the rough benches, their faces shading from a pale cream to a deep brown, the little feet bare and swinging, the eyes full of expectation, with here and there a twinkle of mischief, and the hands grasping Webster's blue-back spelling-book. I loved my school, and the fine faith the children had in the wisdom of their teacher was truly marvelous. We read and spelled together, wrote a little, picked flowers, sang, and listened to stories of the world beyond the hill. At times the

school would dwindle away, and I would start out. I would visit Mun Eddings, who lived in two very dirty rooms, and ask why little Lugene, whose flaming face seemed ever ablaze with the dark red hair uncombed, was absent all last week, or why I missed so often the inimitable rags of Mack and Ed. Then the father, who worked Colonel Wheeler's farm on shares, would tell me how the crops needed the boys; and the thin, slovenly mother, whose face was pretty when washed, assured me that Lugene must mind the baby. "But we'll start them again next week." When the Lawrences stopped, I knew that the doubts of the old folks about book-learning had conquered again, and so, toiling up the hill, and getting as far into the cabin as possible, I put Cicero pro Archia Poeta into the simplest English with local applications, and usually convinced them--for a week or so.

On Friday nights I often went home with some of the children; sometimes to Doc Burke's farm. He was a great, loud, thin Black, ever working, and trying to buy the seventy-five acres of hill and dale where he lived; but people said that he would surely fail, and the "white folks would get it all." His wife was a magnificent Amazon, with saffron face and shining hair, uncorseted and barefooted, and the children were strong and beautiful. They lived in a one-and-a-half-room cabin in the hollow of the farm, near the spring. The front room was full of great fat white beds, scrupulously neat; and there were bad chromos on the walls, and a tired centre-table. In the tiny back kitchen I was often invited to "take out and help" myself to fried chicken and wheat biscuit, "meat" and corn pone, string beans and berries. At first I used to be a little alarmed at the approach of bed-time in the one lone bedroom, but embarrassment was very deftly avoided. First, all the children nodded and slept, and were stowed away in one great pile of goose feathers; next, the mother and the father discreetly slipped away to the kitchen while I went to bed; then, blowing out the dim light, they retired in the dark. In the morning all were up and away before I thought of awaking. Across the road, where fat Reuben lived, they all went outdoors while the teacher retired, because they did not boast the luxury of a kitchen.

I liked to stay with the Dowells, for they had four rooms and plenty of good country fare. Uncle Bird had a small, rough farm, all woods and hills, miles from the big road; but he was full of tales,--he preached now and then,--and with his children, berries, horses, and wheat he was happy and prosperous. Often, to keep the peace, I must go where life was less lovely; for instance, 'Tildy's mother was incorrigibly dirty, Reuben's larder was limited seriously, and herds of untamed bedbugs wandered over the Eddingses' beds. Best of all I loved to go to Josie's, and sit on the porch, eating peaches, while the mother bustled and talked: how Josie had bought the sewing-machine; how Josie worked at service in winter, but that four dollars a month was "mighty little" wages; how Josie longed to go away to school, but that it "looked like" they never could get far enough ahead to let her; how the crops failed and the well was yet unfinished; and, finally, how "mean" some of the white folks were.

For two summers I lived in this little world; it was dull and humdrum. The girls looked at the hill in wistful longing, and the boys fretted, and haunted Alexandria. Alexandria was "town,"--a straggling, lazy village of houses, churches, and shops, and an aristocracy of Toms, Dicks, and Captains. Cuddled on the hill to the north was the village of the colored folks, who lived in three or four room unpainted cottages, some neat and homelike, and some dirty. The dwellings were scattered rather aimlessly, but they centred about the twin temples of the hamlet, the Methodist and the Hard-Shell Baptist churches. These, in turn, leaned gingerly on a sad-colored schoolhouse. Hither my little world wended its crooked way on Sunday to meet other worlds, and gossip, and wonder, and make the weekly sacrifice with frenzied priest at the altar of the "old-time religion." Then the soft melody and mighty cadences of Negro song fluttered and thundered.

I have called my tiny community a world, and so its isolation made it; and yet there was among us but a half-awakened common consciousness, sprung from common joy and grief, at burial, birth, or wedding; from a common hardship in poverty, poor land, and low wages; and, above all, from the sight of the Veil that hung between us and Opportunity. All this caused us to think some thoughts together; but these, when ripe for speech, were spoken in various languages. Those whose eyes thirty and more years before had seen "the glory of the coming of the Lord" saw in every present hindrance or help a dark fatalism bound to bring all things right in His own good time. The mass of those to whom slavery was a dim recollection of childhood found the world a puzzling thing: it asked little of them, and they answered with little, and yet it ridiculed their offering. Such a paradox they could not understand, and therefore sank into listless indifference, or shiftlessness, or reckless bravado. There were, however, some such as Josie, Jim, and Ben,--they to whom War, Hell, and Slavery were but childhood tales, whose young appetites had been whetted to an edge by school and story and half-awakened thought. Ill could they be content, born without and beyond the World. And their weak wings beat against their barriers,--barriers of caste, of youth, of life; at last, in dangerous moments, against everything that opposed even a whim.

The ten years that follow youth, the years when first the realization comes that life is leading somewhere,--these were the years that passed after I left my little school. When they were past, I came by chance once more to the walls of Fisk University, to the

halls of the chapel of melody. As I lingered there in the joy and pain of meeting old school friends, there swept over me a sudden longing to pass again beyond the blue hill, and to see the homes and the school of other days, and to learn how life had gone with my school-children; and I went.

Josie was dead, and the gray-haired mother said simply, "We've had a heap of trouble since you've been away." I had feared for Jim. With a cultured parentage and a social caste to uphold him, he might have made a venturesome merchant or a West Point cadet. But here he was, angry with life and reckless; and when Farmer Durham charged him with stealing wheat, the old man had to ride fast to escape the stones which the furious fool hurled after him. They told Jim to run away; but he would not run, and the constable came that afternoon. It grieved Josie, and great awkward John walked nine miles every day to see his little brother through the bars of Lebanon jail. At last the two came back together in the dark night. The mother cooked supper, and Josie emptied her purse, and the boys stole away. Josie grew thin and silent, yet worked the more. The hill became steep for the quiet old father, and with the boys away there was little to do in the valley. Josie helped them sell the old farm, and they moved nearer town. Brother Dennis, the carpenter, built a new house with six rooms; Josie toiled a year in Nashville, and brought back ninety dollars to furnish the house and change it to a home.

When the spring came, and the birds twittered, and the stream ran proud and full, little sister Lizzie, bold and thoughtless, flushed with the passion of youth, bestowed herself on the tempter, and brought home a nameless child. Josie shivered, and worked on, with the vision of schooldays all fled, with a face wan and tired,--worked until, on a summer's day, some one married another; then Josie crept to her mother like a hurt child, and slept--and sleeps.

I paused to scent the breeze as I entered the valley. The Lawrences have gone; father and son forever, and the other son lazily digs in the earth to live. A new young widow rents out their cabin to fat Reuben. Reuben is a Baptist preacher now, but I fear as lazy as ever, though his cabin has three rooms; and little Ella has grown into a bouncing woman, and is ploughing corn on the hot hillside. There are babies a plenty, and one half-witted girl. Across the valley is a house I did not know before, and there I found, rocking one baby and expecting another, one of my schoolgirls, a daughter of Uncle Bird Dowell. She looked somewhat worried with her new duties, but soon bristled into pride over her neat cabin, and the tale of her thrifty husband, the horse and cow, and the farm they were planning to buy.

My log schoolhouse was gone. In its place stood Progress, and Progress, I understand, is necessarily ugly. The crazy foundation stones still marked the former site of my poor little cabin, and not far away, on six weary boulders, perched a jaunty board house, perhaps twenty by thirty feet, with three windows and a door that locked. Some of the window glass was broken, and part of an old iron stove lay mournfully under the house. I peeped through the window half reverently, and found things that were more familiar. The blackboard had grown by about two feet, and the seats were still without backs. The county owns the lot now, I hear, and every year there is a session of school. As I sat by the spring and looked on the Old and the New I felt glad, very glad, and yet--

After two long drinks I started on. There was the great double log house on the corner. I remembered the broken, blighted family that used to live there. The strong, hard face of the mother, with its wilderness of hair, rose before me. She had driven her husband away, and while I taught school a strange man lived there, big and jovial, and people talked. I felt sure that Ben and 'Tildy would come to naught from such a home. But this is an odd world; for Ben is a busy farmer in Smith County, "doing well, too," they say, and he had cared for little 'Tildy until last spring, when a lover married her. A hard life the lad had led, toiling for meat, and laughed at because he was homely and crooked. There was Sam Carlon, an impudent old skinflint, who had definite notions about niggers, and hired Ben a summer and would not pay him. Then the hungry boy gathered his sacks together, and in broad daylight went into Carlon's corn; and when the hard-fisted farmer set upon him, the angry boy flew at him like a beast. Doc Burke saved a murder and a lynching that day.

The story reminded me again of the Burkes, and an impatience seized me to know who won in the battle, Doc or the seventy-five acres. For it is a hard thing to make a farm out of nothing, even in fifteen years. So I hurried on, thinking of the Burkes. They used to have a certain magnificent barbarism about them that I liked. They were never vulgar, never immoral, but rather rough and primitive, with an unconventionality that spent itself in loud guffaws, slaps on the back, and naps in the corner. I hurried by the cottage of the misborn Neill boys. It was empty, and they were grown into fat, lazy farm hands. I saw the home of the Hickmans, but Albert, with his stooping shoulders, had passed from the world. Then I came to the Burkes' gate and peered through; the inclosure looked rough and untrimmed, and yet there were the same fences around the old farm save to the left, where lay twenty-five other acres. And lo! the cabin in the hollow had climbed the hill and swollen to a half-finished six-room cottage.

The Burkes held a hundred acres, but they were still in debt. Indeed, the gaunt father who toiled night and day would scarcely be happy out of debt, being so used to it. Some day he must stop, for his massive frame is showing decline. The mother wore shoes, but the lionlike physique of other days was broken. The children had grown up. Rob, the image of his father, was loud and rough with laughter. Birdie, my school baby of six, had grown to a picture of maiden beauty, tall and tawny. "Edgar is gone," said the mother, with head half bowed,--"gone to work in Nashville; he and his father couldn't agree."

Little Doc, the boy born since the time of my school, took me horseback down the creek next morning toward Farmer Dowell's. The road and the stream were battling for mastery, and the stream had the better of it. We splashed and waded, and the merry boy, perched behind me, chattered and laughed. He showed me where Simon Thompson had bought a bit of ground and a home; but his daughter Lana, a plump, brown, slow girl, was not there. She had married a man and a farm twenty miles away. We wound on down the stream till we came to a gate that I did not recognize, but the boy insisted that it was "Uncle Bird's." The farm was fat with the growing crop. In that little valley was a strange stillness as I rode up; for death and marriage had stolen youth, and left age and childhood there. We sat and talked that night, after the chores were done. Uncle Bird was grayer, and his eyes did not see so well, but he was still jovial. We talked of the acres bought,--one hundred and twenty-five,--of the new guest chamber added, of Martha's marrying. Then we talked of death: Fanny and Fred were gone; a shadow hung over the other daughter, and when it lifted she was to go to Nashville to school. At last we spoke of the neighbors, and as night fell Uncle Bird told me how, on a night like that, 'Thenie came wandering back to her home over yonder, to escape the blows of her husband. And next morning she died in the home that her little bow-legged brother, working and saving, had bought for their widowed mother.

My journey was done, and behind me lay hill and dale, and Life and Death. How shall man measure Progress there where the dark-faced Josie lies? How many heartfuls of sorrow shall balance a bushel of wheat? How hard a thing is life to the lowly, and yet how human and real! And all this life and love and strife and failure,--is it the twilight of nightfall or the flush of some faint-dawning day?

Thus sadly musing, I rode to Nashville in the Jim Crow car.

THE CAPTURE OF A SLAVER by J. Taylor Wood

From 1830 to 1850 both Great Britain and the United States, by joint convention, kept on the coast of Africa at least eighty guns afloat for the suppression of the slave trade. Most of the vessels so employed were small corvettes, brigs, or schooners; steam at that time was just being introduced into the navies of the world.

Nearly fifty years ago I was midshipman on the United States brig Porpoise, of ten guns. Some of my readers may remember these little ten-gun coffins, as many of them proved to be to their crews. The Porpoise was a fair sample of the type; a full-rigged brig of one hundred and thirty tons, heavily sparred, deep waisted, and carrying a battery of eight twenty-four-pound carronades and two long chasers; so wet that even in a moderate breeze or sea it was necessary to batten down; and so tender that she required careful watching; only five feet between decks, her quarters were necessarily cramped and uncomfortable, and, as far as possible, we lived on deck. With a crew of eighty all told, Lieutenant Thompson was in command, Lieutenant Bukett executive officer, and two midshipmen were the line officers. She was so slow that we could hardly hope for a prize except by a fluke. Repeatedly we had chased suspicious craft only to be out-sailed.

At this time the traffic in slaves was very brisk; the demand in the Brazils, in Cuba, and in other Spanish West Indies was urgent, and the profit of the business so great that two or three successful ventures would enrich any one. The slavers were generally small, handy craft; fast, of course; usually schooner-rigged, and carrying flying topsails and forecourse. Many were built in England or elsewhere purposely for the business, without, of course, the knowledge of the builders, ostensibly as yachts or traders. The Spaniards and Portuguese were the principal offenders, with occasionally an English-speaking renegade.

The slave depots, or barracoons, were generally located some miles up a river. Here the slaver was secure from capture and could embark his live cargo at his leisure. Keeping a sharp lookout on the coast, the dealers were able to follow the movements of the cruisers, and by means of smoke, or in other ways, signal when the coast was clear for the coming down the river and sailing of the loaded craft. Before taking in the cargoes they were always fortified with all the necessary papers and documents to show they were engaged in legitimate commerce, so it was only when caught in flagrante delicto that we could hold them.

We had been cruising off the coast of Liberia doing nothing, when we were ordered to the Gulf of Guinea to watch the Bonny and Cameroons mouths of the great Niger River. Our consort was H.M. schooner Bright, a beautiful craft about our tonnage, but with

half our crew, and able to sail three miles to our two. She was an old slaver, captured and adapted as a cruiser. She had been very successful, making several important captures of full cargoes, and twice or thrice her commanding officer and others had been promoted. Working our way slowly down the coast in company with the Bright, we would occasionally send a boat on shore to reconnoitre or gather any information we could from the natives through our Krooman interpreter. A few glasses of rum or a string of beads would loosen the tongue of almost any one. At Little Bonny we heard that two vessels were some miles up the river, ready to sail, and were only waiting until the coast was clear. Captain James, of the Bright, thought that one, if not both, would sail from another outlet of the river, about thirty miles to the southward, and determined to watch it.

We both stood to that direction. Of course we were watched from the shore, and the slavers were kept posted as to our movements. They supposed we had both gone to the Cameroons, leaving Little Bonny open; but after dark, with a light land breeze, we wore round and stood to the northward, keeping offshore some distance, so that captains leaving the river might have sufficient offing to prevent their reaching port again or beaching their craft. At daybreak, as far as we could judge, we were about twenty miles offshore to the northward and westward of Little Bonny, in the track of any vessel bound for the West Indies. The night was dark with occasional rain squalls, when the heavens would open and the water come down in a flood. Anxiously we all watched for daylight, which comes under the equator with a suddenness very different from the prolonged twilight of higher latitudes. At the first glimmer in the east every eye was strained on the horizon, all eager, all anxious to be the first to sight anything within our vision. The darkness soon gave way to gray morn. Day was dawning, when suddenly a Krooman by my side seized my hand and, without saying a word, pointed inshore. I looked, but could see nothing. All eyes were focused in that direction, and in a few minutes the faint outline of a vessel appeared against the sky. She was some miles inshore of us, and as the day brightened we made her out to be a brigantine (an uncommon rig in those days), standing across our bows, with all studding sails set on the starboard side, indeed everything that could pull, including water sails and save-all. We were on the same tack heading to the northward. We set everything that would draw, and kept off two points, bringing the wind abeam so as to head her off.

The breeze was light and off the land. We had not yet been seen against the darker western horizon, but we knew it could only be a few minutes longer before their sharp eyes would make us out. Soon we saw the studding sails and all kites come down by the run and her yards braced up sharp on the same tack as ours. We also hauled by the wind. At sunrise she was four points on our weather bow, distant about four miles. We soon perceived that she could outsail our brig and if the wind held would escape. Gradually she drew away from us until she was hull down. Our only hope now was that the land breeze would cease and the sea breeze come in. As the sun rose we gladly noticed the wind lessening, until at eleven o'clock it was calm. Not a breath ruffled the surface of the sea; the sun's rays in the zenith were reflected as from a mirror; the waters seemed like molten lead.

I know of nothing more depressing than a calm in the tropics,--a raging sun overhead, around an endless expanse of dead sea, and a feeling of utter helplessness that is overpowering. What if this should last? what a fate! The Rime of the Ancient Mariner comes to our mind. Come storm and tempest, come hurricanes and blizzards, anything but an endless stagnation. For some hours we watched earnestly the horizon to the westward, looking for the first dark break on the smooth sea. Not a cloud was in the heavens. The brig appeared to be leaving us either by towing or by sweeps; only her topgallant sail was above the horizon. It looked as if the sea breeze would desert us. It usually came in about one o'clock, but that hour and another had passed and yet we watched for the first change. Without a breeze our chances of overhauling the stranger were gone. Only a white speck like the wing of a gull now marked her whereabouts on the edge of the horizon, and in another hour she would be invisible even from the masthead.

When we were about to despair, our head Krooman drew the captain's attention to the westward and said the breeze was coming. We saw no signs of it, but his quick eye had noticed light feathery clouds rising to the westward, a sure indication of the coming breeze. Soon we could see the glassy surface ruffled at different points as the breeze danced over it, coming on like an advancing line of skirmishers; and as we felt its first gentle movement on our parched faces, it was welcome indeed, putting new life into all of us. The crew needed no encouragement to spring to their work. As the little brig felt the breeze and gathered steerageway, she was headed for the chase, bringing the wind on her starboard quarter. In less than five minutes all the studding sails that would draw were set, as well as everything that would pull. The best quartermaster was sent to the wheel, with orders to keep the chase directly over the weather end of the spritsail yard. The captain ordered the sails wet, an expedient I never had much faith in, unless the sails are very old. But as if to recompense us for the delay, the breeze came in strong and steady. Our one hope now was to follow it up close, and to carry it within gunshot of the brig, for if she caught it before we were within range she would certainly escape. All hands were piped to quarters, and the long eighteen-pounder on the forecastle was loaded with a full service charge; on this piece we relied to cripple the chase. We were now rapidly raising her, and I was sent aloft on the fore topsail yard, with a good glass to watch her movements. Her hull was in sight and she was still becalmed, though her head was pointed in the right direction, and

everything was set to catch the coming breeze. She carried a boat on each side at the davits like a man-of-war, and I reported that I could make out men securing them. They had been towing her, and only stopped when they saw us drawing near.

Anxiously we watched the breeze on the water as it narrowed the sheen between us, and we were yet two miles or more distant when she first felt the breeze. As she did so we hoisted the English blue ensign,--for the fleet at this time was under a Rear Admiral of the Blue,--and fired a weather gun, but no response was made. Fortunately the wind continued to freshen and the Porpoise was doing wonderfully well. We were rapidly closing the distance between us. We fired another gun, but no attention was paid to it. I noticed from the movements of the crew of the brig that they were getting ready for some manoeuvre, and reported to the captain. He divined at once what the manoeuvre would be, and ordered the braces be led along, hands by the studding-sail halyards and tacks, and everything ready to haul by the wind. We felt certain now of the character of our friend, and the men were already calculating the amount of their prize money. We were now within range, and must clip her wings if possible.

The first lieutenant was ordered to open fire with the eighteen-pounder. Carefully the gun was laid, and as the order "fire" was given, down came our English flag, and the stop of the Stars and Stripes was broken at the gaff. The first shot touched the water abeam of the chase and ricochetted ahead of her. She showed the Spanish flag. The captain of the gun was ordered to elevate a little more and try again. The second shot let daylight through her fore topsail, but the third was wide again.

Then the sharp, quick order of the captain, "Fore topsail yard there, come down on deck, sir!" brought me down on the run. "Have both cutters cleared away and ready for lowering," were my orders as I reached the quarter-deck. Practice from the bow chasers continued, but the smoke that drifted ahead of us interfered with the accuracy of the firing, and no vital part was touched, though a number of shots went through her sails. The captain in the main rigging never took his eye from the Spaniard, evidently expecting that as a fox when hard pressed doubles on the hounds, the chase would attempt the same thing. And he was not disappointed, for when we had come within easy range of her, the smoke hid her from view for a few minutes, and as it dispersed the first glimpse showed the captain that her studding sails had all gone, and that she had hauled by the wind, standing across our weather bow. Her captain had lost no time in taking in his studding sails; halyards, tacks, and sheets had all been cut together and dropped overboard.

It was a bold and well-executed manoeuvre, and we could not help admiring the skill with which she was handled. However, we had been prepared for this move. "Ease down your helm." "Lower away. Haul down the studding sails." "Ease away the weather braces. Brace up." "Trim down the head sheets," were the orders which followed in rapid succession, and were as quickly executed. The Spaniard was now broad on our lee bow, distant not more than half a mile, but as she felt the wind which we brought down she fairly spun through the water, exposing her bright copper. She was both head-reaching and outsailing us; in half an hour she would have been right ahead of us, and in an hour the sun would be down. It was now or never. We could bring nothing to bear except the gun on the forecastle. Fortunately it continued smooth, and we were no longer troubled with smoke. Shot after shot went hissing through the air after her; a number tore through the sails or rigging, but not a spar was touched nor an important rope cut. We could see some of her crew aloft reeving and stopping braces and ready to repair any damage done, working as coolly under fire as old man-of-war's men. But while we were looking, down came the gaff of her mainsail, and the gaff-topsail fell all adrift; a lucky shot had cut her peak halyards. Our crew cheered with a will. "Well done, Hobson; try it again!" called the captain to the boatswain's mate, who was captain of the gun.

After the next shot, the topgallant yard swayed for a few minutes and fell forward. The order was given to cease firing; she was at our mercy. We were rapidly nearing the chase, when she backed her topsail. We kept off, and when within easy range of the carronades "hove to" to windward. Lieutenant Bukett was ordered to board her in the first cutter and take charge. I followed in the second cutter, with orders to bring the captain on board with his papers. A few strokes sent us alongside of a brig about our tonnage, but with a low rail and a flush deck. The crew, some eighteen or twenty fine-looking seamen, were forward eagerly discussing the situation of affairs. The captain was aft with his two officers, talking to Lieutenant Bukett. He was fair, with light hair curling all over his head, beard cut short, about forty years of age, well set up, with a frame like a Roman wrestler, evidently a tough customer in a rough-and-ready scrimmage.

He spoke fairly good English, and was violently denouncing the outrage done to his flag; his government would demand instant satisfaction for firing upon a legitimate trader on the high seas. I have the lieutenant Captain Thompson's orders, to bring the captain and his papers on board at once. His harangue was cut short by orders to get on board my boat. He swore with a terrible oath that he would never leave his vessel. "Come on board, men," said I, and twenty of our crew were on deck in a jiffy. I stationed my coxswain, Parker, at the cabin companion way with orders to allow no one to pass. "Now," said Lieutenant Bukett to the

Spaniard, "I will take you on board in irons unless you go quietly." He hesitated a moment, then said he would come as soon as he had gone below to bring up his papers. "No, never mind your papers; I will find them," said the lieutenant, for he saw the devil in the Spaniard's eyes, and knew he meant mischief. Our captive made one bound for the companion way, however, and seizing Parker by the throat hurled him into the water ways as if he had been a rag baby. But fortunately he slipped on a small grating and fell on his knees, and before he could recover himself two of our men threw themselves upon him.

I closed the companion way. The struggle was desperate for a few minutes, for the Spaniard seemed possessed of the furies, and his efforts were almost superhuman. Twice he threw the men from him across the deck, but they were reinforced by Parker, who, smarting under his discomfiture, rushed in, determined to down him. I was anxious to end it with my pistol, but Lieutenant Bukett would not consent. The Spaniard's officers and men made some demonstration to assist, but they were quickly disposed of: his two mates were put in irons and the crew driven forward. Struggling, fighting, every limb and every muscle at work, the captain was overpowered; a piece of the signal halyards brought his hands together, and handcuffs were slipped on his wrists. Only then he succumbed, and begged Lieutenant Bukett to blow out his brains, for he had been treated like a pirate.

Without doubt if he had reached the cabin he would have blown up the vessel, for in a locker over the transom were two open kegs of powder. I led him to my boat, assisted him in, and returned to the Porpoise. As soon as the Spaniard reached the deck the captain ordered his irons removed, and expressed his regret that it had been necessary to use force. The prisoner only bowed and said nothing. The captain asked him what his cargo consisted of. He replied, "About four hundred blacks bound to the Brazils."

I was then ordered to return to the brig, bring on board her crew, leaving only the cook and steward, and to take charge of the prize as Lieutenant Bukett, our first lieutenant, was not yet wholly recovered from an attack of African fever. The crew of twenty men, when brought on board, consisted of Spaniards, Greeks, Malays, Arabs, white and black, but had not one Anglo-Saxon. They were ironed in pairs and put under guard.

From the time we first got on board we had heard moans, cries, and rumblings coming from below, and as soon as the captain and crew were removed, the hatches had been taken off, when there arose a hot blast as from a charnel house, sickening and overpowering. In the hold were three or four hundred human beings, gasping, struggling for breath, dying; their bodies, limbs, faces, all expressing terrible suffering. In their agonizing fight for life, some had torn or wounded themselves or their neighbors dreadfully; some were stiffened in the most unnatural positions. As soon as I knew the condition of things I sent the boat back for the doctor and some whiskey. It returned bringing Captain Thompson, and for an hour or more we were all hard at work lifting and helping the poor creatures on deck, where they were laid out in rows. A little water and stimulant revived most of them; some, however, were dead or too far gone to be resuscitated. The doctor worked earnestly over each one, but seventeen were beyond human skill. As fast as he pronounced them dead they were quickly dropped overboard.

Night closed in with our decks covered so thickly with the ebony bodies that with difficulty we could move about; fortunately they were as quiet as so many snakes. In the meantime the first officer, Mr. Block, was sending up a new topgallant yard, reeving new rigging, repairing the sails, and getting everything ataunto aloft. The Kroomen were busy washing out and fumigating the hold, getting ready for our cargo again. It would have been a very anxious night, except that I felt relieved by the presence of the brig which kept within hail. Soon after daybreak Captain Thompson came on board again, and we made a count of the captives as they were sent below; 188 men and boys, and 166 women and girls. Seeing everything snug and in order the captain returned to the brig, giving me final orders to proceed with all possible dispatch to Monrovia, Liberia, land the negroes, then sail for Porto Praya, Cape de Verde Islands, and report to the commodore. As the brig hauled to the wind and stood to the southward and eastward I dipped my colors, when her crew jumped into the rigging and gave us three cheers, which we returned.

As she drew away from us I began to realize my position and responsibility: a young midshipman, yet in my teens, commanding a prize, with three hundred and fifty prisoners on board, two or three weeks' sail from port, with only a small crew. From the first I kept all hands aft except two men on the lookout, and the weather was so warm that we could all sleep on deck. I also ordered the men never to lay aside their pistols or cutlasses, except when working aloft, but my chief reliance was in my knowledge of the negro,--of his patient, docile disposition. Born and bred a slave he never thought of any other condition, and he accepted the situation without a murmur. I had never heard of blacks rising or attempting to gain their freedom on board a slaver.

My charges were all of a deep black; from fifteen to twenty-five years of age, and, with a few exceptions, nude, unless copper or brass rings on their ankles or necklaces of cowries can be described as articles of dress. All were slashed, or had the scars of branding on their foreheads and cheeks; these marks were the distinguishing features of different tribes or families. The men's hair

had been cut short, and their heads looked in some cases as if they had been shaven. The women, on the contrary, wore their hair "a la pompadour;" the coarse kinky locks were sometimes a foot or more above their heads, and trained square or round like a boxwood bush. Their features were of the pronounced African type, but, notwithstanding this disfigurement, were not unpleasing in appearance. The figures of all were very good, straight, well developed, some of the young men having bodies that would have graced a Mercury or an Apollo. Their hands were small, showing no evidences of work, only the cruel marks of shackles. These in some cases had worn deep furrows on their wrists or ankles.

They were obedient to all orders as far as they understood them, and would, I believe, have jumped overboard if told to do so. I forbade the men to treat them harshly or cruelly. I had the sick separated from the others, and allowed them to remain on deck all the time, and in this way I partly gained their confidence. I was anxious to learn their story. Fortunately one of the Kroomen found among the prisoners a native of a tribe living near the coast, and with him as interpreter was able to make himself understood. After a good deal of questioning I learned that most of them were from a long distance in the interior, some having been one and some two moons on the way, traveling partly by land and partly by river until they reached the coast. They had been sold by their kings or by their parents to the Arab trader for firearms or for rum. Once at the depots near the coast, they were sold by the Arabs or other traders to the slave captains for from twenty-five to fifty dollars a head. In the Brazils or West Indies they were worth from two to five hundred dollars. This wide margin, of course, attracted unscrupulous and greedy adventurers, who if they succeeded in running a few cargoes would enrich themselves.

Our daily routine was simple. At six in the morning the rope netting over the main hatch which admitted light and air was taken off, and twenty-five of each sex were brought up, and seated in two circles, one on each side of the deck. A large pan of boiled paddy was then placed in the centre by the cook and all went to work with their hands. A few minutes sufficed to dispose of every grain; then one of the Kroomen gave each of them a cup of water from a bucket. For half an hour after the meal they had the liberty of the deck, except the poop, for exercise, to wash and to sun themselves; for sunshine to a negro is meat and drink. At the end of this time they were sent below and another fifty brought up, and so on until all had been fed and watered. Paddy or rice was the staple article of food. At dinner boiled yams were given with the rice. Our passengers were quartered on a flying deck extending from the foremast to a point twenty feet abaft the main hatch from which came light and air. The height was about five feet; the men had one side and the women the other. Of course there was no furnishing of any kind, but all lay prone upon the bare deck in rows.

Every morning after breakfast the Kroomen would rig the force pump, screw on the hose and drench them all, washing out thoroughly between decks. They appeared to enjoy this, and it was cooling, for be it remembered we were close under the equator, the thermometer dancing about 90 deg. As the water was sluiced over them they would rub and scrub each other. Only the girls would try not to get their hair wet, for they were at all times particular about their headdress. It may be that this was the only part of their toilet that gave them any concern.

The winds were baffling and light, so we made but slow progress. Fortunately frequent rains, with sometimes a genuine tropical downpour or cloud-burst, gave us an opportunity of replenishing our water casks, and by spreading the awnings we were able to get a good supply. I found on inspection that there were at least thirty days' provisions on board, so on this score and that of water I felt easy. I lived on deck, seldom using the cabin, which was a veritable arsenal, with racks of muskets and cutlasses on two sides, many more than the captain needed to arm his crew, evidently intended for barter. Two or three prints of his favorite saints, ornamented with sharks' teeth, hung on one bulkhead. A well-thrummed mandolin and a number of French novels proved him to be a musical and literary fellow, who could probably play a bolero while making a troublesome slave walk a plank. I found also some choice vintages from the Douro and Bordeaux snugly stowed in his spirit locker, which proved good medicines for some of our captives, who required stimulants. Several of the girls were much reduced, refused nearly all food, and were only kept alive by a little wine and water. Two finally died of mere inanition. Their death did not in the least affect their fellows, who appeared perfectly indifferent and callous to all their surroundings, showing not the least sympathy or desire to help or wait on one another.

The fifth day after parting from the brig we encountered a tropical storm. The sun rose red and angry, and owing to the great refraction appeared three times its natural size. It climbed lazily to the zenith, and at noon we were shadowless. The sky was as calm as a vault, and the surface of the water was like burnished steel. The heat became so stifling that even the Africans were gasping for breath, and we envied them their freedom from all impediments. The least exertion was irksome, and attended with extreme lassitude. During the afternoon thin cirri clouds, flying very high, spread out over the western heavens like a fan. As the day lengthened they thickened to resemble the scales of a fish, bringing to mind the old saying, "A mackerel sky and a mare's tail," etc. The signs were all unmistakable, and even the gulls recognized a change, and, screaming, sought shelter on our spars. Mr. Block was ordered to send down all the light yards and sails; to take in and furl everything, using storm gaskets, except on the fore

and main storm staysails; to lash everything on deck; to batten down the hatches, except one square of the main; see all the shifting boards in place, so that our living cargo would not be thrown to leeward higgledy-piggledy, and to take four or five of the worst cases of the sick into the cabin and lay them on the floor.

The sun disappeared behind a mountainous mass of leaden-colored clouds which rose rapidly in the southern and western quarters. To the eastward, also, the signs were threatening. Night came on suddenly as it does in the tropics. Soon the darkness enveloped us, a palpable veil. A noise like the march of a mighty host was heard, which proved to be the approach of a tropical flood, heralded by drops as large as marbles. It churned the still waters into a phosphorescent foam which rendered the darkness only more oppressive. The rain came down as it can come only in the Bight of Benin. The avalanche cooled us, reducing the temperature ten or fifteen degrees, giving us new life, and relieving our fevered blood. I told Mr. Block to throw back the tarpaulin over the main hatch and let our dusky friends get some benefit of it. In half an hour the rain ceased, but it was as calm and ominous as ever.

I knew this was but the forerunner of something worse to follow, and we had not long to wait, for suddenly a blinding flash of lightning darted through the gloom from east to west, followed by one in the opposite direction. Without intermission, one blaze after another and thunder crashing until our eyes were blinded and our ears deafened, a thousand times ten thousand pieces of artillery thundered away. We seemed utterly helpless and insignificant. "How wonderful are Thy works," came to my mind. Still no wind; the brig lay helpless.

Suddenly, as a slap in the face, the wind struck us,--on the starboard quarter, fortunately. "Hard-a-starboard." "Hanl aft port fore staysail sheet," I called. But before she could gather way she was thrown down by the wind like a reed. She was "coming to" instead of "going off," and I tried to get the main storm staysail down but could not make myself heard. She was lying on her broadside. Luckily the water was smooth as yet. The main staysail shot out of the boltropes with a report like a twelve-pounder, and this eased her so that if the fore staysail would only hold she would go off. For a few minutes all we could do was to hold on, our lee rail in the water; but the plucky little brig rallied a little, her head went off inch by inch, and as she gathered way she righted, and catching the wind on our quarter we were off like a shot out of a gun. I knew we were too near the vortex of the disturbance for the wind to hang long in one quarter, so watched anxiously for a change. The sea rose rapidly while we were running to the northward on her course, and after a lull of a few minutes the wind opened from the eastward, butt end foremost, a change of eight points. Nothing was to be done but heave to, and this in a cross sea where pitch, weather roll, lee lurch, followed one another in such earnest that it was a wonder her masts were not switched out of her.

I passed an anxious night, most concerned about the poor creatures under hatches, whose sufferings must have been terrible. To prevent their suffocating I kept two men at the main hatch with orders to lift one corner of the tarpaulin whenever possible, even if some water did go below. Toward morning the wind and the sea went down rapidly, and as the sun rose it chased the clouds off, giving us the promise of a fine day. When the cook brought me a cup of coffee, I do not know that I ever enjoyed anything more. Hatches off, I jumped down into the hold to look after my prisoners. Battered and bruised they lay around in heaps. Only the shifting boards had kept them from being beaten into an indistinguishable mass. As fast as possible they were sent on deck, and the sun's rays, with a few buckets of water that were thrown over them, accomplished wonders in bringing them to life and starting them to care for their sore limbs and bruises.

One boy, when I motioned for him to go on deck, pointed quietly to his leg, and upon examination I found a fracture just above the knee. Swelling had already commenced. I had seen limbs set, and had some rough idea how it should be done. So while getting some splints of keg staves and bandages ready, I kept a stream of water pouring on the fracture, and then ordered two men to pull the limb in place, and it took all their strength. That done I put on the splints and wrapped the bandages tightly. Three weeks later I landed him in a fair way of recovery.

Gradually I allowed a larger number of the blacks to remain on deck, a privilege which they greatly enjoyed. To lie basking in the sun like saurians, half sleeping, half waking, appeared to satisfy all their wishes. They were perfectly docile and obedient, and not by word, gesture, or look did they express any dissatisfaction with orders given them. But again for any little acts of kindness they expressed no kind of appreciation or gratitude. Physically they were men and women, but otherwise as far removed from the Anglo-Saxon as the oyster from the baboon, or the mole from the horse.

On the fourteenth day from parting with the brig we made the palms on Cape Mesurado, the entrance to Monrovia Harbor. A light sea breath wafted us to the anchorage, a mile from the town, and when the anchor dropped from the bows and the chain ran

through the hawse pipe, it was sweet music to my ears; for the strain had been great, and I felt years older than when I parted from my messmates. A great responsibility seemed lifted from my shoulders, and I enjoyed a long and refreshing sleep for the first time in a fortnight. At nine the next morning I went on shore and reported to the authorities, the officials of Liberia, of which Monrovia is the capital.

This part of the African coast had been selected by the United States government as the home of emancipated slaves; for prior to the abolition excitement which culminated in the war, numbers of slaves in the South had been manumitted by their masters with the understanding that they should be deported to Liberia, and the Colonization Society, an influential body, comprising some of the leading men, like Madison, Webster, and Clay, had assisted in the same work. The passages of the negroes were paid; each family was given a tract of land and sufficient means to build a house. Several thousand had been sent out, most of whom had settled at Monrovia, and a few at other places on the coast. They had made no impression on the natives. On the contrary, many of them had intermarried with the natives, and the off-spring of these unions had lost the use of the English tongue, and had even gone back to the life and customs of their ancestors, sans clothing, sans habitations, and worship of a fetich.

Of course there were some notable exceptions, especially President Roberts, who proved himself a safe and prudent ruler, taking into consideration his surroundings and the material with which he had to work. The form of government was modeled after that of the United States, but it was top-heavy. Honorables, colonels, and judges were thicker than in Georgia. Only privates were scarce; for nothing delights a negro more than a little show or a gaudy uniform. On landing I was met by a dark mulatto, dressed in a straw hat, blue tail coat, silver epaulettes, linen trousers, with bare feet, and a heavy cavalry sabre hanging by his side. With him were three or four others in the same rig, except the epaulettes. He introduced himself as Colonel Harrison, chief of police. I asked to be directed to the custom house.

The collector proved to be an old negro from Raleigh, N. C., gray as a badger, spectacled, with manners of Lord Grandison and language of Mrs. Malaprop. I reported my arrival, and asked permission to land my cargo as soon as possible. He replied that in a matter of so much importance, devolving questions of momentous interest, it would be obligatory on him to consult the Secretary of the Treasury. I said I trusted he would so facilitate affairs that I might at an early hour disembarrass myself of my involuntary prisoners. I returned on board, and the day passed without any answer. The next morning I determined to go at once to headquarters and find out the cause of the delay by calling on the President.

He received me without any formality. I made my case as strong as possible, and pressed for an immediate answer. In reply he assured me he would consult with other members of his cabinet, and give me a final answer the next morning. That evening I dined with him en famille, and recognized some old Virginia dishes on the table. The next morning I waited impatiently for his decision, having made up my mind however, if it was unfavorable, to land my poor captives, be the consequences what they might.

About eleven o'clock a boat came off with an officer in full uniform, who introduced himself as Colonel Royal, bearer of dispatches from his Excellency the President. He handed me a letter couched in diplomatic language, as long as some of his brother presidents' messages on this side of the Atlantic. I had hardly patience to read it. The gist of it was, I might not land the captives at Monrovia, but might land them at Grand Bassa, about a hundred and fifty miles to the eastward; that Colonel Royal would accompany me with orders to the governor there to receive them. This was something I had not anticipated, and outside of my instructions. However, I thought it best to comply with the wishes of the government of our only colony.

Getting under way we stood to the southward and eastward, taking advantage of the light land and sea breeze, keeping the coast close aboard. The colonel had come on board without any impediments, and I wondered if he intended to make the voyage in his cocked hat, epaulettes, sword, etc. But soon after we had started he disappeared and emerged from the cabin bareheaded, barefooted, and without clothing except a blue dungaree shirt and trousers. Like a provident negro, having stowed away all his trappings, he appeared as a roustabout on a Western steamer. But he had not laid aside with his toggery any of his important and consequential airs. He ran foul of Mr. Block, who called him Mr. Cuffy, and ordered him to give him a pull with the main sheet. The colonel complained to me that he was not addressed by his name or title, and that he was not treated as a representative of his government should be. I reprimanded Mr. Block, and told him to give the visitor all his title. "All right, sir, but the colonel must keep off the weather side of the deck," growled the officer. The cook, the crew, and even the Kroomen, all took their cue from the first officer, and the colonel's lot was made most unhappy.

On the third day we reached Grand Bassa, and anchored off the beach about two miles, along which the surf was breaking so high that any attempt to land would be hazardous. Toward evening it moderated, and a canoe with three naked natives came off. One I

found could speak a little English. I told him to say to the governor that I would come on shore in the morning and see him, and land my cargo at the same time.

The next morning at sunrise we were boarded by a party of natives headed by one wearing a black hat half covered with a tarnished silver band, an old navy frock coat, much too small, between the buttons of which his well-oiled skin showed clearly. A pair of blue flannel trousers completed his outfit. An interpreter introduced him as King George of Grand Bassa. With him were about a dozen followers, each one wearing a different sort of garment--and seldom more than a single one--representing old uniforms of many countries. Two coats I noticed were buttoned up the back.

The king began by saying that he was and always had been a friend of the Americans; that he was a big man, had plenty of men and five wives, etc. While he was speaking, a white-bearded old colored gentleman came over the gangway, dressed in a linen roundabout and trousers, with a wide-brimmed straw hat. At the same time Colonel Royal came up from the cabin in grande tenue and introduced us to the Hon. Mr. Marshall, governor of Bassa, formerly of Kentucky.

In a few minutes he explained the situation. With a few settlers he was located at this place, on the frontier of the colony, and they were there on sufferance only from the natives. I told him Colonel Royal would explain my mission to him and the king. The colonel, bowing low to the king, the governor, and myself, and bringing his sword down with a thud on the deck, drew from between the bursting buttons of his coat the formidable document I had seen at Monrovia, and with most impressive voice and gesture commenced to read it. The king listened for a few minutes, and then interrupted him. I asked the interpreter what he said. He replied, "King say he fool nigger; if he comes on shore he give him to Voodoo women." Then turning his back he walked forward. The colonel dropped his paper, and drawing his sword, in the most dramatic manner claimed protection in the name of the government, declaring that he had been insulted. I told him to keep cool, since he was certainly safe as long as he was on board my ship. He grumbled and muttered terrible things, but subsided gradually like the departing thunder of a summer storm.

I arranged the landing of the passengers with Governor Marshall, whom I found a sensible, clear-headed old man, ready to cooperate in every way. But he suggested that I had better consult the king before doing anything. I did so, and he at once said they could not land. I told the interpreter to say they would be landed at once and put under the protection of the governor; that if the king or his people hurt them or ran them off I would report it to our commodore, who would certainly punish him severely. Finding me determined, he began to temporize, and asked that the landing be put off until the next day, that he might consult with his head people, for if I sent them on shore before he had done so they would kill them. "If that is the case," I replied, "I will hold you on board as a hostage for their good behavior." This threat surprised him, and he changed his tactics. After a little powwow with some of his followers, he said that if I would give him fifty muskets, twenty pounds of powder, the colonel's sword, and some red cloth for his wives, I might land them. I replied that I had not a musket to spare nor an ounce of powder, that the colonel was a high officer of his government, and that he of course would not give up his uniform. Fortunately the colonel had retired to the cabin and did not hear this modest demand, or he would have been as much outraged as if his sable Majesty had asked for him to be served "roti a l'Ashantee." However, I told the king I would send his wives some cloth and buttons. He grunted his approval but returned again to the charge, and asked that he might choose a few of the captives for his own use, before landing. "Certainly not," I answered, "neither on board nor on shore," and added that he would be held accountable for their good treatment as free men and women. He left thoroughly disappointed and bent on mischief.

In the meantime Mr. Block had made all preparations for landing, and had the boats lowered and ranged alongside, with sufficient rice to last the blacks a week or ten days. The men and boys were sent first. When they were called up from the hold and ordered into the boats not one of them moved. They evidently divined what had been going on and dreaded leaving the vessel, though our Kroomen tried to explain that they would be safe and free on shore. The explanation was without effect, however, and they refused to move. The could only understand that they were changing masters, and they preferred the present ones. Sending three or four men down, I told them to pass up the negroes one at a time. Only a passive resistance was offered, such as one often sees exhibited by cattle being loaded on the cars or on a steamer, and were silent, not uttering a word of complaint. By noon the men were all on shore, and then we began with the girls. They were more demonstrative than the men, and by their looks and gestures begged not to be taken out of the vessel. I was much moved, for it was a painful duty, and I had become interested in these beings, so utterly helpless, so childlike in their dependence on those around them. And I could not help thinking what their fate would be, thrown upon the shore hundreds of miles from their homes, and among a people strange to them in language.

Even Mr. Block was deeply stirred. "He had not shipped," he said, "for such work." I went to my cabin and left him in charge. In the course of an hour he reported, "All ashore, sir." I told him to have the gig manned and I would go on shore with Colonel Royal, and

get a receipt from Governor Marshall for my late cargo. The colonel declined to accompany me, alleging sickness and requesting me to get the necessary papers signed. No doubt he felt safer on board than within reach of King George.

We landed through the surf on a sandy beach, on which the waves of the Atlantic were fretting. Near by was a thick grove of cocoanut trees, under which in groups of four and five were those who had just been landed. They were seated on the ground, their heads resting on their knees, in a position of utter abnegation, surrounded by three or four hundred chattering savages of all ages, headed by the king. With the exception of him and a few of his head men, the clothing of the company would not have covered a rag baby. They were no doubt discussing the appearance of the strangers and making their selections.

I found the governor's house and the houses of the few settlers some distance back on a slight elevation. The governor was comfortably, though plainly situated, with a large family around him. He gave me a receipt for the number of blacks landed, but said it would be impossible for him to prevent the natives from taking and enslaving them. I agreed with him, and said he must repeat to the king what I had told him. Then bidding him good-by I returned on board, sad and weary as one often feels after being relieved of a great burden. At the same time I wondered whether the fate of these people would have been any worse if the captain of the slaver had succeeded in landing them in the Brazils or the West Indies. Sierra Leone being a crown colony, the English could land all their captives there and provide for them until they were able to work for themselves. In this respect they had a great advantage over us.

Getting under way, I proceeded to Monrovia to land Colonel Royal, and then to Porto Praya, our squadron's headquarters. There I found Commodore Gregory in the flagship corvette Portsmouth, and reported to him. Soon after the Porpoise came in, and I joined my old craft, giving up my command of the captured slaver rather reluctantly.

MR. CHARLES W. CHESNUTT'S STORIES by W. D. Howells

The critical reader of the story called The Wife of his Youth, which appeared in these pages two years ago, must have noticed uncommon traits in what was altogether a remarkable piece of work. The first was the novelty of the material; for the writer dealt not only with people who were not white, but with people who were not black enough to contrast grotesquely with white people,--who in fact were of that near approach to the ordinary American in race and color which leaves, at the last degree, every one but the connoisseur in doubt whether they are Anglo-Saxon or Anglo-African. Quite as striking as this novelty of the material was the author's thorough mastery of it, and his unerring knowledge of the life he had chosen in its peculiar racial characteristics. But above all, the story was notable for the passionless handling of a phase of our common life which is tense with potential tragedy; for the attitude, almost ironical, in which the artist observes the play of contesting emotions in the drama under his eyes; and for his apparently reluctant, apparently helpless consent to let the spectator know his real feeling in the matter. Any one accustomed to study methods in fiction, to distinguish between good and bad art, to feel the joy which the delicate skill possible only from a love of truth can give, must have known a high pleasure in the quiet self-restraint of the performance; and such a reader would probably have decided that the social situation in the piece was studied wholly from the outside, by an observer with special opportunities for knowing it, who was, as it were, surprised into final sympathy.

Now, however, it is known that the author of this story is of negro blood,--diluted, indeed, in such measure that if he did not admit this descent few would imagine it, but still quite of that middle world which lies next, though wholly outside, our own. Since his first story appeared he has contributed several others to these pages, and he now makes a showing palpable to criticism in a volume called The Wife of his Youth, and Other Stories of the Color Line; a volume of Southern sketches called The Conjure Woman; and a short life of Frederick Douglass, in the Beacon Series of biographies. The last is a simple, solid, straight piece of work, not remarkable above many other biographical studies by people entirely white, and yet important as the work of a man not entirely white treating of a great man of his inalienable race. But the volumes of fiction ARE remarkable above many, above most short stories by people entirely white, and would be worthy of unusual notice if they were not the work of a man not entirely white.

It is not from their racial interest that we could first wish to speak of them, though that must have a very great and very just claim upon the critic. It is much more simply and directly, as works of art, that they make their appeal, and we must allow the force of this quite independently of the other interest. Yet it cannot always be allowed. There are times in each of the stories of the first volume when the simplicity lapses, and the effect is as of a weak and uninstructed touch. There are other times when the attitude, severely impartial and studiously aloof, accuses itself of a little pompousness. There are still other times when the literature is a little too ornate for beauty, and the diction is journalistic, reporteristic. But it is right to add that these are the exceptional times, and that for far the greatest part Mr. Chesnutt seems to know quite as well what he wants to do in a given case as Maupassant, or Tourguenief,

or Mr. James, or Miss Jewett, or Miss Wilkins, in other given cases, and has done it with an art of kindred quiet and force. He belongs, in other words, to the good school, the only school, all aberrations from nature being so much truancy and anarchy. He sees his people very clearly, very justly, and he shows them as he sees them, leaving the reader to divine the depth of his feeling for them. He touches all the stops, and with equal delicacy in stories of real tragedy and comedy and pathos, so that it would be hard to say which is the finest in such admirably rendered effects as The Web of Circumstance, The Bouquet, and Uncle Wellington's Wives. In some others the comedy degenerates into satire, with a look in the reader's direction which the author's friend must deplore.

As these stories are of our own time and country, and as there is not a swashbuckler of the seventeenth century, or a sentimentalist of this, or a princess of an imaginary kingdom, in any of them, they will possibly not reach half a million readers in six months, but in twelve months possibly more readers will remember them than if they had reached the half million. They are new and fresh and strong, as life always is, and fable never is; and the stories of The Conjure Woman have a wild, indigenous poetry, the creation of sincere and original imagination, which is imparted with a tender humorousness and a very artistic reticence. As far as his race is concerned, or his sixteenth part of a race, it does not greatly matter whether Mr. Chesnutt invented their motives, or found them, as he feigns, among his distant cousins of the Southern cabins. In either case, the wonder of their beauty is the same; and whatever is primitive and sylvan or campestral in the reader's heart is touched by the spells thrown on the simple black lives in these enchanting tales. Character, the most precious thing in fiction, is as faithfully portrayed against the poetic background as in the setting of the Stories of the Color Line.

Yet these stories, after all, are Mr. Chesnutt's most important work, whether we consider them merely as realistic fiction, apart from their author, or as studies of that middle world of which he is naturally and voluntarily a citizen. We had known the nethermost world of the grotesque and comical negro and the terrible and tragic negro through the white observer on the outside, and black character in its lyrical moods we had known from such an inside witness as Mr. Paul Dunbar; but it had remained for Mr. Chesnutt to acquaint us with those regions where the paler shades dwell as hopelessly, with relation to ourselves, as the blackest negro. He has not shown the dwellers there as very different from ourselves. They have within their own circles the same social ambitions and prejudices; they intrigue and truckle and crawl, and are snobs, like ourselves, both of the snobs that snub and the snobs that are snubbed. We may choose to think them droll in their parody of pure white society, but perhaps it would be wiser to recognize that they are like us because they are of our blood by more than a half, or three quarters, or nine tenths. It is not, in such cases, their negro blood that characterizes them; but it is their negro blood that excludes them, and that will imaginably fortify them and exalt them. Bound in that sad solidarity from which there is no hope of entrance into polite white society for them, they may create a civilization of their own, which need not lack the highest quality. They need not be ashamed of the race from which they have sprung, and whose exile they share; for in many of the arts it has already shown, during a single generation of freedom, gifts which slavery apparently only obscured. With Mr. Booker Washington the first American orator of our time, fresh upon the time of Frederick Douglass; with Mr. Dunbar among the truest of our poets; with Mr. Tanner, a black American, among the only three Americans from whom the French government ever bought a picture, Mr. Chesnutt may well be willing to own his color.

But that is his personal affair. Our own more universal interest in him arises from the more than promise he has given in a department of literature where Americans hold the foremost place. In this there is, happily, no color line; and if he has it in him to go forward on the way which he has traced for himself, to be true to life as he has known it, to deny himself the glories of the cheap success which awaits the charlatan in fiction, one of the places at the top is open to him. He has sounded a fresh note, boldly, not blatantly, and he has won the ear of the more intelligent public.

PATHS OF HOPE FOR THE NEGRO by Jerome Dowd

PRACTICAL SUGGESTIONS OF A SOUTHERNER

It is too late in the day to discuss whether it would have been better had the Negro never been brought into the Southern States. If his presence here has been beneficial, or is ever to prove so, the price of the benefit has already been dearly paid for. He was the occasion of the deadliest and most expensive war in modern times. In the next place, his presence has corrupted politics and has limited statesmanship to a mere question of race supremacy. Great problems concerning the political, industrial, and moral life of the people have been subordinated or overshadowed, so that, while important strides have been made elsewhere in the investigation of social conditions and in the administration of State and municipal affairs, in civil-service reform, in the management of penal and charitable institutions, and in the field of education, the South has lagged behind.

On the charts of illiteracy and crime the South is represented by an immense black spot. Such are a few items of the account. It will require millions more of dollars and generations more of earnest work before the total cost is met of bringing the black man to this side of the globe. But the debt has been incurred and must be liquidated.

The welfare of the Negro is bound up with that of the white man in many important particulars:

First, the low standard of living among the blacks keeps down the wages of all classes of whites. So long as the Negroes are content to live in miserable huts, wear rags, and subsist upon hog fat and cow-pease, so long must the wages of white people in the same kind of work be pressed toward the same level. The higher we raise the standard of living among the Negroes, the higher will be the wages of the white people in the same occupations. The low standard of the Negroes is the result of low productive power. The less intelligent and skilled the Negroes are, the less they can produce, whether working for themselves or others, and hence, the less will be the total wealth of the country.

But it may be asked, When the standard of living of the Negroes is raised, will not wages go up, and will not that be a drawback? Certainly wages will go up, because the income of all classes will be increased. High wages generally indicate high productive power and general wealth, while low wages indicate the opposite. Only benefits can arise from better wages.

In the next place, the Negro's propensity to crime tends to excite the criminal tendencies of the white man. The South enjoys the distinction of having the highest percentage of crime in all the civilized world, and the reason is that the crimes of the one race provoke counter-crimes in the other.

The physical well-being of the one race has such a conspicuous influence upon that of the other that the subject requires no elaboration. The uncleanliness of person and habits of the Negroes in their homes and in the homes of their employers tends to propagate diseases, and thus impairs the health and increases the death-rate of the whole population.

Again, the lack of refinement in intellect, manners, and dress among the Negroes is an obstacle to the cultivated life of the whites. Ignorance and the absence of taste and self-respect in servants result in badly kept homes and yards, destruction of furniture and ware, ill-prepared food, poor table service, and a general lowering of the standard of living. Furthermore, the corrupt, coarse, and vulgar language of the Negroes is largely responsible for the jumbled and distorted English spoken by many of the Southern whites.

Seeing that the degradation of the Negro is an impediment to the progress and civilization of the white man, how may we effect an improvement in his condition?

First, municipalities should give more attention to the streets and alleys that traverse Negro settlements. In almost every town in the South there are settlements, known by such names as "New Africa," "Haiti," "Log Town," "Smoky Hollow," or "Snow Hill," exclusively inhabited by Negroes. These settlements are often outside the corporate limits. The houses are built along narrow, crooked, and dirty lanes, and the community is without sanitary regulations or oversight. These quarters should be brought under municipal control, the lanes widened into streets and cleaned, and provision made to guard against the opening of similar ones in the future.

In the next place, property-owners should build better houses for the Negroes to live in. The weakness in the civilization of the Negroes is most pronounced in their family life. But improvement in this respect is not possible without an improvement in the character and the comforts of the houses they live in. Bad houses breed bad people and bad neighborhoods. There is no more distinctive form of crime than the building and renting of houses unfit for human habitation.

Scarcely second in importance to improvements in house architecture is the need among Negroes of more time to spend with their families. Employers of Negro labor should be less exacting in the number of hours required for a day's work. Many domestic servants now work from six in the morning until nine and ten o'clock at night. The Southern habit of keeping open shopping-places until late at night encourages late suppers, retains cooks, butlers, and nurses until bedtime, and robs them of all home life. If the merchants would close their shops at six o'clock, as is the custom in the North, the welfare of both races would be greatly promoted.

Again, a revolution is needed in the character of the Negro's religion. At present it is too largely an affair of the emotions. He needs to be taught that the religious life is something to grow into by the perfection of personality, and not to be jumped into or sweated into at camp-meetings. The theological seminaries and the graduate preachers should assume the task of grafting upon the religion of the Negro that much sanity at least.

A reform is as much needed in the methods and aims of Negro education. Up to the present Negro education has shared with that of the white man the fault of being top-heavy. Colleges and universities have developed out of proportion to, and at the expense of, common schools. Then, the kind of education afforded the Negro has not been fitted to his capacities and needs. He has been made to pursue courses of study parallel to those prescribed for the whites, as though the individuals of both races had to fill the same positions in life. Much of the Negro's education has had nothing to do with his real life-work. It has only made him discontented and disinclined to unfold his arms. The survival of the Negroes in the race for existence depends upon their retaining possession of the few bread-winning occupations now open to them. But instead of better qualifying themselves for these occupations they have been poring over dead languages and working problems in mathematics. In the meantime the Chinaman and the steam-laundry have abolished the Negro's wash-tub, trained white "tonsorial artists" have taken away his barber's chair, and skilled painters and plasterers and mechanics have taken away his paint-brushes and tool-chests. Every year the number of occupations open to him becomes fewer because of his lack of progress in them. Unless a radical change takes place in the scope of his education, so that he may learn better how to do his work, a tide of white immigration will set in and force him out of his last stronghold, domestic service, and limit his sphere to the farm.

All primary schools for the Negroes should be equipped for industrial training in such work as sewing, cooking, laundering, carpentry, and house-cleaning, and, in rural districts, in elementary agriculture.

Secondary schools should add to the literary courses a more advanced course in industrial training, so as to approach as nearly as possible the objects and methods of the Tuskegee and Hampton Industrial and Normal Schools. Too much cannot be said in behalf of the revolution in the life of the Negro which the work of these schools promises and, in part, has already wrought. The writer is fully aware that education has a value aside from and above its bread-winning results, and he would not dissuade the Negro from seeking the highest culture that he may be capable of; but it is folly for him to wing his way through the higher realms of the intellect without some acquaintance with the requirements and duties of life.

Changes are needed in the methods of Negro education as well as in its scope. Educators should take into account, more than they have yet done, the differences in the mental characteristics of the two races. It is a well-established fact that, while the lower races possess marked capacity to deal with simple, concrete ideas, they lack power of generalization, and soon fatigue in the realm of the abstract. It is also well known that the inferior races, being deficient in generalization, which is a subjective process, are absorbed almost entirely in the things that are objective. They have strong and alert eyesight, and are susceptible to impressions through the medium of the eye to an extent that is impossible to any of the white races. This fact is evidenced in the great number of pictures found in the homes of the Negroes. In default of anything better, they will paper their walls with advertisements of the theater and the circus, and even with pictures from vicious newspapers. They delight in street pageantry, fancy costumes, theatrical performances, and similar spectacles. Factories employing Negroes generally find it necessary to suspend operations on "circus day." They love stories of adventure and any fiction that gives play to their imaginations. All their tastes lie in the realm of the objective and the concrete.

Hence, in the school-room stress should be laid on those studies that appeal to the eye and the imagination. Lessons should be given in sketching, painting, drawing, and casting. Reprints of the popular works of art should be placed before the Negroes, that their love for art may be gratified and their taste cultivated at the same time. Fancy needlework, dress-making, and home decorations should also have an important place. These studies, while not contributing directly to bread-winning, have a refining and softening influence upon character, and inspire efforts to make the home more attractive. The more interest we can make the Negro take in his personal appearance and in the comforts of his home, the more we shall strengthen and promote his family life and raise the level of his civilization.

The literary education of the Negro should consist of carefully selected poems and novels that appeal to his imagination and produce clear images upon his mind, excluding such literature as is in the nature of psychological or moral research. Recitations and dialogues should be more generally and more frequently required. In history emphasis should be given to what is picturesque, dramatic, and biographical.

Coming to the political phase of the Negro problem, there is a general agreement among white men that the Southern States cannot keep pace with the progress of the world as long as they are menaced by Negro domination, and that, therefore, it is necessary to eliminate the Negro vote from politics. When the Negroes become intelligent factors in society, when they become thrifty and accumulate wealth, they will find the way to larger exercise of citizenship. They can never sit upon juries to pass upon life and property until they are property-owners themselves, and they can never hold the reins of government by reason of mere

superiority of numbers. Before they can take on larger political responsibilities they must demonstrate their ability to meet them.

The Negroes will never be allowed to control State governments so long as they vote at every election upon the basis of color, without regard whatever to political issues or private convictions. If the Negroes would divide their votes according to their individual opinions, as the lamented Charles Price, one of their best leaders, advised, there would be no danger of Negro domination and no objection to their holding offices which they might be competent to fill. But as there is no present prospect of their voting upon any other basis than that of color, the white people are forced to accept the situation and protect themselves accordingly. Years of bitter and costly experience have demonstrated over and over again that Negro rule is not only incompetent and corrupt, but a menace to civilization. Some people imagine that there is something anomalous, peculiar, or local in the race prejudice that binds all Negroes together; but this clan spirit is a characteristic of all savage and semi-civilized peoples.

It should be well understood by this time that no foreign race inhabiting this country and acting together politically can dominate the native whites. To permit an inferior race, holding less than one tenth of the property of the community, to take the reins of government in its hands, by reason of mere numerical strength, would be to renounce civilization. Our national government, in making laws for Hawaii, has carefully provided for white supremacy by an educational qualification for suffrage that excludes the semi-civilized natives. No sane man, let us hope, would think of placing Manila under the control of a government of the Philippine Islands based upon universal suffrage. Yet the problem in the South and the problem in the Philippines and in Hawaii differ only in degree.

The only proper safeguard against Negro rule in States where the blacks outnumber or approximate in number the whites lies in constitutional provisions establishing an educational test for suffrage applicable to black and white alike. If the suffrage is not thus limited it is necessary for the whites to resort to technicalities and ballot laws, to bribery or intimidation. To set up an educational test with a "grandfather clause," making the test apply for a certain time to the blacks only, seems to an outsider unnecessary, arbitrary, and unjust. The reason for such a clause arises from the belief that no constitutional amendment could ever carry if it immediately disfranchised the illiterate whites, as many property-holding whites belong to that class. But the writer does not believe in the principle nor in the necessity for a "grandfather clause." If constitutional amendments were to be submitted in North Carolina and Virginia applying the educational test to both races alike after 1908, the question would be lifted above the level of party gain, and would receive the support of white men of all parties and the approbation of the moral sentiment of the American people. A white man who would disfranchise a Negro because of his color or for mere party advantage is himself unworthy of the suffrage. With the suffrage question adjusted upon an educational basis the Negroes would have the power to work out their political emancipation, the white people having made education necessary and provided the means for attaining it.

When the question of Negro domination is settled the path of progress of both races will be very much cleared. Race conflicts will then be less frequent and race feeling less bitter. With more friendly relations growing up, and with more concentration of energy on the part of the Negroes in industrial lines, the opportunities for them will be widened and the task of finding industrial adjustment in the struggle for life made easier. The wisest and best leaders among the Negroes, such as Booker Washington and the late Charles Price, have tried to turn the attention of the Negroes from politics to the more profitable pursuits of industry, and if the professional politician would cease inspiring the Negroes to seek salvation in political domination over the whites, the race issue would soon cease to exist.

The field is broad enough in the South for both races to attain all that is possible to them. In spite of the periodic political conflicts and occasional local riots and acts of individual violence, the relations between the races, in respect to nine tenths of the population, are very friendly. The general condition has been too often judged by the acts of a small minority. The Southern people understand the Negroes, and feel a real fondness for those that are thrifty and well behaved. When fairly treated the Negro has a strong affection for his employer. He seldom forgets a kindness, and is quick to forget a wrong. If he does not stay long at one place, it is not that he dislikes his employer so much as that he has a restless temperament and craves change. His disposition is full of mirth and sunshine, and not a little of the fine flavor of Southern wit and humor is due to his influence. His nature is plastic, and while he is easily molded into a monster, he is also capable of a high degree of culture. Many Negroes are thoroughly honest, notwithstanding their bad environment and hereditary disposition to steal. Negro servants are trusted with the keys to households to an extent that, probably, is not the case among domestics elsewhere in the civilized world.

It is strange that two races working side by side should possess so many opposite traits of character. The white man has strong will and convictions and is set in his ways. He lives an indoor, monotonous life, restrains himself like a Puritan, and is inclined to melancholy. The prevalence of Populism throughout the South is nothing but the outcome of this morbid tendency. Farmers and

merchants are entirely absorbed in their business, and the women, especially the married women, contrast with the women of France, Germany, and even England, in their indoor life and disinclination to mingle with the world outside. Public parks and public concerts, such as are found in Europe, which call out husband, wife, and children for a few hours of rest and communion with their friends, are almost unknown in the South. The few entertainments that receive sanction generally exclude all but the well-to-do by the cost of admission. The life of the poor in town and country is bleak and bare to the last degree.

Contrasting with this tendency is the free-and-easy life of the blacks. The burdens of the present and the future weigh lightly upon their shoulders. They love all the worldly amusements; in their homes they are free entertainers, and in their fondness for conversation and love of street life they are equal to the French or Italians.

May we not hope that the conflict of these two opposite races is working out some advantages to both, and that the final result will justify all that the conflict has cost?

SIGNS OF PROGRESS AMONG THE NEGROES by Booker T. Washington

In addition to the problem of educating eight million negroes in our Southern States and ingrafting them into American citizenship, we now have the additional responsibility, either directly or indirectly, of educating and elevating about eight hundred thousand others of African descent in Cuba and Porto Rico, to say nothing of the white people of these islands, many of whom are in a condition about as deplorable as that of the negroes. We have, however, one advantage in approaching the question of the education of our new neighbors.

The experience that we have passed through in the Southern States during the last thirty years in the education of my race, whose history and needs are not very different from the history and needs of the Cubans and Porto Ricans, will prove most valuable in elevating the blacks of the West Indian Islands. To tell what has already been accomplished in the South under most difficult circumstances is to tell what may be done in Cuba and Porto Rico.

To this end let me tell a story.

In what is known as the black belt of the South--that is, where the negroes outnumber the whites--there lived before the Civil War a white man who owned some two hundred slaves, and was prosperous. At the close of the war he found his fortune gone, except that which was represented in land, of which he owned several thousand acres. Of the two hundred slaves a large proportion decided, after their freedom, to continue on the plantation of their former owner.

Some years after the war a young black boy, who seemed to have "rained down," was discovered on the plantation by Mr. S-----, the owner. In daily rides through the plantation Mr. S----- saw this boy sitting by the roadside, and his condition awakened his pity, for, from want of care, he was covered from head to foot with sores, and Mr. S----- soon grew into the habit of tossing him a nickel or a dime as he rode by. In some way this boy heard of the Tuskegee Normal and Industrial Institute in Alabama, and of the advantages which it offered poor but deserving colored men and women to secure an education through their own labor while taking the course of study. This boy, whose name was William, made known to the plantation hands his wish to go to the Tuskegee school. By each one "chipping in," and through the efforts of the boy himself, a few decent pieces of clothing were secured, and a little money, but not enough to pay his railroad fare, so the boy resolved to walk to Tuskegee, a distance of about one hundred and fifty miles. Strange to say, he made the long distance with an expenditure of only twenty cents in cash. He frankly told every one with whom he came in contact where he was going and what he was seeking. Both white and colored people along the route gave him food and a place to sleep free of cost, and even the usually exacting ferrymen were so impressed with the young negro's desire for an education that, except in one case, he was given free ferriage across the creeks and rivers.

One can easily imagine his appearance when he first arrived at Tuskegee, with his blistered feet and small white bundle, which contained all the clothing he possessed.

On being shown into my office his first words were: "I's come. S'pose you been lookin' for me, but I didn't come on de railroad." Looking up the records, it was found that this young man had been given permission to come several months ago, but the correspondence had long since been forgotten.

After being sent to the bath-room and provided with a tooth-brush,--for the tooth-brush at Tuskegee is the emblem of civilization,--William was assigned to a room, and was given work on the school farm of fourteen hundred acres, seven hundred of which are cultivated by student labor. During his first year at Tuskegee William worked on the farm during the day, where he soon

learned to take a deep interest in all that the school was doing to teach the students the best and most improved methods of farming, and studied for two hours at night in the class-room after his hard day's work was over. At first he seemed drowsy and dull in the night-school, and would now and then fall asleep while trying to study; but he did not grow discouraged. The new machinery that he was compelled to use on the farm interested him because it taught him that the farm work could be stripped of much of the old-time drudgery and toil, and seemed to awaken his sleeping intellect. Soon he began asking the farm-instructors such questions as where the Jersey and Holstein cattle came from, and why they produced more milk and butter than the common long-tailed and long-horned cows that he had seen at home.

His night-school teachers found that he ceased to sleep in school, and began asking questions about his lessons, and was soon able to calculate the number of square yards in an acre and to tell the number of peach-trees required to plant an acre of land. After he had been at Tuskegee two or three months the farm-manager came into my office on a cold, rainy day, and said that William was virtually barefooted, the soles of his shoes having separated from the uppers, though William had fastened them together as best he could with bits of wire. In this condition the farm-instructor found him plowing without a word of complaint. A pair of second-hand shoes was secured for him, and he was soon very happy.

I will not take this part of the story further except to say that at the end of his first year at Tuskegee this young man, having made a start in his books, and having saved a small sum of money above the cost of his board, which was credited to his account, entered the next year our regular day-classes, though still dividing his time between the class-room and work on the farm.

Toward the end of the year he found himself in need of money with which to buy books, clothing, etc., and so wrote a carefully worded letter to Mr. S-----, the white man on whose plantation he had lived, and who had been, in slavery, the owner of his mother.

In the letter he told Mr. S----- how he got to Tuskegee, what he was doing, and what his needs were, and asked Mr. S----- to lend him fifteen dollars. Before receiving this letter Mr. S----- had not thought once about the boy during his two years' absence; in fact, did not know that he had left the plantation.

Mr. S----- was a good deal shocked, as well as amused, over such a request from such a source. The letter went to the wastebasket without being answered. A few weeks later William sent a second letter, in which he took it for granted that the first letter had not been received. The second letter shared the same fate as the first. A third letter reached Mr. S----- in a few weeks, making the same request. In answer to the third letter Mr. S----- told me that, moved by some impulse which he himself never understood, he sent William the fifteen dollars.

Two or three years passed, and Mr. S----- had about forgotten William and the fifteen dollars; but one morning while sitting upon his porch a bright young colored man walked up and introduced himself as William, the boy to whom he used to toss small pieces of money, and the one to whom he had sent fifteen dollars.

William paid Mr. S----- the fifteen dollars with interest, which he had earned while teaching school after leaving Tuskegee.

This simple experience with this young colored man made a new and different person of Mr. S-----, so far as the negro was concerned.

He began to think. He thought of the long past, but he thought most of the future, and of his duty toward the hundreds of colored people on his plantation and in his community. After careful thought he asked William Edwards to open a school on his plantation in a vacant log cabin. That was seven years ago. On this same plantation at Snow Hill, Wilcox county, Alabama, a county where, according to the last census, there are twenty-four thousand colored people and about six thousand whites, there is now a school with two hundred pupils, five teachers from Tuskegee, and three school buildings. The school has forty acres of land. In addition to the text-book lessons, the boys are taught farming and carpentry, and the girls sewing and general house-keeping, and the school is now in the act of starting a blacksmith and wheelwright department. This school owes its existence almost wholly to Mr. S-----, who gave to the trustees the forty acres of land, and has contributed liberally to the building fund, as well as to the pay of the teachers. Gifts from a few friends in the North have been received, and the colored people have given their labor and small sums in cash. When the people cannot find money to give, they have often given corn, chickens, and eggs. The school has grown so popular that almost every leading white man in the community is willing to make a small gift toward its maintenance.

In addition to the work done directly in the school for the children, the teachers in the Snow Hill school have organized a kind of university extension movement. The farmers are organized into conferences, which hold meetings each month. In these meetings they are taught better methods of agriculture, how to buy land, how to economize and keep out of debt, how to stop mortgaging,

how to build school-houses and dwelling-houses with more than one room, how to bring about a higher moral and religious standing, and are warned against buying cheap jewelry, snuff, and whisky.

No one is a more interested visitor at these meetings than Mr. S-----himself. The matter does not end in mere talk and advice. The women teachers go right into the cabins of the people and show them how to keep them clean, how to dust, sweep, and cook.

When William Edwards left this community a few years ago for the Tuskegee school, he left the larger proportion in debt, mortgaging their crops every year for the food on which to live. Most of them were living on rented land in small one-room log cabins, and attempting to pay an enormous rate of interest on the value of their food advances. As one old colored man expressed it, "I ain't got but six feet of land, and I is got to die to git dat." The little school taught in a cabin lasted only three or four months in the year. The religion was largely a matter of the emotions, with almost no practical ideas of morality. It was the white man for himself and the negro for himself, each in too many cases trying to take advantage of the other. The situation was pretty well described by a black man who said to me: "I tells you how we votes. We always watches de white man, and we keeps watchin' de white man. De nearer it gits to 'lection-time de more we watches de white man. We keeps watchin' de white man till we find out which way he gwine to vote; den we votes 'zactly de odder way. Den we knows we is right."

Now how changed is all at Snow Hill, and how it is gradually changing each year! Instead of the hopelessness and dejection that were there a few years ago, there are now light and buoyancy in the countenances and movements of the people. The negroes are getting out of debt and buying land, ceasing to mortgage their crops, building houses with two or three rooms, and a higher moral and religious standard has been established.

Last May, on the day that the school had its closing exercises, there were present, besides the hundreds of colored-people, about fifty of the leading white men and women of the county, and these white people seemed as much interested in the work of the school as the people of my own race.

Only a few years ago in the State of Alabama the law in reference to the education of the negro read as follows: "Any person or persons who shall attempt to teach any free person of color or slave to spell, read, or write shall, upon conviction thereof by indictment, be fined in a sum not less than two hundred and fifty dollars nor more than five hundred dollars."

Within half a dozen years I have heard Dr. J. L. M. Curry, a brave, honest ex-Confederate officer, in addressing both the Alabama and Georgia State legislatures, say to those bodies in the most emphatic manner that it was as much the duty of the State to educate the negro children as the white children, and in each case Dr. Curry's words were cheered.

Here at Snow Hill is the foundation for the solution of the legal and political difficulties that exist in the South, and the improvement of the industrial condition of the negro in Cuba and Porto Rico. This solution will not come all at once, but gradually. The foundation must exist in the commercial and industrial development of the people of my race in the South and in the West Indian Islands.

The most intelligent whites are beginning to realize that they cannot go much higher than they lift the negro at the same time. When a black man owns and cultivates the best farm to be found in his county he will have the confidence and respect of most of the white people in that county. When a black man is the largest taxpayer in his community his white neighbor will not object very long to his voting, and having that vote honestly counted. Even now a black man who has five hundred dollars to lend has no trouble in finding a white man who is willing to borrow his money. The negro who is a large stockholder in a railroad company will always be treated with justice on that railroad.

Many of the most intelligent colored people are learning that while there are many bad white men in the South, there are Southern whites who have the highest interests of the negro just as closely at heart as have any other people in any part of the country. Many of the negroes are learning that it is folly not to cultivate in every honorable way the friendship of the white man who is their next-door neighbor.

To describe the work being done in connection with the public schools by graduates of Tuskegee and other institutions in the South, at such places as Mount Meigs, under Miss Cornelia Bowen; Denmark, South Carolina; Abbeville and Newville, Alabama; Christiansburg, Virginia, and numbers of other places in the Gulf States, would be only to repeat in a larger or smaller degree what I have said of Snow Hill.

Not very long after the last national election I visited a town in the South, to speak at a meeting which had for its object the raising of money to complete the school-house. The audience was about equally divided between white men and women and black men and

women. When the time for the collection came it was intensely satisfactory to observe that the white side of the audience was just as eager to make its small contributions as were the members of my own race. But I was anxious to see how the late election had been conducted in that community. I soon found out that the Republican party, composed almost wholly of the black people, was represented by an election officer in the person of one of the best-educated colored men in the town, that both the Democratic and Populist parties were equally well represented, and that there was no suspicion of unfairness.

But I wished to go a little deeper, and I soon found that one of the leading stores in this community was owned by a colored man; that a cotton-gin was owned by a colored man; that the sawmill was owned by another colored man. Colored men had mortgages on white men's crops, and vice versa, and colored people not only owned land, but in several cases were renting land to white men. Black men were in debt to white men, and white men were in debt to black men. In a word, the industrial and commercial relations of the races were interwoven just as if all had been of one race.

An object-lesson in civilization is more potent in compelling people to act right than a law compelling them to do so. Some years ago a colored woman who had graduated at Tuskegee began her life-work in a Southern community where the force of white public sentiment was opposed to the starting of what was termed a "nigger school." At first this girl was tempted to abuse her white sister, but she remembered that perhaps the white woman had been taught from her earliest childhood, through reading and conversation, that education was not good for the negro, that it would result only in trouble to the community, and that no amount of abuse could change this prejudice.

After a while this colored teacher was married to an educated colored man, and they built a little cottage, which, in connection with her husband's farm, was a model. One morning one of the white women who had been most intense in her feelings was passing this cottage, and her attention was attracted to the colored woman who was at work in her beautiful flower-garden. A conversation took place concerning the flowers. At another time this same white woman was so attracted by this flower-garden that she came inside the yard, and from the yard she went into the sitting-room and examined the books and papers.

This acquaintance has now ripened and broadened, so that to-day there are few people in that community more highly respected than this colored family. What did it all? This object-lesson. No one could explain that away. One such object-lesson in every community in the South is more powerful than all the laws Congress can pass in the direction of bringing about right relations between blacks and whites.

A few months ago an agricultural county fair, the first ever held in that county, was organized and held at Calhoun, Alabama, by the teachers in the Calhoun School, which is an offshoot of the Hampton Institute. Both the colored people and numbers of white visitors were astonished at the creditable exhibits made by the colored people. Most of these white people saw the school work at Calhoun for the first time. Perhaps no amount of abstract talk or advice could have brought them to this school, but the best hog, the largest pumpkin, or the most valuable bale of cotton possessed a common interest, and it has been a comparatively easy thing to extend their interest from the best hog to the work being done in the school-room. Further, this fair convinced these white people, as almost nothing else could have done, that education was making the negroes better citizens rather than worse; that the people were not being educated away from themselves, but with their elevation the conditions about them were being lifted in a manner that possessed an interest and value for both races.

It was after speaking, not long ago, to the colored people at such a county fair in North Carolina that I was asked the next morning to speak to the white students at their college, who gave me as hearty a greeting as I have ever received at Northern colleges.

But such forces as I have described--forces that are gradually regenerating the entire South and will regenerate Cuba and Porto Rico--are not started and kept in motion without a central plant--a power-house, where the power is generated. I cannot describe all these places of power. Perhaps the whole South and the whole country are most indebted to the Hampton Institute in Virginia. Then there is Fisk University at Nashville, Tennessee; Talladega College at Talladega, Alabama; Spelman Seminary, Atlanta University, and Atlanta Baptist College at Atlanta; Biddle University in North Carolina; Claflin University at Orangeburg, South Carolina; and Knoxville College at Knoxville, Tennessee. Some of these do a different grade of work, but one much needed.

At Tuskegee, Alabama, starting fifteen years ago in a little shanty with one teacher and thirty students, with no property, there has grown up an industrial and educational village where the ideas that I have referred to are put into the heads, hearts, and hands of an army of colored men and women, with the purpose of having them become centers of light and civilization in every part of the South. One visiting the Tuskegee Normal and Industrial Institute to-day will find eight hundred and fifty students gathered from twenty-four States, with eighty-eight teachers and officers training these students in literary, religious, and industrial work.

Counting the students and the families of the instructors, the visitor will find a black village of about twelve hundred people. Instead of the old, worn-out plantation that was there fifteen years ago, there is a modern farm of seven hundred acres cultivated by student labor. There are Jersey and Holstein cows and Berkshire pigs, and the butter used is made by the most modern process.

Aside from the dozens of neat, comfortable cottages owned by individual teachers and other persons, who have settled in this village for the purpose of educating their children, he will find thirty-six buildings of various kinds and sizes, owned and built by the school, property valued at three hundred thousand dollars. Perhaps the most interesting thing in connection with these buildings is that, with the exception of three, they have been built by student labor. The friends of the school have furnished money to pay the teachers and for material.

When a building is to be erected, the teacher in charge of the mechanical and architectural drawing department gives to the class in drawing a general description of the building desired, and then there is a competition to see whose plan will be accepted. These same students in most cases help do the practical work of putting up the building--some at the sawmill, the brick-yard, or in the carpentry, brickmaking, plastering, painting, and tinsmithing departments. At the same time care is taken to see not only that the building goes up properly, but that the students, who are under intelligent instructors in their special branch, are taught at the same time the principles as well as the practical part of the trade.

The school has the building in the end, and the students have the knowledge of the trade. This same principle applies, whether in the laundry, where the washing for seven or eight hundred people is done, or in the sewing-room, where a large part of the clothing for this colony is made and repaired, or in the wheelwright and blacksmith departments, where all the wagons and buggies used by the school, besides a large number for the outside public, are manufactured, or in the printing-office, where a large part of the printing for the white and colored people in this region is done. Twenty-six different industries are here in constant operation.

When the student is through with his course of training he goes out feeling that it is just as honorable to labor with the hand as with the head, and instead of his having to look for a place, the place usually seeks him, because he has to give that which the South wants. One other thing should not be overlooked in our efforts to develop the black man. As bad as slavery was, almost every large plantation in the South during that time was, in a measure, an industrial school. It had its farming department, its blacksmith, wheelwright, brickmaking, carpentry, and sewing departments. Thus at the close of the war our people were in possession of all the common and skilled labor in the South. For nearly twenty years after the war we overlooked the value of the ante-bellum training, and no one was trained to replace these skilled men and women who were soon to pass away; and now, as skilled laborers from foreign countries, with not only educated hands but trained brains, begin to come into the South and take these positions once held by us, we are gradually waking up to the fact that we must compete with the white man in the industrial world if we would hold our own. No one understands his value in the labor world better than the old colored man. Recently, when a convention was held in the South by the white people for the purpose of inducing white settlers from the North and West to settle in the South, one of these colored men said to the president of the convention: "'Fore de Lord, boss, we's got as many white people down here now as we niggers can support."

The negro in the South has another advantage. While there is prejudice against him along certain lines,--in the matter of business in general, and the trades especially,--there is virtually no prejudice so far as the native Southern white man is concerned. White men and black men work at the same carpenter's bench and on the same brick wall. Sometimes the white man is the "boss," sometimes the black man is the boss.

Some one chaffed a colored man recently because, when he got through with a contract for building a house, he cleared just ten cents; but he said: "All right, boss; it was worth ten cents to be de boss of dem white men." If a Southern white man has a contract to let for the building of a house, he prefers the black contractor, because he has been used to doing business of this character with a negro rather than with a white man.

The negro will find his way up as a man just in proportion as he makes himself valuable, possesses something that a white man wants, can do something as well as, or better than, a white man.

I would not have my readers get the thought that the problem in the South is settled, that there is nothing else to be done; far from this. Long years of patient, hard work will be required for the betterment of the condition of the negro in the South, as well as for the betterment of the condition of the negro in the West Indies.

There are bright spots here and there that point the way. Perhaps the most that we have accomplished in the last thirty years is to show the North and the South how the fourteen slaves landed a few hundred years ago at Jamestown, Virginia,--now nearly eight millions of freemen in the South alone,--are to be made a safe and useful part of our democratic and Christian institutions.

The main thing that is now needed to bring about a solution of the difficulties in the South is money in large sums, to be used largely for Christian, technical, and industrial education.

For more than thirty years we have been trying to solve one of the most serious problems in the history of the world largely by passing around a hat in the North. Out of their poverty the Southern States have done well in assisting; many more millions are needed, and these millions will have to come before the question as to the negro in the South is settled.

There never was a greater opportunity for men of wealth to place a few million dollars where they could be used in lifting up and regenerating a whole race; and let it always be borne in mind that every dollar given for the proper education of the negro in the South is almost as much help to the Southern white man as to the negro himself. So long as the whites in the South are surrounded by a race that is, in a large measure, in ignorance and poverty, so long will this ignorance and poverty of the negro in a score of ways prevent the highest development of the white man.

The problem of lifting up the negro in Cuba and Porto Rico is an easier one in one respect, even if it proves more difficult in others. It will be less difficult, because there is the absence of that higher degree of race feeling which exists in many parts of the United States. Both the white Cuban and the white Spaniard have treated the people of African descent, in civil, political, military, and business matters, very much as they have treated others of their own race. Oppression has not cowed and unmanned the Cuban negro in certain respects as it has the American negro.

In only a few instances is the color-line drawn. How Americans will treat the negro Cuban, and what will be the tendency of American influences in the matter of the relation of the races, remains an interesting and open question. Certainly it will place this country in an awkward position to have gone to war to free a people from Spanish cruelty, and then as soon as it gets them within its power to treat a large proportion of the population worse than did even Spain herself, simply on account of color.

While in the matter of the relation of the races the problem before us in the West Indies is easier, in respect to the industrial, moral, and religious sides it is more difficult. The negroes on these islands are largely an agricultural people, and for this reason, in addition to a higher degree of mental and religious training, they need the same agricultural, mechanical, and domestic training that is fast helping the negroes in our Southern States. Industrial training will not only help them to the ownership of property, habits of thrift and economy, but the acquiring of these elements of strength will go further than anything else in improving the moral and religious condition of the masses, just as has been and is true of my people in the Southern States.

With the idea of getting the methods of industrial education pursued at Hampton and Tuskegee permanently and rightly started in Cuba and Porto Rico, a few of the most promising men and women from these islands have been brought to the Tuskegee Normal and Industrial Institute, and educated with the view of having them return and take the lead in affording industrial training on these islands, where the training can best be given to the masses.

The emphasis that I have placed upon an industrial education does not mean that the negro is to be excluded from the higher interests of life, but it does mean that in proportion as the negro gets the foundation,--the useful before the ornamental,--in the same proportion will he accelerate his progress in acquiring those elements which do not pertain so directly to the utilitarian.

Phillips Brooks once said, "One generation gathers the material, and the next builds the palaces." Very largely this must be the material-gathering generation of black people, but in due time the palaces will come if we are patient.

THE MARCH OF PROGRESS by Charles W. Chesnutt

The colored people of Patesville had at length gained the object they had for a long time been seeking--the appointment of a committee of themselves to manage the colored schools of the town. They had argued, with some show of reason, that they were most interested in the education of their own children, and in a position to know, better than any committee of white men could, what was best for their children's needs. The appointments had been made by the county commissioners during the latter part of the summer, and a week later a meeting was called for the purpose of electing a teacher to take charge of the grammar school at the beginning of the fall term.

The committee consisted of Frank Gillespie, or "Glaspy," a barber, who took an active part in local politics; Bob Cotten, a blacksmith, who owned several houses and was looked upon as a substantial citizen; and Abe Johnson, commonly called "Ole Abe" or "Uncle Abe," who had a large family, and drove a dray, and did odd jobs of hauling; he was also a class-leader in the Methodist church. The committee had been chosen from among a number of candidates--Gillespie on account of his political standing, Cotten as representing the solid element of the colored population, and Old Abe, with democratic impartiality, as likely to satisfy the humbler class of a humble people. While the choice had not pleased everybody,--for instance, some of the other applicants,--it was acquiesced in with general satisfaction. The first meeting of the new committee was of great public interest, partly by reason of its novelty, but chiefly because there were two candidates for the position of teacher of the grammar school.

The former teacher, Miss Henrietta Noble, had applied for the school. She had taught the colored children of Patesville for fifteen years. When the Freedmen's Bureau, after the military occupation of North Carolina, had called for volunteers to teach the children of the freedmen, Henrietta Nobel had offered her services. Brought up in a New England household by parents who taught her to fear God and love her fellow-men, she had seen her father's body brought home from a Southern battle-field and laid to rest in the village cemetery; and a short six months later she had buried her mother by his side. Henrietta had no brothers or sisters, and her nearest relatives were cousins living in the far West. The only human being in whom she felt any special personal interest was a certain captain in her father's regiment, who had paid her some attention. She had loved this man deeply, in a maidenly, modest way; but he had gone away without speaking, and had not since written. He had escaped the fate of many others, and at the close of the war was alive and well, stationed in some Southern garrison.

When her mother died, Henrietta had found herself possessed only of the house where she lived and the furniture it contained, neither being of much value, and she was thrown upon her own resources for a livelihood. She had a fair education and had read many good books. It was not easy to find employment such as she desired. She wrote to her Western cousins, and they advised her to come to them, as they thought they could do something for her if she were there. She had almost decided to accept their offer, when the demand arose for teachers in the South. Whether impelled by some strain of adventurous blood from a Pilgrim ancestry, or by a sensitive pride that shrank from dependence, or by some dim and unacknowledged hope that she might sometime, somewhere, somehow meet Captain Carey--whether from one of these motives or a combination of them all, joined to something of the missionary spirit, she decided to go South, and wrote to her cousins declining their friendly offer.

She had come to Patesville when the children were mostly a mob of dirty little beggars. She had distributed among them the cast-off clothing that came from their friends in the North; she had taught them to wash their faces and to comb their hair; and patiently, year after year, she had labored to instruct them in the rudiments of learning and the first principles of religion and morality. And she had not wrought in vain. Other agencies, it is true, had in time cooperated with her efforts, but any one who had watched the current of events must have been compelled to admit that the very fair progress of the colored people of Patesville in the fifteen years following emancipation had been due chiefly to the unselfish labors of Henrietta Noble, and that her nature did not belie her name.

Fifteen years is a long time. Miss Noble had never met Captain Carey; and when she learned later that he had married a Southern girl in the neighborhood of his post, she had shed her tears in secret and banished his image from her heart. She had lived a lonely life. The white people of the town, though they learned in time to respect her and to value her work, had never recognized her existence by more than the mere external courtesy shown by any community to one who lives in the midst of it. The situation was at first, of course, so strained that she did not expect sympathy from the white people; and later, when time had smoothed over some of the asperities of war, her work had so engaged her that she had not had time to pine over her social exclusion. Once or twice nature had asserted itself, and she had longed for her own kind, and had visited her New England home. But her circle of friends was broken up, and she did not find much pleasure in boarding-house life; and on her last visit to the North but one, she had felt so lonely that she had longed for the dark faces of her pupils, and had welcomed with pleasure the hour when her task should be resumed.

But for several reasons the school at Patesville was of more importance to Miss Noble at this particular time than it ever had been before. During the last few years her health had not been good. An affection of the heart similar to that from which her mother had died, while not interfering perceptibly with her work, had grown from bad to worse, aggravated by close application to her duties, until it had caused her grave alarm. She did not have perfect confidence in the skill of the Patesville physicians, and to obtain the best medical advice had gone to New York during the summer, remaining there a month under the treatment of an eminent specialist. This, of course, had been expensive and had absorbed the savings of years from a small salary; and when the time came for her to return to Patesville, she was reduced, after paying her traveling expenses, to her last ten-dollar note.

"It is very fortunate," the great man had said at her last visit, "that circumstances permit you to live in the South, for I am afraid you could not endure a Northern winter. You are getting along very well now, and if you will take care of yourself and avoid excitement, you will be better." He said to himself as she went away: "It's only a matter of time, but that is true about us all; and a wise physician does as much good by what he withholds as by what he tells."

Miss Noble had not anticipated any trouble about the school. When she went away the same committee of white men was in charge that had controlled the school since it had become part of the public-school system of the State on the withdrawal of support from the Freedmen's Bureau. While there had been no formal engagement made for the next year, when she had last seen the chairman before she went away, he had remarked that she was looking rather fagged out, had bidden her good-by, and had hoped to see her much improved when she returned. She had left her house in the care of the colored woman who lived with her and did her housework, assuming, of course, that she would take up her work again in the autumn.

She was much surprised at first, and later alarmed, to find a rival for her position as teacher of the grammar school. Many of her friends and pupils had called on her since her return, and she had met a number of the people at the colored Methodist church, where she taught in the Sunday-school. She had many friends and supporters, but she soon found out that her opponent had considerable strength. There had been a time when she would have withdrawn and left him a clear field, but at the present moment it was almost a matter of life and death to her--certainly the matter of earning a living--to secure the appointment.

The other candidate was a young man who in former years had been one of Miss Noble's brightest pupils. When he had finished his course in the grammar school, his parents, with considerable sacrifice, had sent him to a college for colored youth. He had studied diligently, had worked industriously during his vacations, sometimes at manual labor, sometimes teaching a country school, and in due time had been graduated from his college with honors. He had come home at the end of his school life, and was very naturally seeking the employment for which he had fitted himself. He was a "bright" mulatto, with straight hair, an intelligent face, and a well-set figure. He had acquired some of the marks of culture, wore a frock-coat and a high collar, parted his hair in the middle, and showed by his manner that he thought a good deal of himself. He was the popular candidate among the progressive element of his people, and rather confidently expected the appointment.

The meeting of the committee was held in the Methodist church, where, in fact, the grammar school was taught, for want of a separate school-house. After the preliminary steps to effect an organization, Mr. Gillespie, who had been elected chairman, took the floor.

"The principal business to be brought befo' the meet'n' this evenin'," he said, "is the selection of a teacher for our grammar school for the ensuin' year. Two candidates have filed applications, which, if there is no objection, I will read to the committee. The first is from Miss Noble, who has been the teacher ever since the grammar school was started."

He then read Miss Noble's letter, in which she called attention to her long years of service, to her need of the position, and to her affection for the pupils, and made formal application for the school for the next year. She did not, from motives of self-respect, make known the extremity of her need; nor did she mention the condition of her health, as it might have been used as an argument against her retention.

Mr. Gillespie then read the application of the other candidate, Andrew J. Williams. Mr. Williams set out in detail his qualifications for the position: his degree from Riddle University; his familiarity with the dead and living languages and the higher mathematics; his views of discipline; and a peroration in which he expressed the desire to devote himself to the elevation of his race and assist the march of progress through the medium of the Patesville grammar school. The letter was well written in a bold, round hand, with many flourishes, and looked very aggressive and overbearing as it lay on the table by the side of the sheet of small note-paper in Miss Noble's faint and somewhat cramped handwriting.

"You have heard the readin' of the applications," said the chairman. "Gentlemen, what is yo' pleasure?"

There being no immediate response, the chairman continued:

"As this is a matter of consid'able importance, involvin' not only the welfare of our schools, but the progress of our race, an' as our action is liable to be criticized, whatever we decide, perhaps we had better discuss the subjec' befo' we act. If nobody else has anything to obse've, I will make a few remarks."

Mr. Gillespie cleared his throat, and, assuming an oratorical attitude, proceeded:

"The time has come in the history of our people when we should stand together. In this age of organization the march of progress requires that we help ourselves, or be forever left behind. Ever since the war we have been sendin' our child'n to school an' educatin' 'em; an' now the time has come when they are leavin' the schools an' colleges, an' are ready to go to work. An' what are they goin' to do? The white people won't hire 'em as clerks in their sto's an' factories an' mills, an' we have no sto's or factories or mills of our own. They can't be lawyers or doctors yet, because we haven't got the money to send 'em to medical colleges an' law schools. We can't elect many of 'em to office, for various reasons. There's just two things they can find to do--to preach in our own pulpits, an' teach in our own schools. If it wasn't for that, they'd have to go on forever waitin' on white folks, like their fo'fathers have done, because they couldn't help it. If we expect our race to progress, we must educate our young men an' women. If we want to encourage 'em to get education, we must find 'em employment when they are educated. We have now an opportunity to do this in the case of our young friend an' fellow-citizen, Mr. Williams, whose eloquent an' fine-lookin' letter ought to make us feel proud of him an' of our race.

"Of co'se there are two sides to the question. We have got to consider the claims of Miss Noble. She has been with us a long time an' has done much good work for our people, an' we'll never forget her work an' frien'ship. But, after all, she has been paid for it; she has got her salary regularly an' for a long time, an' she has probably saved somethin', for we all know she hasn't lived high; an', for all we know, she may have had somethin' left her by her parents. An' then again, she's white, an' has got her own people to look after her; they've got all the money an' all the offices an' all the everythin',--all that they've made an' all that we've made for fo' hundred years,--an' they sho'ly would look out for her. If she don't get this school, there's probably a dozen others she can get at the North. An' another thing: she is gettin' rather feeble, an' it 'pears to me she's hardly able to stand teachin' so many child'n, an' a long rest might be the best thing in the world for her.

"Now, gentlemen, that's the situation. Shall we keep Miss Noble, or shall we stand by our own people? It seems to me there can hardly be but one answer. Self-preservation is the first law of nature. Are there any other remarks?"

Old Abe was moving restlessly in his seat. He did not say anything, however, and the chairman turned to the other member.

"Brother Cotten, what is yo' opinion of the question befo' the board?"

Mr. Cotten rose with the slowness and dignity becoming a substantial citizen, and observed:

"I think the remarks of the chairman have great weight. We all have nothin' but kind feelin's fer Miss Noble, an' I came here to-night somewhat undecided how to vote on this question. But after listenin' to the just an' forcible arguments of Brother Glaspy, it 'pears to me that, after all, the question befo' us is not a matter of feelin', but of business. As a business man, I am inclined to think Brother Glaspy is right. If we don't help ourselves when we get a chance, who is goin' to help us?"

"That bein' the case," said the chairman, "shall we proceed to a vote? All who favor the election of Brother Williams--"

At this point Old Abe, with much preliminary shuffling, stood up in his place and interrupted the speaker.

"Mr. Chuhman," he said, "I s'pose I has a right ter speak in dis meet'n? I S'POSE I is a member er dis committee?"

"Certainly, Brother Johnson, certainly; we shall be glad to hear from you."

"I s'pose I's got a right ter speak my min', ef I is po' an' black, an' don' weah as good clo's as some other members er de committee?"

"Most assuredly, Brother Johnson," answered the chairman, with a barber's suavity, "you have as much right to be heard as any one else. There was no intention of cuttin' you off."

"I s'pose," continued Abe, "dat a man wid fo'teen child'n kin be 'lowed ter hab somethin' ter say 'bout de schools er dis town?"

"I am sorry, Brother Johnson, that you should feel slighted, but there was no intention to igno' yo' rights. The committee will be please' to have you ventilate yo' views."

"Ef it's all be'n an' done reco'nized an' 'cided dat I's got de right ter be heared in dis meet'n', I'll say w'at I has ter say, an' it won't take me long ter say it. Ef I should try ter tell all de things dat Miss Noble has done fer de niggers er dis town, it'd take me till ter-morrer mawnin'. Fer fifteen long yeahs I has watched her incomin's an' her outgoin's. Her daddy was a Yankee kunnel, who died fighting fer ou' freedom. She come heah when we--yas, Mr. Chuhman, when you an' Br'er Cotten--was jes sot free, an' when

none er us didn' have a rag ter ou' backs. She come heah, an' she tuk yo' child'n an' my child'n, an' she teached 'em sense an' manners an' religion an' book-l'arnin'. When she come heah we didn' hab no chu'ch. Who writ up No'th an' got a preacher sent to us, an' de fun's ter buil' dis same chu'ch-house we're settin' in ter-night? Who got de money f'm de Bureau to s'port de school? An' when dat was stop', who got de money f'm de Peabody Fun'? Talk about Miss Noble gittin' a sal'ry! Who paid dat sal'ry up ter five years ago? Not one dollah of it come outer ou' pockets!

"An' den, w'at did she git fer de yuther things she done? Who paid her fer de gals she kep' f'm throwin' deyse'ves away? Who paid fer de boys she kep' outer jail? I had a son dat seemed to hab made up his min' ter go straight ter hell. I made him go ter Sunday-school, an' somethin' dat woman said teched his heart, an' he behaved hisse'f, an' I ain' got no reason fer ter be 'shame' er 'im. An' I can 'member, Br'er Cotten, when you didn' own fo' houses an' a fahm. An' when yo' fus wife was sick, who sot by her bedside an' read de Good Book ter 'er, w'en dey wuzn' nobody else knowed how ter read it, an' comforted her on her way across de col', dahk ribber? An' dat ain' all I kin 'member, Mr. Chuhman! When yo' gal Fanny was a baby, an' sick, an' nobody knowed what was de matter wid 'er, who sent fer a doctor, an' paid 'im fer comin', an' who he'ped nuss dat chile, an' tol' yo' wife w'at ter do, an' save' dat chile's life, jes as sho' as de Lawd has save' my soul?

"An' now, aftuh fifteen yeahs o' slavin' fer us, who ain't got no claim on her, aftuh fifteen yeahs dat she has libbed 'mongs' us an' made herse'f one of us, an' endyoed havin' her own people look down on her, aftuh she has growed ole an' gray wukkin' fer us an' our child'n, we talk erbout turnin' 'er out like a' ole hoss ter die! It 'pears ter me some folks has po' mem'ries! Whar would we 'a' be'n ef her folks at de No'th hadn' 'membered us no bettuh? An' we hadn' done nothin', neither, fer dem to 'member us fer. De man dat kin fergit w'at Miss Noble has done fer dis town is unworthy de name er nigger! He oughter die an' make room fer some 'spectable dog!

"Br'er Glaspy says we got a' educated young man, an' we mus' gib him sump'n' ter do. Let him wait; ef I reads de signs right he won't hab ter wait long fer dis job. Let him teach in de primary schools, er in de country; an' ef he can't do dat, let 'im work awhile. It don't hahm a' educated man ter work a little; his fo'fathers has worked fer hund'eds of years, an' we's worked, an' we're heah yet, an' we're free, an' we's gettin' ou' own houses an' lots an' hosses an' cows--an' ou' educated young men. But don't let de fus thing we do as a committee be somethin' we ought ter be 'shamed of as long as we lib. I votes fer Miss Noble, fus, las', an' all de time!"

When Old Abe sat down the chairman's face bore a troubled look. He remembered how his baby girl, the first of his children that he could really call his own, that no master could hold a prior claim upon, lay dying in the arms of his distracted young wife, and how the thin, homely, and short-sighted white teacher had come like an angel into his cabin, and had brought back the little one from the verge of the grave. The child was a young woman now, and Gillespie had well-founded hopes of securing the superior young Williams for a son-in-law; and he realized with something of shame that this later ambition had so dazzled his eyes for a moment as to obscure the memory of earlier days.

Mr. Cotten, too, had not been unmoved, and there were tears in his eyes as he recalled how his first wife, Nancy, who had borne with him the privations of slavery, had passed away, with the teacher's hand in hers, before she had been able to enjoy the fruits of liberty. For they had loved one another much, and her death had been to them both a hard and bitter thing. And, as Old Abe spoke, he could remember, as distinctly as though they had been spoken but an hour before, the words of comfort that the teacher had whispered to Nancy in her dying hour and to him in his bereavement.

"On consideration, Mr. Chairman," he said, with an effort to hide a suspicious tremor in his voice and to speak with the dignity consistent with his character as a substantial citizen, "I wish to record my vote fer Miss Noble."

"The chair," said Gillespie, yielding gracefully to the majority, and greatly relieved that the responsibility of his candidate's defeat lay elsewhere, "will make the vote unanimous, and will appoint Brother Cotten and Brother Johnson a committee to step round the corner to Miss Noble's and notify her of her election."

The two committeemen put on their hats, and, accompanied by several people who had been waiting at the door to hear the result of the meeting, went around the corner to Miss Noble's house, a distance of a block or two away. The house was lighted, so they knew she had not gone to bed. They went in at the gate, and Cotten knocked at the door.

The colored maid opened it.

"Is Miss Noble home?" said Cotten.

"Yes; come in. She's waitin' ter hear from the committee."

The woman showed them into the parlor. Miss Noble rose from her seat by the table, where she had been reading, and came forward to meet them. They did not for a moment observe, as she took a step toward them, that her footsteps wavered. In her agitation she was scarcely aware of it herself.

"Miss Noble," announced Cotten, "we have come to let you know that you have be'n 'lected teacher of the grammar school fer the next year."

"Thank you; oh, thank you so much!" she said. "I am very glad. Mary"--she put her hand to her side suddenly and tottered--"Mary, will you--"

A spasm of pain contracted her face and cut short her speech. She would have fallen had Old Abe not caught her and, with Mary's help, laid her on a couch.

The remedies applied by Mary, and by the physician who was hastily summoned, proved unavailing. The teacher did not regain consciousness.

If it be given to those whose eyes have closed in death to linger regretfully for a while about their earthly tenement, or from some higher vantage-ground to look down upon it, then Henrietta Noble's tolerant spirit must have felt, mingling with its regret, a compensating thrill of pleasure; for not only those for whom she had labored sorrowed for her, but the people of her own race, many of whom, in the blindness of their pride, would not admit during her life that she served them also, saw so much clearer now that they took charge of her poor clay, and did it gentle reverence, and laid it tenderly away amid the dust of their own loved and honored dead.

TWO weeks after Miss Noble's funeral the other candidate took charge of the grammar school, which went on without any further obstacles to the march of progress.

THE FREEDMEN'S BUREAU by W. E. Burghardt Du Bois

The problem of the twentieth century is the problem of the color line; the relation of the darker to the lighter races of men in Asia and Africa, in America and the islands of the sea. It was a phase of this problem that caused the Civil War; and however much they who marched south and north in 1861 may have fixed on the technical points of union and local autonomy as a shibboleth, all nevertheless knew, as we know, that the question of Negro slavery was the deeper cause of the conflict. Curious it was, too, how this deeper question ever forced itself to the surface, despite effort and disclaimer. No sooner had Northern armies touched Southern soil than this old question, newly guised, sprang from the earth,--What shall be done with slaves? Peremptory military commands, this way and that, could not answer the query; the Emancipation Proclamation seemed but to broaden and intensify the difficulties; and so at last there arose in the South a government of men called the Freedmen's Bureau, which lasted, legally, from 1865 to 1872, but in a sense from 1861 to 1876, and which sought to settle the Negro problems in the United States of America.

It is the aim of this essay to study the Freedmen's Bureau,--the occasion of its rise, the character of its work, and its final success and failure,--not only as a part of American history, but above all as one of the most singular and interesting of the attempts made by a great nation to grapple with vast problems of race and social condition.

No sooner had the armies, east and west, penetrated Virginia and Tennessee than fugitive slaves appeared within their lines. They came at night, when the flickering camp fires of the blue hosts shone like vast unsteady stars along the black horizon: old men, and thin, with gray and tufted hair; women with frightened eyes, dragging whimpering, hungry children; men and girls, stalwart and gaunt,--a horde of starving vagabonds, homeless, helpless, and pitiable in their dark distress. Two methods of treating these newcomers seemed equally logical to opposite sorts of minds. Said some, "We have nothing to do with slaves." "Hereafter," commanded Halleck, "no slaves should be allowed to come into your lines at all; if any come without your knowledge, when owners call for them, deliver them." But others said, "We take grain and fowl; why not slaves?" Whereupon Fremont, as early as August, 1861, declared the slaves of Missouri rebels free. Such radical action was quickly countermanded, but at the same time the opposite policy could not be enforced; some of the black refugees declared themselves freemen, others showed their masters had deserted them, and still others were captured with forts and plantations. Evidently, too, slaves were a source of strength to the Confederacy, and were being used as laborers and producers. "They constitute a military resource," wrote the Secretary of War, late in 1861; "and being such, that they should not be turned over to the enemy is too plain to discuss." So the tone of the army

chiefs changed, Congress forbade the rendition of fugitives, and Butler's "contrabands" were welcomed as military laborers. This complicated rather than solved the problem; for now the scattering fugitives became a steady stream, which flowed faster as the armies marched.

Then the long-headed man, with care-chiseled face, who sat in the White House, saw the inevitable, and emancipated the slaves of rebels on New Year's, 1863. A month later Congress called earnestly for the Negro soldiers whom the act of July, 1862, had half grudgingly allowed to enlist. Thus the barriers were leveled, and the deed was done. The stream of fugitives swelled to a flood, and anxious officers kept inquiring: "What must be done with slaves arriving almost daily? Am I to find food and shelter for women and children?"

It was a Pierce of Boston who pointed out the way, and thus became in a sense the founder of the Freedmen's Bureau. Being specially detailed from the ranks to care for the freedmen at Fortress Monroe, he afterward founded the celebrated Port Royal experiment and started the Freedmen's Aid Societies. Thus, under the timid Treasury officials and bold army officers, Pierce's plan widened and developed. At first, the able-bodied men were enlisted as soldiers or hired as laborers, the women and children were herded into central camps under guard, and "superintendents of contrabands" multiplied here and there. Centres of massed freedmen arose at Fortress Monroe, Va., Washington, D. C., Beaufort and Port Royal, S. C., New Orleans, La., Vicksburg and Corinth, Miss., Columbus, Ky., Cairo, Ill., and elsewhere, and the army chaplains found here new and fruitful fields.

Then came the Freedmen's Aid Societies, born of the touching appeals for relief and help from these centres of distress. There was the American Missionary Association, sprung from the Amistad, and now full grown for work, the various church organizations, the National Freedmen's Relief Association, the American Freedmen's Union, the Western Freedmen's Aid Commission,--in all fifty or more active organizations, which sent clothes, money, school-books, and teachers southward. All they did was needed, for the destitution of the freedmen was often reported as "too appalling for belief," and the situation was growing daily worse rather than better.

And daily, too, it seemed more plain that this was no ordinary matter of temporary relief, but a national crisis; for here loomed a labor problem of vast dimensions. Masses of Negroes stood idle, or, if they worked spasmodically, were never sure of pay; and if perchance they received pay, squandered the new thing thoughtlessly. In these and in other ways were camp life and the new liberty demoralizing the freedmen. The broader economic organization thus clearly demanded sprang up here and there as accident and local conditions determined. Here again Pierce's Port Royal plan of leased plantations and guided workmen pointed out the rough way. In Washington, the military governor, at the urgent appeal of the superintendent, opened confiscated estates to the cultivation of the fugitives, and there in the shadow of the dome gathered black farm villages. General Dix gave over estates to the freedmen of Fortress Monroe, and so on through the South. The government and the benevolent societies furnished the means of cultivation, and the Negro turned again slowly to work. The systems of control, thus started, rapidly grew, here and there, into strange little governments, like that of General Banks in Louisiana, with its 90,000 black subjects, its 50,000 guided laborers, and its annual budget of $100,000 and more. It made out 4000 pay rolls, registered all freedmen, inquired into grievances and redressed them, laid and collected taxes, and established a system of public schools. So too Colonel Eaton, the superintendent of Tennessee and Arkansas, ruled over 100,000, leased and cultivated 7000 acres of cotton land, and furnished food for 10,000 paupers. In South Carolina was General Saxton, with his deep interest in black folk. He succeeded Pierce and the Treasury officials, and sold forfeited estates, leased abandoned plantations, encouraged schools, and received from Sherman, after the terribly picturesque march to the sea, thousands of the wretched camp followers.

Three characteristic things one might have seen in Sherman's raid through Georgia, which threw the new situation in deep and shadowy relief: the Conqueror, the Conquered, and the Negro. Some see all significance in the grim front of the destroyer, and some in the bitter sufferers of the lost cause. But to me neither soldier nor fugitive speaks with so deep a meaning as that dark and human cloud that clung like remorse on the rear of those swift columns, swelling at times to half their size, almost engulfing and choking them. In vain were they ordered back, in vain were bridges hewn from beneath their feet; on they trudged and writhed and surged, until they rolled into Savannah, a starved and naked horde of tens of thousands. There too came the characteristic military remedy: "The islands from Charleston south, the abandoned ricefields along the rivers for thirty miles back from the sea, and the country bordering the St. John's River, Florida, are reserved and set apart for the settlement of Negroes now made free by act of war." So read the celebrated field order.

All these experiments, orders, and systems were bound to attract and perplex the government and the nation. Directly after the Emancipation Proclamation, Representative Eliot had introduced a bill creating a Bureau of Emancipation, but it was never

reported. The following June, a committee of inquiry, appointed by the Secretary of War, reported in favor of a temporary bureau for the "improvement, protection, and employment of refugee freedmen," on much the same lines as were afterward followed. Petitions came in to President Lincoln from distinguished citizens and organizations, strongly urging a comprehensive and unified plan of dealing with the freedmen, under a bureau which should be "charged with the study of plans and execution of measures for easily guiding, and in every way judiciously and humanely aiding, the passage of our emancipated and yet to be emancipated blacks from the old condition of forced labor to their new state of voluntary industry."

Some half-hearted steps were early taken by the government to put both freedmen and abandoned estates under the supervision of the Treasury officials. Laws of 1863 and 1864 directed them to take charge of and lease abandoned lands for periods not exceeding twelve months, and to "provide in such leases or otherwise for the employment and general welfare" of the freedmen. Most of the army officers looked upon this as a welcome relief from perplexing "Negro affairs;" but the Treasury hesitated and blundered, and although it leased large quantities of land and employed many Negroes, especially along the Mississippi, yet it left the virtual control of the laborers and their relations to their neighbors in the hands of the army.

In March, 1864, Congress at last turned its attention to the subject, and the House passed a bill, by a majority of two, establishing a Bureau for Freedmen in the War Department. Senator Sumner, who had charge of the bill in the Senate, argued that freedmen and abandoned lands ought to be under the same department, and reported a substitute for the House bill, attaching the Bureau to the Treasury Department. This bill passed, but too late for action in the House. The debate wandered over the whole policy of the administration and the general question of slavery, without touching very closely the specific merits of the measure in hand.

Meantime the election took place, and the administration, returning from the country with a vote of renewed confidence, addressed itself to the matter more seriously. A conference between the houses agreed upon a carefully drawn measure which contained the chief provisions of Charles Sumner's bill, but made the proposed organization a department independent of both the War and Treasury officials. The bill was conservative, giving the new department "general superintendence of all freedmen." It was to "establish regulations" for them, protect them, lease them lands, adjust their wages, and appear in civil and military courts as their "next friend." There were many limitations attached to the powers thus granted, and the organization was made permanent. Nevertheless, the Senate defeated the bill, and a new conference committee was appointed. This committee reported a new bill, February 28, which was whirled through just as the session closed, and which became the act of 1865 establishing in the War Department a "Bureau of Refugees, Freedmen, and Abandoned Lands."

This last compromise was a hasty bit of legislation, vague and uncertain in outline. A Bureau was created, "to continue during the present War of Rebellion, and for one year thereafter," to which was given "the supervision and management of all abandoned lands, and the control of all subjects relating to refugees and freedmen," under "such rules and regulations as may be presented by the head of the Bureau and approved by the President." A commissioner, appointed by the President and Senate, was to control the Bureau, with an office force not exceeding ten clerks. The President might also appoint commissioners in the seceded states, and to all these offices military officials might be detailed at regular pay. The Secretary of War could issue rations, clothing, and fuel to the destitute, and all abandoned property was placed in the hands of the Bureau for eventual lease and sale to ex-slaves in forty-acre parcels.

Thus did the United States government definitely assume charge of the emancipated Negro as the ward of the nation. It was a tremendous undertaking. Here, at a stroke of the pen, was erected a government of millions of men,--and not ordinary men, either, but black men emasculated by a peculiarly complete system of slavery, centuries old; and now, suddenly, violently, they come into a new birthright, at a time of war and passion, in the midst of the stricken, embittered population of their former masters. Any man might well have hesitated to assume charge of such a work, with vast responsibilities, indefinite powers, and limited resources. Probably no one but a soldier would have answered such a call promptly; and indeed no one but a soldier could be called, for Congress had appropriated no money for salaries and expenses.

Less than a month after the weary emancipator passed to his rest, his successor assigned Major General Oliver O. Howard to duty as commissioner of the new Bureau. He was a Maine man, then only thirty-five years of age. He had marched with Sherman to the sea, had fought well at Gettysburg, and had but a year before been assigned to the command of the Department of Tennessee. An honest and sincere men, with rather too much faith in human nature, little aptitude for systematic business and intricate detail, he was nevertheless conservative, hard-working, and, above all, acquainted at first-hand with much of the work before him. And of that work it has been truly said, "No approximately correct history of civilization can ever be written which does not throw out in bold relief, as one of the great landmarks of political and social progress, the organization and administration of the Freedmen's

Bureau."

On May 12, 1865, Howard was appointed, and he assumed the duties of his office promptly on the 15th, and began examining the field of work. A curious mess he looked upon: little despotisms, communistic experiments, slavery, peonage, business speculations, organized charity, unorganized almsgiving,--all reeling on under the guise of helping the freedman, and all enshrined in the smoke and blood of war and the cursing and silence of angry men. On May 19 the new government--for a government it really was--issued its constitution; commissioners were to be appointed in each of the seceded states, who were to take charge of "all subjects relating to refugees and freedmen," and all relief and rations were to be given by their consent alone. The Bureau invited continued cooperation with benevolent societies, and declared, "It will be the object of all commissioners to introduce practicable systems of compensated labor," and to establish schools. Forthwith nine assistant commissioners were appointed. They were to hasten to their fields of work; seek gradually to close relief establishments, and make the destitute self-supporting; act as courts of law where there were no courts, or where Negroes were not recognized in them as free; establish the institution of marriage among ex-slaves, and keep records; see that freedmen were free to choose their employers, and help in making fair contracts for them; and finally, the circular said, "Simple good faith, for which we hope on all hands for those concerned in the passing away of slavery, will especially relieve the assistant commissioners in the discharge of their duties toward the freedmen, as well as promote the general welfare."

No sooner was the work thus started, and the general system and local organization in some measure begun, than two grave difficulties appeared which changed largely the theory and outcome of Bureau work. First, there were the abandoned lands of the South. It had long been the more or less definitely expressed theory of the North that all the chief problems of emancipation might be settled by establishing the slaves on the forfeited lands of their masters,--a sort of poetic justice, said some. But this poetry done into solemn prose meant either wholesale confiscation of private property in the South, or vast appropriations. Now Congress had not appropriated a cent, and no sooner did the proclamations of general amnesty appear than the 800,000 acres of abandoned lands in the hands of the Freedmen's Bureau melted quickly away. The second difficulty lay in perfecting the local organization of the Bureau throughout the wide field of work. Making a new machine and sending out officials of duly ascertained fitness for a great work of social reform is no child's task; but this task was even harder, for a new central organization had to be fitted on a heterogeneous and confused but already existing system of relief and control of ex-slaves; and the agents available for this work must be sought for in an army still busy with war operations,--men in the very nature of the case ill fitted for delicate social work,--or among the questionable camp followers of an invading host. Thus, after a year's work, vigorously as it was pushed, the problem looked even more difficult to grasp and solve than at the beginning. Nevertheless, three things that year's work did, well worth the doing: it relieved a vast amount of physical suffering; it transported 7000 fugitives from congested centres back to the farm; and, best of all, it inaugurated the crusade of the New England schoolma'am.

The annals of this Ninth Crusade are yet to be written, the tale of a mission that seemed to our age far more quixotic than the quest of St. Louis seemed to his. Behind the mists of ruin and rapine waved the calico dresses of women who dared, and after the hoarse mouthings of the field guns rang the rhythm of the alphabet. Rich and poor they were, serious and curious. Bereaved now of a father, now of a brother, now of more than these, they came seeking a life work in planting New England schoolhouses among the white and black of the South. They did their work well. In that first year they taught 100,000 souls, and more.

Evidently, Congress must soon legislate again on the hastily organized Bureau, which had so quickly grown into wide significance and vast possibilities. An institution such as that was well-nigh as difficult to end as to begin. Early in 1866 Congress took up the matter, when Senator Trumbull, of Illinois, introduced a bill to extend the Bureau and enlarge its powers. This measure received, at the hands of Congress, far more thorough discussion and attention than its predecessor. The war cloud had thinned enough to allow a clearer conception of the work of emancipation. The champions of the bill argued that the strengthening of the Freedmen's Bureau was still a military necessity; that it was needed for the proper carrying out of the Thirteenth Amendment, and was a work of sheer justice to the ex-slave, at a trifling cost to the government. The opponents of the measure declared that the war was over, and the necessity for war measures past; that the Bureau, by reason of its extraordinary powers, was clearly unconstitutional in time of peace, and was destined to irritate the South and pauperize the freedmen, at a final cost of possibly hundreds of millions. Two of these arguments were unanswered, and indeed unanswerable: the one that the extraordinary powers of the Bureau threatened the civil rights of all citizens; and the other that the government must have power to do what manifestly must be done, and that present abandonment of the freedmen meant their practical enslavement. The bill which finally passed enlarged and made permanent the Freedmen's Bureau. It was promptly vetoed by President Johnson, as "unconstitutional," "unnecessary," and "extrajudicial," and failed of passage over the veto. Meantime, however, the breach between Congress and the President began to

broaden, and a modified form of the lost bill was finally passed over the President's second veto, July 16.

The act of 1866 gave the Freedmen's Bureau its final form,--the form by which it will be known to posterity and judged of men. It extended the existence of the Bureau to July, 1868; it authorized additional assistant commissioners, the retention of army officers mustered out of regular service, the sale of certain forfeited lands to freedmen on nominal terms, the sale of Confederate public property for Negro schools, and a wider field of judicial interpretation and cognizance. The government of the un-reconstructed South was thus put very largely in the hands of the Freedmen's Bureau, especially as in many cases the departmental military commander was now made also assistant commissioner. It was thus that the Freedmen's Bureau became a full-fledged government of men. It made laws, executed them and interpreted them; it laid and collected taxes, defined and punished crime, maintained and used military force, and dictated such measures as it thought necessary and proper for the accomplishment of its varied ends. Naturally, all these powers were not exercised continuously nor to their fullest extent; and yet, as General Howard has said, "scarcely any subject that has to be legislated upon in civil society failed, at one time or another, to demand the action of this singular Bureau."

To understand and criticise intelligently so vast a work, one must not forget an instant the drift of things in the later sixties: Lee had surrendered, Lincoln was dead, and Johnson and Congress were at loggerheads; the Thirteenth Amendment was adopted, the Fourteenth pending, and the Fifteenth declared in force in 1870. Guerrilla raiding, the ever present flickering after-flame of war, was spending its force against the Negroes, and all the Southern land was awakening as from some wild dream to poverty and social revolution. In a time of perfect calm, amid willing neighbors and streaming wealth, the social uplifting of 4,000,000 slaves to an assured and self-sustaining place in the body politic and economic would have been an herculean task; but when to the inherent difficulties of so delicate and nice a social operation were added the spite and hate of conflict, the Hell of War; when suspicion and cruelty were rife, and gaunt Hunger wept beside Bereavement,--in such a case, the work of any instrument of social regeneration was in large part foredoomed to failure. The very name of the Bureau stood for a thing in the South which for two centuries and better men had refused even to argue,--that life amid free Negroes was simply unthinkable, the maddest of experiments. The agents which the Bureau could command varied all the way from unselfish philanthropists to narrow-minded busybodies and thieves; and even though it be true that the average was far better than the worst, it was the one fly that helped to spoil the ointment. Then, amid all this crouched the freed slave, bewildered between friend and foe. He had emerged from slavery: not the worst slavery in the world, not a slavery that made all life unbearable,--rather, a slavery that had here and there much of kindliness, fidelity, and happiness,--but withal slavery, which, so far as human aspiration and desert were concerned, classed the black man and the ox together. And the Negro knew full well that, whatever their deeper convictions may have been, Southern men had fought with desperate energy to perpetuate this slavery, under which the black masses, with half-articulate thought, had writhed and shivered. They welcomed freedom with a cry. They fled to the friends that had freed them. They shrank from the master who still strove for their chains. So the cleft between the white and black South grew. Idle to say it never should have been; it was as inevitable as its results were pitiable. Curiously incongruous elements were left arrayed against each other: the North, the government, the carpetbagger, and the slave, here; and there, all the South that was white, whether gentleman or vagabond, honest man or rascal, lawless murderer or martyr to duty.

Thus it is doubly difficult to write of this period calmly, so intense was the feeling, so mighty the human passions, that swayed and blinded men. Amid it all two figures ever stand to typify that day to coming men: the one a gray-haired gentleman, whose fathers had quit themselves like men, whose sons lay in nameless graves, who bowed to the evil of slavery because its abolition boded untold ill to all; who stood at last, in the evening of life, a blighted, ruined form, with hate in his eyes. And the other, a form hovering dark and mother-like, her awful face black with the mists of centuries, had aforetime bent in love over her white master's cradle, rocked his sons and daughters to sleep, and closed in death the sunken eyes of his wife to the world; ay, too, had laid herself low to his lust and borne a tawny man child to the world, only to see her dark boy's limbs scattered to the winds by midnight marauders riding after Damned Niggers. These were the saddest sights of that woeful day; and no man clasped the hands of these two passing figures of the present-past; but hating they went to their long home, and hating their children's children live to-day.

Here, then, was the field of work for the Freedmen's Bureau; and since, with some hesitation, it was continued by the act of 1868 till 1869, let us look upon four years of its work as a whole. There were, in 1868, 900 Bureau officials scattered from Washington to Texas, ruling, directly and indirectly, many millions of men. And the deeds of these rulers fall mainly under seven heads,--the relief of physical suffering, the overseeing of the beginnings of free labor, the buying and selling of land, the establishment of schools, the paying of bounties, the administration of justice, and the financiering of all these activities. Up to June, 1869, over half a million patients had been treated by Bureau physicians and surgeons, and sixty hospitals and asylums had been in operation. In fifty

months of work 21,000,000 free rations were distributed at a cost of over $4,000,000,--beginning at the rate of 30,000 rations a day in 1865, and discontinuing in 1869. Next came the difficult question of labor. First, 30,000 black men were transported from the refuges and relief stations back to the farms, back to the critical trial of a new way of working. Plain, simple instructions went out from Washington,--the freedom of laborers to choose employers, no fixed rates of wages, no peonage or forced labor. So far so good; but where local agents differed toto coelo in capacity and character, where the personnel was continually changing, the outcome was varied. The largest element of success lay in the fact that the majority of the freedmen were willing, often eager, to work. So contracts were written,--50,000 in a single state,--laborers advised, wages guaranteed, and employers supplied. In truth, the organization became a vast labor bureau; not perfect, indeed,--notably defective here and there,--but on the whole, considering the situation, successful beyond the dreams of thoughtful men. The two great obstacles which confronted the officers at every turn were the tyrant and the idler: the slaveholder, who believed slavery was right, and was determined to perpetuate it under another name; and the freedman, who regarded freedom as perpetual rest. These were the Devil and the Deep Sea.

In the work of establishing the Negroes as peasant proprietors the Bureau was severely handicapped, as I have shown. Nevertheless, something was done. Abandoned lands were leased so long as they remained in the hands of the Bureau, and a total revenue of $400,000 derived from black tenants. Some other lands to which the nation had gained title were sold, and public lands were opened for the settlement of the few blacks who had tools and capital. The vision of landowning, however, the righteous and reasonable ambition for forty acres and a mule which filled the freedmen's dreams, was doomed in most cases to disappointment. And those men of marvelous hind-sight, who to-day are seeking to preach the Negro back to the soil, know well, or ought to know, that it was here, in 1865, that the finest opportunity of binding the black peasant to the soil was lost. Yet, with help and striving, the Negro gained some land, and by 1874, in the one state of Georgia, owned near 350,000 acres.

The greatest success of the Freedmen's Bureau lay in the planting of the free school among Negroes, and the idea of free elementary education among all classes in the South. It not only called the schoolmistress through the benevolent agencies, and built them schoolhouses, but it helped discover and support such apostles of human development as Edmund Ware, Erastus Cravath, and Samuel Armstrong. State superintendents of education were appointed, and by 1870 150,000 children were in school. The opposition to Negro education was bitter in the South, for the South believed an educated Negro to be a dangerous Negro. And the South was not wholly wrong; for education among all kinds of men always has had, and always will have, an element of danger and revolution, of dissatisfaction and discontent. Nevertheless, men strive to know. It was some inkling of this paradox, even in the unquiet days of the Bureau, that allayed an opposition to human training, which still to-day lies smouldering, but not flaming. Fisk, Atlanta, Howard, and Hampton were founded in these days, and nearly $6,000,000 was expended in five years for educational work, $750,000 of which came from the freedmen themselves.

Such contributions, together with the buying of land and various other enterprises, showed that the ex-slave was handling some free capital already. The chief initial source of this was labor in the army, and his pay and bounty as a soldier. Payments to Negro soldiers were at first complicated by the ignorance of the recipients, and the fact that the quotas of colored regiments from Northern states were largely filled by recruits from the South, unknown to their fellow soldiers. Consequently, payments were accompanied by such frauds that Congress, by joint resolution in 1867, put the whole matter in the hands of the Freedmen's Bureau. In two years $6,000,000 was thus distributed to 5000 claimants, and in the end the sum exceeded $8,000,000. Even in this system, fraud was frequent; but still the work put needed capital in the hands of practical paupers, and some, at least, was well spent.

The most perplexing and least successful part of the Bureau's work lay in the exercise of its judicial functions. In a distracted land where slavery had hardly fallen, to keep the strong from wanton abuse of the weak, and the weak from gloating insolently over the half-shorn strength of the strong, was a thankless, hopeless task. The former masters of the land were peremptorily ordered about, seized and imprisoned, and punished over and again, with scant courtesy from army officers. The former slaves were intimidated, beaten, raped, and butchered by angry and revengeful men. Bureau courts tended to become centres simply for punishing whites, while the regular civil courts tended to become solely institutions for perpetuating the slavery of blacks. Almost every law and method ingenuity could devise was employed by the legislatures to reduce the Negroes to serfdom,--to make them the slaves of the state, if not of individual owners; while the Bureau officials too often were found striving to put the "bottom rail on top," and give the freedmen a power and independence which they could not yet use. It is all well enough for us of another generation to wax wise with advice to those who bore the burden in the heat of the day. It is full easy now to see that the man who lost home, fortune, and family at a stroke, and saw his land ruled by "mules and niggers," was really benefited by the passing of slavery. It is not difficult now to say to the young freedman, cheated and cuffed about, who has seen his father's head beaten to a jelly and his own mother namelessly assaulted, that the meek shall inherit the earth. Above all, nothing is more convenient than to heap on the Freedmen's

Bureau all the evils of that evil day, and damn it utterly for every mistake and blunder that was made.

All this is easy, but it is neither sensible nor just. Some one had blundered, but that was long before Oliver Howard was born; there was criminal aggression and heedless neglect, but without some system of control there would have been far more than there was. Had that control been from within, the Negro would have been reenslaved, to all intents and purposes. Coming as the control did from without, perfect men and methods would have bettered all things; and even with imperfect agents and questionable methods, the work accomplished was not undeserving of much commendation. The regular Bureau court consisted of one representative of the employer, one of the Negro, and one of the Bureau. If the Bureau could have maintained a perfectly judicial attitude, this arrangement would have been ideal, and must in time have gained confidence; but the nature of its other activities and the character of its personnel prejudiced the Bureau in favor of the black litigants, and led without doubt to much injustice and annoyance. On the other hand, to leave the Negro in the hands of Southern courts was impossible.

What the Freedmen's Bureau cost the nation is difficult to determine accurately. Its methods of bookkeeping were not good, and the whole system of its work and records partook of the hurry and turmoil of the time. General Howard himself disbursed some $15,000,000 during his incumbency; but this includes the bounties paid colored soldiers, which perhaps should not be counted as an expense of the Bureau. In bounties, prize money, and all other expenses, the Bureau disbursed over $20,000,000 before all of its departments were finally closed. To this ought to be added the large expenses of the various departments of Negro affairs before 1865; but these are hardly extricable from war expenditures, nor can we estimate with any accuracy the contributions of benevolent societies during all these years.

Such was the work of the Freedmen's Bureau. To sum it up in brief, we may say: it set going a system of free labor; it established the black peasant proprietor; it secured the recognition of black freemen before courts of law; it founded the free public school in the South. On the other hand, it failed to establish good will between ex-masters and freedmen; to guard its work wholly from paternalistic methods that discouraged self-reliance; to make Negroes landholders in any considerable numbers. Its successes were the result of hard work, supplemented by the aid of philanthropists and the eager striving of black men. Its failures were the result of bad local agents, inherent difficulties of the work, and national neglect. The Freedmen's Bureau expired by limitation in 1869, save its educational and bounty departments. The educational work came to an end in 1872, and General Howard's connection with the Bureau ceased at that time. The work of paying bounties was transferred to the adjutant general's office, where it was continued three or four years longer.

Such an institution, from its wide powers, great responsibilities, large control of moneys, and generally conspicuous position, was naturally open to repeated and bitter attacks. It sustained a searching congressional investigation at the instance of Fernando Wood in 1870. It was, with blunt discourtesy, transferred from Howard's control, in his absence, to the supervision of Secretary of War Belknap in 1872, on the Secretary's recommendation. Finally, in consequence of grave intimations of wrongdoing made by the Secretary and his subordinates, General Howard was court-martialed in 1874. In each of these trials, and in other attacks, the commissioner of the Freedmen's Bureau was exonerated from any willful misdoing, and his work heartily commended. Nevertheless, many unpleasant things were brought to light: the methods of transacting the business of the Bureau were faulty; several cases of defalcation among officials in the field were proven, and further frauds hinted at; there were some business transactions which savored of dangerous speculation, if not dishonesty; and, above all, the smirch of the Freedmen's Bank, which, while legally distinct from, was morally and practically a part of the Bureau, will ever blacken the record of this great institution. Not even ten additional years of slavery could have done as much to throttle the thrift of the freedmen as the mismanagement and bankruptcy of the savings bank chartered by the nation for their especial aid. Yet it is but fair to say that the perfect honesty of purpose and unselfish devotion of General Howard have passed untarnished through the fire of criticism. Not so with all his subordinates, although in the case of the great majority of these there were shown bravery and devotion to duty, even though sometimes linked to narrowness and incompetency.

The most bitter attacks on the Freedmen's Bureau were aimed not so much at its conduct or policy under the law as at the necessity for any such organization at all. Such attacks came naturally from the border states and the South, and they were summed up by Senator Davis, of Kentucky, when he moved to entitle the act of 1866 a bill "to promote strife and conflict between the white and black races... by a grant of unconstitutional power." The argument was of tremendous strength, but its very strength was its weakness. For, argued the plain common sense of the nation, if it is unconstitutional, unpracticable, and futile for the nation to stand guardian over its helpless wards, then there is left but one alternative: to make those wards their own guardians by arming them with the ballot. The alternative offered the nation then was not between full and restricted Negro suffrage; else every sensible

man, black and white, would easily have chosen the latter. It was rather a choice between suffrage and slavery, after endless blood and gold had flowed to sweep human bondage away. Not a single Southern legislature stood ready to admit a Negro, under any conditions, to the polls; not a single Southern legislature believed free Negro labor was possible without a system of restrictions that took all its freedom away; there was scarcely a white man in the South who did not honestly regard emancipation as a crime, and its practical nullification as a duty. In such a situation, the granting of the ballot to the black man was a necessity, the very least a guilty nation could grant a wronged race. Had the opposition to government guardianship of Negroes been less bitter, and the attachment to the slave system less strong, the social seer can well imagine a far better policy: a permanent Freedmen's Bureau, with a national system of Negro schools; a carefully supervised employment and labor office; a system of impartial protection before the regular courts; and such institutions for social betterment as savings banks, land and building associations, and social settlements. All this vast expenditure of money and brains might have formed a great school of prospective citizenship, and solved in a way we have not yet solved the most perplexing and persistent of the Negro problems.

That such an institution was unthinkable in 1870 was due in part to certain acts of the Freedmen's Bureau itself. It came to regard its work as merely temporary, and Negro suffrage as a final answer to all present perplexities. The political ambition of many of its agents and proteges led it far afield into questionable activities, until the South, nursing its own deep prejudices, came easily to ignore all the good deeds of the Bureau, and hate its very name with perfect hatred. So the Freedmen's Bureau died, and its child was the Fifteenth Amendment.

The passing of a great human institution before its work is done, like the untimely passing of a single soul, but leaves a legacy of striving for other men. The legacy of the Freedmen's Bureau is the heavy heritage of this generation. Today, when new and vaster problems are destined to strain every fibre of the national mind and soul, would it not be well to count this legacy honestly and carefully? For this much all men know: despite compromise, struggle, war, and struggle, the Negro is not free. In the backwoods of the Gulf states, for miles and miles, he may not leave the plantation of his birth; in well-nigh the whole rural South the black farmers are peons, bound by law and custom to an economic slavery, from which the only escape is death or the penitentiary. In the most cultured sections and cities of the South the Negroes are a segregated servile caste, with restricted rights and privileges. Before the courts, both in law and custom, they stand on a different and peculiar basis. Taxation without representation is the rule of their political life. And the result of all this is, and in nature must have been, lawlessness and crime. That is the large legacy of the Freedmen's Bureau, the work it did not do because it could not.

I have seen a land right merry with the sun; where children sing, and rolling hills lie like passioned women, wanton with harvest. And there in the King's Highway sat and sits a figure, veiled and bowed, by which the traveler's footsteps hasten as they go. On the tainted air broods fear. Three centuries' thought has been the raising and unveiling of that bowed human heart, and now, behold, my fellows, a century new for the duty and the deed. The problem of the twentieth century is the problem of the color line.

OF THE TRAINING OF BLACK MEN by W. E. Burghardt Du Bois

From the shimmering swirl of waters where many, many thoughts ago the slave-ship first saw the square tower of Jamestown have flowed down to our day three streams of thinking: one from the larger world here and over-seas, saying, the multiplying of human wants in culture lands calls for the world-wide co-operation of men in satisfying them. Hence arises a new human unity, pulling the ends of earth nearer, and all men, black, yellow, and white. The larger humanity strives to feel in this contact of living nations and sleeping hordes a thrill of new life in the world, crying, If the contact of Life and Sleep be Death, shame on such Life. To be sure, behind this thought lurks the afterthought of force and dominion,--the making of brown men to delve when the temptation of beads and red calico cloys.

The second thought streaming from the death-ship and the curving river is the thought of the older South: the sincere and passionate belief that somewhere between men and cattle God created a tertium quid, and called it a Negro,--a clownish, simple creature, at times even lovable within its limitations, but straitly foreordained to walk within the Veil. To be sure, behind the thought lurks the afterthought,--some of them with favoring chance might become men, but in sheer self-defense we dare not let them, and build about them walls so high, and hang between them and the light a veil so thick, that they shall not even think of breaking through.

And last of all there trickles down that third and darker thought, the thought of the things themselves, the confused half-conscious mutter of men who are black and whitened, crying Liberty, Freedom, Opportunity--vouchsafe to us, O boastful World, the chance of living men! To be sure, behind the thought lurks the afterthought: suppose, after all, the World is right and we are less than men?

Suppose this mad impulse within is all wrong, some mock mirage from the untrue?

So here we stand among thoughts of human unity, even through conquest and slavery; the inferiority of black men, even if forced by fraud; a shriek in the night for the freedom of men who themselves are not yet sure of their right to demand it. This is the tangle of thought and afterthought wherein we are called to solve the problem of training men for life.

Behind all its curiousness, so attractive alike to sage and dilettante, lie its dim dangers, throwing across us shadows at once grotesque and awful. Plain it is to us that what the world seeks through desert and wild we have within our threshold;--a stalwart laboring force, suited to the semi-tropics; if, deaf to the voice of the Zeitgeist, we refuse to use and develop these men, we risk poverty and loss. If, on the other hand, seized by the brutal afterthought, we debauch the race thus caught in our talons, selfishly sucking their blood and brains in the future as in the past, what shall save us from national decadence? Only that saner selfishness which, Education teaches men, can find the rights of all in the whirl of work.

Again, we may decry the color prejudice of the South, yet it remains a heavy fact. Such curious kinks of the human mind exist and must be reckoned with soberly. They cannot be laughed away, nor always successfully stormed at, nor easily abolished by act of legislature. And yet they cannot be encouraged by being let alone. They must be recognized as facts, but unpleasant facts; things that stand in the way of civilization and religion and common decency. They can be met in but one way: by the breadth and broadening of human reason, by catholicity of taste and culture. And so, too, the native ambition and aspiration of men, even though they be black, backward, and ungraceful, must not lightly be dealt with. To stimulate wildly weak and untrained minds is to play with mighty fires; to flout their striving idly is to welcome a harvest of brutish crime and shameless lethargy in our very laps. The guiding of thought and the deft coordination of deed is at once the path of honor and humanity.

And so, in this great question of reconciling three vast and partially contradictory streams of thought, the one panacea of Education leaps to the lips of all; such human training as will best use the labor of all men without enslaving or brutalizing; such training as will give us poise to encourage the prejudices that bulwark society, and stamp out those that in sheer barbarity deafen us to the wail of prisoned souls within the Veil, and the mounting fury of shackled men.

But when we have vaguely said Education will set this tangle straight, what have we uttered but a truism? Training for life teaches living; but what training for the profitable living together of black men and white? Two hundred years ago our task would have seemed easier. Then Dr. Johnson blandly assured us that education was needed solely for the embellishments of life, and was useless for ordinary vermin. To-day we have climbed to heights where we would open at least the outer courts of knowledge to all, display its treasures to many, and select the few to whom its mystery of Truth is revealed, not wholly by truth or the accidents of the stock market, but at least in part according to deftness and aim, talent and character. This programme, however, we are sorely puzzled in carrying out through that part of the land where the blight of slavery fell hardest, and where we are dealing with two backward peoples. To make here in human education that ever necessary combination of the permanent and the contingent--of the ideal and the practical in workable equilibrium--has been there, as it ever must be in every age and place, a matter of infinite experiment and frequent mistakes.

In rough approximation we may point out four varying decades of work in Southern education since the Civil War. From the close of the war until 1876 was the period of uncertain groping and temporary relief. There were army schools, mission schools, and schools of the Freedmen's Bureau in chaotic disarrangement, seeking system and cooperation. Then followed ten years of constructive definite effort toward the building of complete school systems in the South. Normal schools and colleges were founded for the freedmen, and teachers trained there to man the public schools. There was the inevitable tendency of war to underestimate the prejudice of the master and the ignorance of the slave, and all seemed clear sailing out of the wreckage of the storm. Meantime, starting in this decade yet especially developing from 1885 to 1895, began the industrial revolution of the South. The land saw glimpses of a new destiny and the stirring of new ideals. The educational system striving to complete itself saw new obstacles and a field of work ever broader and deeper. The Negro colleges, hurriedly founded, were inadequately equipped, illogically distributed, and of varying efficiency and grade; the normal and high schools were doing little more than common school work, and the common schools were training but a third of the children who ought to be in them, and training these too often poorly. At the same time the white South, by reason of its sudden conversion from the slavery ideal, by so much the more became set and strengthened in its racial prejudice, and crystallized it into harsh law and harsher custom; while the marvelous pushing forward of the poor white daily threatened to take even bread and butter from the mouths of the heavily handicapped sons of the freedmen. In the midst, then, of the larger problem of Negro education sprang up the more practical question of work, the inevitable economic quandary that faces a people in the transition from slavery to freedom, and especially those who make that change amid hate and

prejudice, lawlessness and ruthless competition.

The industrial school springing to notice in this decade, but coming to full recognition in the decade beginning with 1895, was the proffered answer to this combined educational and economic crisis, and an answer of singular wisdom and timeliness. From the very first in nearly all the schools some attention had been given to training in handiwork, but now was this training first raised to a dignity that brought it in direct touch with the South's magnificent industrial development, and given an emphasis which reminded black folk that before the Temple of Knowledge swing the Gates of Toil.

Yet after all they are but gates, and when turning our eyes from the temporary and the contingent in the Negro problem to the broader question of the permanent uplifting and civilization of black men in America, we have a right to inquire, as this enthusiasm for material advancement mounts to its height, if after all the industrial school is the final and sufficient answer in the training of the Negro race; and to ask gently, but in all sincerity, the ever recurring query of the ages, Is not life more than meat, and the body more than raiment? And men ask this to-day all the more eagerly because of sinister signs in recent educational movements. The tendency is here born of slavery and quickened to renewed life by the crazy imperialism of the day, to regard human beings as among the material resources of a land to be trained with an eye single to future dividends. Race prejudices, which keep brown and black men in their "places," we are coming to regard as useful allies with such a theory, no matter how much they may dull the ambition and sicken the hearts of struggling human beings. And above all, we daily hear that an education that encourages aspiration, that sets the loftiest of ideals and seeks as an end culture and character than bread-winning, is the privilege of white men and the danger and delusion of black.

Especially has criticism been directed against the former educational efforts to aid the Negro. In the four periods I have mentioned, we find first boundless, planless enthusiasm and sacrifice; then the preparation of teachers for a vast public school system; then the launching and expansion of that school system amid increasing difficulties; and finally the training of workmen for the new and growing industries. This development has been sharply ridiculed as a logical anomaly and flat reversal of nature. Soothly we have been told that first industrial and manual training should have taught the Negro to work, then simple schools should have taught him to read and write, and finally, after years, high and normal schools could have completed the system, as intelligence and wealth demanded.

That a system logically so complete was historically impossible, it needs but a little thought to prove. Progress in human affairs is more often a pull than a push, surging forward of the exceptional man, and the lifting of his duller brethren slowly and painfully to his vantage ground. Thus it was no accident that gave birth to universities centuries before the common schools, that made fair Harvard the first flower of our wilderness. So in the South: the mass of the freedmen at the end of the war lacked the intelligence so necessary to modern workingmen. They must first have the common school to teach them to read, write, and cipher. The white teachers who flocked South went to establish such a common school system. They had no idea of founding colleges; they themselves at first would have laughed at the idea. But they faced, as all men since them have faced, that central paradox of the South, the social separation of the races. Then it was the sudden volcanic rupture of nearly all relations between black and white, in work and government and family life. Since then a new adjustment of relations in economic and political affairs has grown up,--an adjustment subtle and difficult to grasp, yet singularly ingenious, which leaves still that frightful chasm at the color line across which men pass at their peril. Thus, then and now, there stand in the South two separate worlds; and separate not simply in the higher realms of social intercourse, but also in church and school, on railway and street car, in hotels and theatres, in streets and city sections, in books and newspapers, in asylums and jails, in hospitals and graveyards. There is still enough of contact for large economic and group cooperation, but the separation is so thorough and deep, that it absolutely precludes for the present between the races anything like that sympathetic and effective group training and leadership of the one by the other, such as the American Negro and all backward peoples must have for effectual progress.

This the missionaries of '68 soon saw; and if effective industrial and trade schools were impractical before the establishment of a common school system, just as certainly no adequate common schools could be founded until there were teachers to teach them. Southern whites would not teach them; Northern whites in sufficient numbers could not be had. If the Negro was to learn, he must teach himself, and the most effective help that could be given him was the establishment of schools to train Negro teachers. This conclusion was slowly but surely reached by every student of the situation until simultaneously, in widely separated regions, without consultation or systematic plan, there arose a series of institutions designed to furnish teachers for the untaught. Above the sneers of critics at the obvious defects of this procedure must ever stand its one crushing rejoinder: in a single generation they put thirty thousand black teachers in the South; they wiped out the illiteracy of the majority of the black people of the land, and they made Tuskegee possible.

Such higher training schools tended naturally to deepen broader development: at first they were common and grammar schools, then some became high schools. And finally, by 1900, some thirty-four had one year or more of studies of college grade. This development was reached with different degrees of speed in different institutions: Hampton is still a high school, while Fisk University started her college in 1871, and Spelman Seminary about 1896. In all cases the aim was identical: to maintain the standards of the lower training by giving teachers and leaders the best practicable training; and above all to furnish the black world with adequate standards of human culture and lofty ideals of life. It was not enough that the teachers of teachers should be trained in technical normal methods; they must also, so far as possible, be broad-minded, cultured men and women, to scatter civilization among a people whose ignorance was not simply of letters, but of life itself.

It can thus be seen that the work of education in the South began with higher institutions of training, which threw off as their foliage common schools, and later industrial schools, and at the same time strove to shoot their roots ever deeper toward college and university training. That this was an inevitable and necessary development, sooner or later, goes without saying; but there has been, and still is, a question in many minds if the natural growth was not forced, and if the higher training was not either overdone or done with cheap and unsound methods. Among white Southerners this feeling is widespread and positive. A prominent Southern journal voiced this in a recent editorial:

"The experiment that has been made to give the colored students classical training has not been satisfactory. Even though many were able to pursue the course, most of them did so in a parrot-like way, learning what was taught, but not seeming to appropriate the truth and import of their instruction, and graduating without sensible aim or valuable occupation for their future. The whole scheme has proved a waste of time, efforts, and the money of the state."

While most far-minded men would recognize this as extreme and overdrawn, still without doubt many are asking, Are there a sufficient number of Negroes ready for college training to warrant the undertaking? Are not too many students prematurely forced into this work? Does it not have the effect of dissatisfying the young Negro with his environment? And do these graduates succeed in real life? Such natural questions cannot be evaded, nor on the other hand must a nation naturally skeptical as to Negro ability assume an unfavorable answer without careful inquiry and patient openness to conviction. We must not forget that most Americans answer all queries regarding the Negro a priori, and that the least that human courtesy can do is to listen to evidence.

The advocates of the higher education of the Negro would be the last to deny the incompleteness and glaring defects of the present system: too many institutions have attempted to do college work, the work in some cases has not been thoroughly done, and quantity rather than quality has sometimes been sought. But all this can be said of higher education throughout the land: it is the almost inevitable incident of educational growth, and leaves the deeper question of the legitimate demand for the higher training of Negroes untouched. And this latter question can be settled in but one way--by a first-hand study of the facts. If we leave out of view all institutions which have not actually graduated students from a course higher than that of a New England high school, even though they be called colleges; if then we take the thirty-four remaining institutions, we may clear up many misapprehensions by asking searchingly, What kind of institutions are they, what do they teach, and what sort of men do they graduate?

And first we may say that this type of college, including Atlanta, Fisk and Howard, Wilberforce and Lincoln, Biddle, Shaw, and the rest, is peculiar, almost unique. Through the shining trees that whisper before me as I write, I catch glimpses of a boulder of New England granite, covering a grave, which graduates of Atlanta University have placed there:--

"IN GRATEFUL MEMORY OF THEIR FORMER TEACHER AND FRIEND AND OF THE UNSELFISH LIFE HE LIVED, AND THE NOBLE WORK HE WROUGHT; THAT THEY, THEIR CHILDREN, AND THEIR CHIL- DREN'S CHILDREN MIGHT BE BLESSED."

This was the gift of New England to the freed Negro: not alms, but a friend; not cash, but character. It was not and is not money these seething millions want, but love and sympathy, the pulse of hearts beating with red blood; a gift which to-day only their own kindred and race can bring to the masses, but which once saintly souls brought to their favored children in the crusade of the sixties, that finest thing in American history, and one of the few things untainted by sordid greed and cheap vainglory. The teachers in these institutions came not to keep the Negroes in their place, but to raise them out of their places where the filth of slavery had wallowed them. The colleges they founded were social settlements; homes where the best of the sons of the freedmen came in close and sympathetic touch with the best traditions of New England. They lived and ate together, studies and worked, hoped and harkened in the dawning light. In actual formal content their curriculum was doubtless old-fashioned, but in educational power it was supreme, for it was the contact of living souls.

From such schools about two thousand Negroes have gone forth with the bachelor's degree. The number in itself is enough to put at rest the argument that too large a proportion of Negroes are receiving higher training. If the ratio to population of all Negro students throughout the land, in both college and secondary training, be counted, Commissioner Harris assures us "it must be increased to five times its present average" to equal the average of the land.

Fifty years ago the ability of Negro students in any appreciable numbers to master a modern college course would have been difficult to prove. To-day it is proved by the fact that four hundred Negroes, many of whom have been reported as brilliant students, have received the bachelor's degree from Harvard, Yale, Oberlin, and seventy other leading colleges. Here we have, then, nearly twenty-five hundred Negro graduates, of whom the crucial query must be made. How far did their training fit them for life? It is of course extremely difficult to collect satisfactory data on such a point,--difficult to reach the men, to get trustworthy testimony, and to gauge that testimony by any generally acceptable criterion of success. In 1900, the Conference at Atlanta University undertook to study these graduates, and published the results. First they sought to know what these graduates were doing, and succeeded in getting answers from nearly two thirds of the living. The direct testimony was in almost all cases corroborated by the reports of the colleges where they graduated, so that in the main the reports were worthy of credence. Fifty-three per cent of these graduates were teachers,--presidents of institutions, heads of normal schools, principals of city school systems, and the like. Seventeen per cent were clergymen; another seventeen per cent were in the professions, chiefly as physicians. Over six per cent were merchants, farmers, and artisans, and four per cent were in the government civil service. Granting even that a considerable proportion of the third unheard from are unsuccessful, this is a record of usefulness. Personally I know many hundreds of these graduates and have corresponded with more than a thousand; through others I have followed carefully the life-work of scores; I have taught some of them and some of the pupils whom they have taught, lived in homes which they have builded, and looked at life through their eyes. Comparing them as a class with my fellow students in New England and in Europe, I cannot hesitate in saying that nowhere have I met men and women with a broader spirit of helpfulness, with deeper devotion to their life-work, or with more consecrated determination to succeed in the face of bitter difficulties than among Negro college-bred men. They have, to be sure, their proportion of ne'er-do-weels, their pedants and lettered fools, but they have a surprisingly small proportion of them; they have not that culture of manner which we instinctively associate with university men, forgetting that in reality it is the heritage from cultured homes, and that no people a generation removed from slavery can escape a certain unpleasant rawness and gaucherie, despite the best of training.

With all their larger vision and deeper sensibility, these men have usually been conservative, careful leaders. They have seldom been agitators, have withstood the temptation to head the mob, and have worked steadily and faithfully in a thousand communities in the South. As teachers they have given the South a commendable system of city schools and large numbers of private normal schools and academies. Colored college-bred men have worked side by side with white college graduates at Hampton; almost from the beginning the backbone of Tuskegee's teaching force has been formed of graduates from Fisk and Atlanta. And to-day the institute is filled with college graduates, from the energetic wife of the principal down to the teacher of agriculture, including nearly half of the executive council and a majority of the heads of departments. In the professions, college men are slowly but surely leavening the Negro church, are healing and preventing the devastations of disease, and beginning to furnish legal protection for the liberty and property of the toiling masses. All this is needful work. Who would do it if Negroes did not? How could Negroes do it if they were not trained carefully for it? If white people need colleges to furnish teachers, ministers, lawyers, and doctors, do black people need nothing of the sort?

If it be true that there are an appreciable number of Negro youth in the land capable by character and talent to receive that higher training, the end of which is culture, and if the two and a half thousand who have had something of this training in the past have in the main proved themselves useful to their race and generation, the question then comes, What place in the future development of the South might the Negro college and college-bred man to occupy? That the present social separation and acute race sensitiveness must eventually yield to the influences of culture as the South grows civilized is clear. But such transformation calls for singular wisdom and patience. If, while the healing of this vast sore is progressing, the races are to live for many years side by side, united in economic effort, obeying a common government, sensitive to mutual thought and feeling, yet subtly and silently separate in many matters of deeper human intimacy--if this unusual and dangerous development is to progress amid peace and order, mutual respect and growing intelligence, it will call for social surgery at once the delicatest and nicest in modern history. It will demand broad-minded, upright men both white and black, and in its final accomplishment American civilization will triumph. So far as white men are concerned, this fact is to-day being recognized in the South, and a happy renaissance of university education seems imminent. But the very voices that cry Hail! to this good work are, strange to relate, largely silent or antagonistic to the higher education of the Negro.

Strange to relate! for this is certain, no secure civilization can be built in the South with the Negro as an ignorant, turbulent proletariat. Suppose we seek to remedy this by making them laborers and nothing more: they are not fools, they have tasted of the Tree of Life, and they will not cease to think, will not cease attempting to read the riddle of the world. By taking away their best equipped teachers and leaders, by slamming the door of opportunity in the faces of their bolder and brighter minds, will you make them satisfied with their lot? or will you not rather transfer their leading from the hands of men taught to think to the hands of untrained demagogues? We ought not to forget that despite the pressure of poverty, and despite the active discouragement and even ridicule of friends, the demand for higher training steadily increases among Negro youth: there were, in the years from 1875 to 1880, twenty-two Negro graduates from Northern colleges; from 1885 to 1895 there were forty-three, and from 1895 to 1900, nearly 100 graduates. From Southern Negro colleges there were, in the same three periods, 143, 413, and over 500 graduates. Here, then, is the plain thirst for training; by refusing to give this Talented Tenth the key to knowledge can any sane man imagine that they will lightly lay aside their yearning and contentedly become hewers of wood and drawers of water?

No. The dangerously clear logic of the Negro's position will more and more loudly assert itself in that day when increasing wealth and more intricate social organization preclude the South from being, as it so largely is, simply an armed camp for intimidating black folk. Such waste of energy cannot be spared if the South is to catch up with civilization. And as the black third of the land grows in thrift and skill, unless skillfully guided in its larger philosophy, it must more and more brood over the red past and the creeping, crooked present, until it grasps a gospel of revolt and revenge and throws its new-found energies athwart the current of advance. Even to-day the masses of the Negroes see all too clearly the anomalies of their position and the moral crookedness of yours. You may marshal strong indictments against them, but their counter-cries, lacking though they be in formal logic, have burning truths within them which you may not wholly ignore, O Southern Gentlemen! If you deplore their presence here, they ask, Who brought us? When you shriek, Deliver us from the vision of intermarriage, they answer, that legal marriage is infinitely better than systematic concubinage and prostitution. And if in just fury you accuse their vagabonds of violating women, they also in fury quite as just may wail: the rape which your gentlemen have done against helpless black women in defiance of your own laws is written on the foreheads of two millions of mulattoes, and written in ineffaceable blood. And finally, when you fasten crime upon this race as its peculiar trait, they answer that slavery was the arch-crime, and lynching and lawlessness its twin abortion; that color and race are not crimes, and yet they it is which in this land receive most unceasing condemnation, North, East, South, and West.

I will not say such arguments are wholly justified--I will not insist that there is no other side to the shield; but I do say that of the nine millions of Negroes in this nation, there is scarcely one out of the cradle to whom these arguments do not daily present themselves in the guise of terrible truth. I insist that the question of the future is how best to keep these millions from brooding over the wrongs of the past and the difficulties of the present, so that all their energies may be bent toward a cheerful striving and cooperation with their white neighbors toward a larger, juster, and fuller future. That one wise method of doing this lies in the closer knitting of the Negro to the great industrial possibilities of the South is a great truth. And this the common schools and the manual training and trade schools are working to accomplish. But these alone are not enough. The foundations of knowledge in this race, as in others, must be sunk deep in the college and university if we would build a solid, permanent structure. Internal problems of social advance must inevitably come,--problems of work and wages, of families and homes, of morals and the true valuing of the things of life; and all these and other inevitable problems of civilization the Negro must meet and solve largely for himself, by reason of his isolation; and can there be any possible solution other than by study and thought and an appeal to the rich experience of the past? Is there not, with such a group and in such a crisis, infinitely more danger to be apprehended from half-trained minds and shallow thinking than from over-education and over-refinement? Surely we have wit enough to found a Negro college so manned and equipped as to steer successfully between the dilettante and the fool. We shall hardly induce black men to believe that if their bellies be full it matters little about their brains. They already dimly perceive that the paths of peace winding between honest toil and dignified manhood call for the guidance of skilled thinkers, the loving, reverent comradeship between the black lowly and black men emancipated by training and culture.

The function of the Negro college then is clear: it must maintain the standards of popular education, it must seek the social regeneration of the Negro, and it must help in the solution of problems of race contact and cooperation. And finally, beyond all this, it must develop men. Above our modern socialism, and out of the worship of the mass, must persist and evolve that higher individualism which the centres of culture protect; there must come a loftier respect for the sovereign human soul that seeks to know itself and the world about it; that seeks a freedom for expansion and self-development; that will love and hate and labor in its own way, untrammeled alike by old and new. Such souls aforetime have inspired and guided worlds, and if we be not wholly bewitched by our Rhine-gold, they shall again. Herein the longing of black men must have respect: the rich and bitter depth of their

experience, the unknown treasures of their inner life, the strange rendings of nature they have seen, may give the world new points of view and make their loving, living, and doing precious to all human hearts. And to themselves in these the days that try their souls the chance to soar in the dim blue air above the smoke is to their finer spirits boon and guerdon for what they lose on earth by being black.

I sit with Shakespeare and he winces not. Across the color line I move arm in arm with Balzac and Dumas, where smiling men and welcoming women glide in gilded halls. From out the caves of Evening that swing between the strong-limbed earth and the tracery of the stars, I summon Aristotle and Aurelius and what soul I will, and they come all graciously with no scorn nor condescension. So, wed with Truth, I dwell above the Veil. Is this the life you grudge us, O knightly America? Is this the life you long to change into the dull red hideousness of Georgia? Are you so afraid lest peering from this high Pisgah, between Philistine and Amalekite, we sight the Promised Land?

THE FRUITS OF INDUSTRIAL TRAINING by Booker T. Washington

The political, educational, social, and economic evolution through which the South passed during, say, the first fifteen or twenty years after the close of the civil war furnishes one of the most interesting periods that any country has passed through.

A large share of the thought and activity of the white South, of the black South, and of that section of the North especially interested in my race, was directed during the years of the Reconstruction period toward politics, or toward matters bearing upon what were termed civil or social rights. The work of education was rather slow, and covered a large section of the South; still I think I am justified in saying that in the public mind the Negro's relation to politics overshadowed nearly every other interest. The education of the race was conducted quietly, and attracted comparatively little attention, just as is true at the present time. The appointment of one Negro postmaster at a third or fourth rate post office will be given wider publicity through the daily press than the founding of a school, or some important discovery in science.

With reference to the black man's political relation to the state and Federal governments, I think I am safe in saying that for many years after the civil war there were sharp and antagonistic views between the North and the South, as well as between the white South and the black South. At practically every point where there was a political question to be decided in the South the blacks would array themselves on one side and the whites on the other. I remember that very soon after I began teaching school in Alabama an old colored man came to me just prior to an election. He said: "You can read de newspapers and most of us can't, but dar is one thing dat we knows dat you don't, and dat is how to vote down here; and we wants you to vote as we does." He added: "I tell you how we does. We watches de white man; we keeps watching de white man; de nearer it gits to election time de more we watches de white man. We watches him till we finds out which way he gwine to vote. After we finds out which way he gwine to vote, den we votes exactly de other way; den we knows we 's right."

Stories on the other side might be given showing that a certain class of white people, both at the polls and in the Legislatures, voted just as unreasonably in opposing politically what they thought the Negro or the North wanted, no matter how much benefit might ensue from a contrary action. Unfortunately such antagonism did not end with matters political, but in many cases affected the relation of the races in nearly every walk of life. Aside from political strife, there was naturally deep feeling between the North and the South on account of the war. On nearly every question growing out of the war, which was debated in Congress, or in political campaigns, there was the keenest difference and often the deepest feeling. There was almost no question of even a semi-political nature, or having a remote connection with the Negro, upon which there was not sharp and often bitter division between the North and South. It is needless to say that in many cases the Negro was the sufferer. He was being ground between the upper and nether millstones. Even to this day it is well-nigh impossible, largely by reason of the force of habit, in certain states to prevent state and even local campaigns from being centred in some form upon the black man. In states like Mississippi, for example, where the Negro ceased nearly a score of years ago, by operation of law, to be a determining factor in politics, he forms in some way the principal fuel for campaign discussion at nearly every election. The sad feature of this is, that it prevents the presentation before the masses of the people of matters pertaining to local and state improvement, and to great national issues like finance, tariff, or foreign policies. It prevents the masses from receiving the broad and helpful education which every political campaign should furnish, and, what is equally unfortunate, it prevents the youth from seeing and hearing on the platform the great political leaders of the two national parties. During a national campaign few of the great Democratic leaders debate national questions in the South, because it is felt that the old antagonism to the Negro politically will keep the South voting one way. Few of the great Republican leaders appear on Southern platforms, because they feel that nothing will be gained.

One of the saddest instances of this situation that has come within my knowledge occurred some years ago in a certain Southern state where a white friend of mine was making the race for Congress on the Democratic ticket in a district that was overwhelmingly Democratic. I speak of this man as my friend, because there was no personal favor in reason which he would have refused me. He was equally friendly to the race, and was generous in giving for its education, and in helping individuals to buy land. His campaign took him into one of the "white" counties, where there were few colored people, and where the whites were unusually ignorant. I was surprised one morning to read in the daily papers of a bitter attack he had made on the Negro while speaking in this county. The next time I saw him I informed him of my surprise. He replied that he was ashamed of what he had said, and that he did not himself believe much that he had stated, but gave as a reason for his action that he had found himself before an audience which had heard little for thirty years in the way of political discussion that did not bear upon the Negro, and that he therefore knew it was almost impossible to interest them in any other subject.

But this is somewhat aside from my purpose, which is, I repeat, to make plain that in all political matters there was for years after the war no meeting ground of agreement for the two races, or for the North and South. Upon the question of the Negro's civil rights, as embodied in what was called the Civil Rights Bill, there was almost the same sharp line of division between the races, and, in theory at least, between the Northern and Southern whites,--largely because the former were supposed to be giving the blacks social recognition, and encouraging intermingling between the races. The white teachers, who came from the North to work in missionary schools, received for years little recognition or encouragement from the rank and file of their own race. The lines were so sharply drawn that in cities where native Southern white women taught Negro children in the public schools, they would have no dealings with Northern white women who, perhaps, taught Negro children from the same family in a missionary school.

I want to call attention here to a phase of Reconstruction policy which is often overlooked. All now agree that there was much in Reconstruction which was unwise and unfortunate. However we may regard that policy, and much as we may regret mistakes, the fact is too often overlooked that it was during the Reconstruction period that a public school system for the education of all the people of the South was first established in most of the states. Much that was done by those in charge of Reconstruction legislation has been overturned, but the public school system still remains. True, it has been modified and improved, but the system remains, and is every day growing in popularity and strength.

As to the difference of opinion between the North and the South regarding Negro education, I find that many people, especially in the North, have a wrong conception of the attitude of the Southern white people. It is and has been very generally thought that what is termed "higher education" of the Negro has been from the first opposed by the white South. This opinion is far from being correct. I remember that, in 1891, when I began the work of establishing the Tuskegee Institute in Alabama, practically all of the white people who talked to me on the subject took it for granted that instruction in the Greek, Latin, and modern languages would be one of the main features of our curriculum. I heard no one oppose what he thought our course of study was to embrace. In fact, there are many white people in the South at the present time who do not know that instruction in the dead languages is not given at the Tuskegee Institute. In further proof of what I have stated, if one will go through the catalogue of the schools maintained by the states for Negro people, and managed by Southern white people, he will find in almost every case that instruction in the higher branches is given with the consent and approval of white officials. This was true as far back as 1880. It is not unusual to meet at this time Southern white people who are as emphatic in their belief in the value of classical education as a certain element of colored people themselves. In matters relating to civil and political rights, the breach was broad, and without apparent hope of being bridged; even in the matter of religion, practically all of the denominations had split on the subject of the Negro, though I should add that there is now, and always has been, a closer touch and more cooperation in matters of religion between the white and colored people in the South than is generally known. But the breach between the white churches in the South and North remains.

In matters of education the difference was much less sharp. The truth is that a large element in the South had little faith in the efficacy of the higher or any other kind of education of the Negro. They were indifferent, but did not openly oppose; on the other hand, there has always been a potent element of white people in all of the Southern states who have stood out openly and bravely for the education of all the people, regardless of race. This element has thus far been successful in shaping and leading public opinion, and I think that it will continue to do so more and more. This statement must not be taken to mean that there is as yet an equitable division of the school funds, raised by common taxation, between the two races in many sections of the South, though the Southern states deserve much credit for what has been done. In discussing the small amount of direct taxes the Negro pays, the fact that he pays tremendous indirect taxes is often overlooked.

I wish, however, to emphasize the fact that while there was either open antagonism or indifference in the directions I have named, it was the introduction of industrial training into the Negro's education that seemed to furnish the first basis for anything like united and sympathetic interest and action between the two races in the South and between the whites in the North and those in the South. Aside from its direct benefit to the black race, industrial education has furnished a basis for mutual faith and cooperation, which has meant more to the South, and to the work of education, than has been realized.

This was, at the least, something in the way of construction. Many people, I think, fail to appreciate the difference between the problems now before us and those that existed previous to the civil war. Slavery presented a problem of destruction; freedom presents a problem of construction.

From its first inception the white people of the South had faith in the theory of industrial education, because they had noted, what was not unnatural, that a large element of the colored people at first interpreted freedom to mean freedom from work with the hands. They naturally had not learned to appreciate the fact that they had been WORKED, and that one of the great lessons for freemen to learn is to WORK. They had not learned the vast difference between WORKING and BEING WORKED. The white people saw in the movement to teach the Negro youth the dignity, beauty, and civilizing power of all honorable labor with the hands something that would lead the Negro into his new life of freedom gradually and sensibly, and prevent his going from one extreme of life to the other too suddenly. Furthermore, industrial education appealed directly to the individual and community interest of the white people. They saw at once that intelligence coupled with skill would add wealth to the community and to the state, in which both races would have an added share. Crude labor in the days of slavery, they believed, could be handled and made in a degree profitable, but ignorant and unskilled labor in a state of freedom could not be made so. Practically every white man in the South was interested in agricultural or in mechanical or in some form of manual labor; every white man was interested in all that related to the home life,--the cooking and serving of food, laundering, dairying, poultry-raising, and housekeeping in general. There was no family whose interest in intelligent and skillful nursing was not now and then quickened by the presence of a trained nurse. As already stated, there was general appreciation of the fact that the industrial education of the black people had direct, vital, and practical bearing upon the life of each white family in the South; while there was no such appreciation of the results of mere literary training. If a black man became a lawyer, a doctor, a minister, or an ordinary teacher, his professional duties would not ordinarily bring him in touch with the life of the white portion of the community, but rather confine him almost exclusively to his own race. While purely literary or professional education was not opposed by the white population, it was something in which they found little or no interest, beyond a confused hope that it would result in producing a higher and a better type of Negro manhood. The minute it was seen that through industrial education the Negro youth was not only studying chemistry, but also how to apply the knowledge of chemistry to the enrichment of the soil, or to cooking, or to dairying, and that the student was being taught not only geometry and physics, but their application to blacksmithing, brickmaking, farming, and what not, then there began to appear for the first time a common bond between the two races and cooperation between North and South.

One of the most interesting and valuable instances of the kind that I know of is presented in the case of Mr. George W. Carver, one of our instructors in agriculture at Tuskegee Institute. For some time it has been his custom to prepare articles containing information concerning the conditions of local crops, and warning the farmers against the ravages of certain insects and diseases. The local white papers are always glad to publish these articles, and they are read by white and colored farmers.

Some months ago a white land-holder in Montgomery County asked Mr. Carver to go through his farm with him for the purpose of inspecting it. While doing so Mr. Carver discovered traces of what he thought was a valuable mineral deposit, used in making a certain kind of paint. The interests of the land-owner and the agricultural instructor at once became mutual. Specimens of the deposits were taken to the laboratories of the Tuskegee Institute and analyzed by Mr. Carver. In due time the land-owner received a report of the analysis, together with a statement showing the commercial value and application of the mineral. I shall not go through the whole interesting story, except to say that a stock company, composed of some of the best white people in Alabama, has been organized, and is now preparing to build a factory for the purpose of putting their product on the market. I hardly need to add that Mr. Carver has been freely consulted at every step, and his services generously recognized in the organization of the concern. When the company was being formed the following testimonial, among others, was embodied in the printed copy of the circular:--

"George W. Carver, Director of the Department of Agriculture, Tuskegee, Alabama, says:--

"'The pigment is an ochreous clay. Its value as a paint is due to the presence of ferric oxide, of which it contains more than any of the French, Australian, American, Irish, or Welsh ochres. Ferric oxides have long been recognized as the essential constituents of

such paints as Venetian red, Turkish red, oxide red, Indian red, and scarlet. They are most desirable, being quite permanent when exposed to light and air. As a stain they are most valuable.'"

In further proof of what I wish to emphasize, I think I am safe in saying that the work of the Hampton Normal and Agricultural Institute, under the late General S. C. Armstrong, was the first to receive any kind of recognition and hearty sympathy from the Southern white people, and General Armstrong was perhaps the first Northern educator of Negroes who won the confidence and cooperation of the white South. The effects of General Armstrong's introduction of industrial education at Hampton, and its extension to the Tuskegee Institute in the far South, are now actively and helpfully apparent in the splendid work being accomplished for the whole South by the Southern Education Board, with Mr. Robert C. Ogden at its head, and by the General Education Board, with Mr. William H. Baldwin, Jr., as its president. Without the introduction of manual training it is doubtful whether such work as is now being wrought through these two boards for both races in the South could have been possible within a quarter of a century to come. Later on in the history of our country it will be recognized and appreciated that the far-reaching and statesman-like efforts of these two boards for general education in the South, under the guidance of the two gentlemen named, and with the cooperation and assistance of such men as Mr. George Foster Peabody, Dr. Wallace Buttrick, Mr. John D. Rockefeller, of the North, and Mr. Edgar Gardner Murphy, Chancellor Hill, Dr. Alderman, Dr. McIver, Dr. Dabney, and others of the South, will have furnished the material for one of the brightest and most encouraging chapters in the history of our country. The fact that we have reached the point where men and women who were so far apart twenty years ago can meet in the South and discuss freely from the same platform questions relating to the industrial, educational, political, moral, and religious development of the two races marks a great step in advance. It is true that as yet the Negro has not been invited to share in these discussions.

Aside from the reasons I have given showing why the South favored industrial education, coupled with intellectual and moral training, many of the whites saw, for example, that the Negroes who were master carpenters and contractors, under the guidance of their owners, could become still greater factors in the development of the South if their children were not suddenly removed from the atmosphere and occupations of their fathers, and if they could be taught to use the thing in hand as a foundation for higher growth. Many of the white people were wise enough to see that such education would enable some of the Negro youths to become more skillful carpenters and contractors, and that if they laid an economic foundation in this way in their generation, they would be laying a foundation for a more abstract education of their children in the future.

Again, a large element of people at the South favored manual training for the Negro because they were wise enough to see that the South was largely free from the restrictive influences of the Northern trades unions, and that such organizations would secure little hold in the South so long as the Negro kept abreast in intelligence and skill with the same class of people elsewhere. Many realized that the South would be tying itself to a body of death if it did not help the Negro up. In this connection I want to call attention to the fact that the official records show that within one year about one million foreigners came into the United States. Notwithstanding this number, practically none went into the Southern states; to be more exact, the records show that in 1892 only 2278 all told went into the states of Alabama, Arkansas, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia. One ship sometimes brings as many to New York. Various reasons are given to explain why these foreigners systematically avoid the South. One is that the climate is so hot; and another is that they do not like the restrictions thrown about the ballot; and still another is the presence of the Negro is so large numbers. Whatever the true reason is, the fact remains that foreigners avoid the South, and the South is more and more realizing that it cannot keep pace with the progress being made in other parts of the country if a third of its population is ignorant and without skill.

The South must frankly face this truth, that for a long period it must depend upon the black man to do for it what the foreigner is now doing for the great West. If, by reason of his skill and knowledge, one man in Iowa learns to produce as much corn in a season as four men can produce in Alabama, it requires little reasoning to see that Alabama will buy most of her corn from Iowa.

Another interesting result of the introduction of industrial education for the Negro has been its influence upon the white people of the South, and, I believe, upon the whites of the North as well. This phase of it has proved of interest in making hand training a conciliatory element between the races.

In 1883 I was delivering an address on industrial education before the colored State Teachers' Association of one of our Southern states. When I had finished, some of the teachers began to ask the State Superintendent of Education, who was on the programme, some questions about the subject. He politely but firmly stopped the questions by stating that he knew absolutely nothing about industrial training, and had never heard it discussed before. At that time there was no such education being given at any white institution in that state. With one or two exceptions this case will illustrate what was true of all the Southern states. A

careful investigation of the subject will show that it was not until after industrial education was started among the colored people, and its value proved, that it was taken up by the Southern white people.

Manual training or industrial and technical schools for the whites have, for the most part, been established under state auspices, and are at this time chiefly maintained by the states. An investigation would also show that in securing money from the state legislatures for the purpose of introducing hand work, one of the main arguments used was the existence and success of industrial training among the Negroes. It was often argued that the white boys and girls would be left behind unless they had the opportunities for securing the same kind of training that was being given the colored people. Although it is, I think, not generally known, it is a fact that since the idea of industrial or technical education for white people took root within the last few years, much more money is spent annually for such education for the whites than for the colored people. Any one who has not looked into the subject will be surprised to find how thorough and high grade the work is. Take, for example, the state of Georgia, and it will be found that several times as much is being spent at the Industrial College for white girls at Milledgeville, and at the technical school for whites at Atlanta, as is being spent in the whole state for the industrial education of Negro youths. I have met no Southern white educators who have not been generous in their praise of the Negro schools for taking the initiative in hand training. This fact has again served to create in matters relating to education a bond of sympathy between the two races in the South. Referring again to the influence of industrial training for the Negro in education, in the Northern states I find, while writing this article, the following announcement in the advertisement of what is perhaps the most high-priced and exclusive girls' seminary in Massachusetts:--

"In planning a system of education for young ladies, with the view of fitting them for the greatest usefulness in life, the idea was conceived of supplementing the purely intellectual work by a practical training in the art of home management and its related subjects.

"It was the first school of high literary grade to introduce courses in Domestic Science into the regular curriculum.

"The results were so gratifying as to lead to the equipment of Experiment Hall, a special building, fitted for the purpose of studying the principles of Applied Housekeeping. Here the girls do the actual work of cooking, marketing, arranging menus, and attend to all the affairs of a well-arranged household.

"Courses are arranged also in sewing, dressmaking, and millinery; they are conducted on a similarly practical basis, and equip the student with a thorough knowledge of the subject."

A dozen years ago I do not believe that any such announcement would have been made.

Beginning with the year 1877, the Negro in the South lost practically all political control; that is to say, as early as 1885 the Negro scarcely had any members of his race in the national Congress or state legislatures, and long before this date had ceased to hold state offices. This was true, notwithstanding the protests and fervent oratory of such strong race leaders as Frederick Douglass, B. K. Bruce, John R. Lynch, P. B. S. Pinchback, and John M. Langston, with a host of others. When Frederick Douglass, the greatest man that the race has produced, died in 1895, it is safe to say that the Negro in the Southern states, with here and there a few exceptions, had practically no political control or political influence, except in sending delegates to national conventions, or in holding a few Federal positions by appointment. It became evident to many of the wise Negroes that the race would have to depend for its success in the future less upon political agitations and the opportunity of holding office, and more upon something more tangible and substantial. It was at this period in the Negro's development, when the distance between the races was greatest, and the spirit and ambition of the colored people most depressed, that the idea of industrial or business development was introduced and began to be made prominent. It did not take the more level-headed members of the race long to see that while the Negro in the South was surrounded by many difficulties, there was practically no line drawn and little race discrimination in the world of commerce, banking, storekeeping, manufacturing, and the skilled trades, and in agriculture, and that in this lay his great opportunity. They understood that, while the whites might object to a Negro's being a postmaster, they would not object to his being the president of a bank, and in the latter occupation they would give him assistance and encouragement. The colored people were quick to see that while the negro would not be invited as a rule to attend the white man's prayer-meeting, he would be invited every time to attend the stockholders' meeting of a business concern in which he had an interest and that he could buy property in practically any portion of the South where the white man could buy it. The white citizens were all the more willing to encourage the Negro in this economic or industrial development, because they saw that the prosperity of the Negro meant also the prosperity of the white man. They saw, too, that when a Negro became the owner of a home and was a taxpayer, having a regular trade or other occupation, he at once became a conservative and safe citizen and voter; one who would consider the interests of his whole

community before casting his ballot; and, further, one whose ballot could not be purchased.

One case in point is that of the twenty-eight teachers at our school in Tuskegee who applied for life-voting certificates under the new constitution of Alabama, not one was refused registration; and if I may be forgiven a personal reference, in my own case, the Board of Registers were kind enough to send me a special request to the effect that they wished me not to fail to register as a life voter. I do not wish to convey the impression that all worthy colored people have been registered in Alabama, because there have been many inexcusable and unlawful omissions; but, with few exceptions, the 2700 who have been registered represent the best Negroes in the state.

Though in some parts of the country he is now misunderstood, I believe that the time is going to come when matters can be weighed soberly, and when the whole people are going to see that president Roosevelt is, and has been from the first, in line with this policy,--that of encouraging the colored people who by industry and economy have won their way into the confidence and respect of their neighbors. Both before and since he became President I have had many conversations with him, and at all times I have found him enthusiastic over the plan that I have described.

The growth of the race in industrial and business directions within the last few years cannot perhaps be better illustrated than by the fact that what is now the largest secular national organization among the colored people is the National Negro Business League. This organization brings together annually hundreds of men and women who have worked their way up from the bottom to the point where they are now in some cases bankers, merchants, manufacturers, planters, etc. The sight of this body of men and women would surprise a large part of American citizens who do not really know the better side of the Negro's life.

It ought to be stated frankly here that at first, and for several years after the introduction of industrial training at such educational centres as Hampton and Tuskegee, there was opposition from colored people, and from portions of those Northern white people engaged in educational and missionary work among the colored people in the South. Most of those who manifested such opposition were actuated by the highest and most honest motives. From the first the rank and file of the blacks were quick to see the advantages of industrial training, as is shown by the fact that industrial schools have always been overcrowded. Opposition to industrial training was based largely on the old and narrow ground that it was something that the Southern white people favored, and therefore must be against the interests of the Negro. Again, others opposed it because they feared that it meant the abandonment of all political privileges, and the higher or classical education of the race. They feared that the final outcome would be the materialization of the Negro, and the smothering of his spiritual and aesthetic nature. Others felt that industrial education had for its object the limitation of the Negro's development, and the branding him for all time as a special hand-working class.

Now that enough time has elapsed for those who opposed it to see that it meant none of these things, opposition, except from a very few of the colored people living in Boston and Washington, has ceased, and this system has the enthusiastic support of the Negroes and of most of the whites who formerly opposed it. All are beginning to see that it was never meant that ALL Negro youths should secure industrial education, any more than it is meant that ALL white youths should pass through the Massachusetts Institute of Technology, or the Amherst Agricultural College, to the exclusion of such training as is given at Harvard, Yale, or Dartmouth; but that in a peculiar sense a large proportion of the Negro youths needed to have that education which would enable them to secure an economic foundation, without which no people can succeed in any of the higher walks of life.

It is because of the fact that the Tuskegee Institute began at the bottom, with work in the soil, in wood, in iron, in leather, that it has now developed to the point where it is able to furnish employment as teachers to twenty-eight Negro graduates of the best colleges in the country. This is about three times as many Negro college graduates as any other institution in the United States for the education of colored people employs, the total number of officers and instructors at Tuskegee being about one hundred and ten.

Those who once opposed this see now that while the Negro youth who becomes skilled in agriculture and a successful farmer may not be able himself to pass through a purely literary college, he is laying the foundation for his children and grandchildren to do it if desirable. Industrial education in this generation is contributing in the highest degree to make what is called higher education a success. It is now realized that in so far as the race has intelligent and skillful producers, the greater will be the success of the minister, lawyer, doctor, and teacher. Opposition has melted away, too, because all men now see that it will take a long time to "materialize" a race, millions of which hold neither houses nor railroads, nor bank stocks, nor factories, nor coal and gold mines.

Another reason for the growth of a better understanding of the objects and influence of industrial training is the fact, as before stated, that it has been taken up with such interest and activity by the Southern whites, and that it has been established at such universities as Cornell in the East, and in practically all of the state colleges of the great West.

It is now seen that the result of such education will be to help the black man to make for himself an independent place in our great American life. It was largely the poverty of the Negro that made him the prey of designing politicians immediately after the war; and wherever poverty and lack of industry exist to-day, one does not find in him that deep spiritual life which the race must in the future possess in a higher degree.

To those who still express the fear that perhaps too much stress is put upon industrial education for the Negro I would add that I should emphasize the same kind of training for any people, whether black or white, in the same stage of development as the masses of the colored people.

For a number of years this country has looked to Germany for much in the way of education, and a large number of our brightest men and women are sent there each year. The official reports show that in Saxony, Germany, alone, there are 287 industrial schools, or one such school to every 14,641 people. This is true of a people who have back of them centuries of wealth and culture. In the South I am safe in saying that there is not more than one effective industrial school for every 400,000 colored people.

A recent dispatch from Germany says that the German Emperor has had a kitchen fitted up in the palace for the single purpose of having his daughter taught cooking. If all classes and nationalities, who are in most cases thousands of years ahead of the Negro in the arts of civilization, continue their interest in industrial training, I cannot understand how any reasonable person can object to such education for a large part of a people who are in the poverty-stricken condition that is true of a large element of my race, especially when such hand training is combined, as it should be, with the best education of head and heart.

THE NEGRO IN THE REGULAR ARMY by Oswald Garrison Villard

When the Fifty-fourth Massachusetts Regiment stormed Fort Wagner July 18, 1863, only to be driven back with the loss of its colonel, Robert Gould Shaw, and many of its rank and file, it established for all time the fact that the colored soldier would fight and fight well. This had already been demonstrated in Louisiana by colored regiments under the command of General Godfrey Weitzel in the attack upon Port Hudson on May 27 of the same year. On that occasion regiments composed for the greater part of raw recruits, plantation hands with centuries of servitude under the lash behind them, stormed trenches and dashed upon cold steel in the hands of their former masters and oppressors. After that there was no more talk in the portion of the country of the "natural cowardice" of the negro. But the heroic qualities of Colonel Shaw, his social prominence and that of his officers, and the comparative nearness of their battlefield to the North, attracted greater and more lasting attention to the daring and bravery of their exploit, until it finally became fixed in many minds as the first real baptism of fire of colored American soldiers.

After Wagner the recruiting of colored regiments, originally opposed by both North and South, went on apace, particularly under the Federal government, which organized no less than one hundred and fifty-four, designated as "United States Colored Troops." Colonel Shaw's raising of a colored regiment aroused quite as much comment in the North because of the race prejudice it defied, as because of the novelty of the new organization. General Weitzel tendered his resignation the instant General B. F. Butler assigned black soldiers to his brigade, and was with difficulty induced to serve on. His change of mind was a wise one, and not only because these colored soldiers covered him with glory at Port Hudson. It was his good fortune to be the central figure in one of the dramatic incidents of a war that must ever rank among the most thrilling and tragic the world has seen. The black cavalrymen who rode into Richmond, the first of the Northern troops to enter the Southern capital, went in waving their sabres and crying to the negroes on the sidewalks, "We have come to set you free!" They were from the division of Godfrey Weitzel, and American history has no more stirring moment.

In the South, notwithstanding the raising in 1861 of a colored Confederate regiment by Governor Moore of Louisiana (a magnificent body of educated colored men which afterwards became the First Louisiana National Guards of General Weitzel's brigade and the first colored regiment in the Federal Army), the feeling against negro troops was insurmountable until the last days of the struggle. Then no straw could be overlooked. When, in December, 1863, Major-General Patrick R. Cleburne, who commanded a division of Hardee's Corps of the Confederate Army of the Tennessee, sent in a paper in which the employment of the slaves as soldiers of the South was vigorously advocated, Jefferson Davis indorsed it with the statement, "I deem it inexpedient at this time to give publicity to this paper, and request that it be suppressed." General Cleburne urged that "freedom within a reasonable time" be granted to every slave remaining true to the Confederacy, and was moved to this action by the valor of the Fifty-fourth Massachusetts, saying, "If they [the negroes] can be made to face and fight bravely against their former masters, how much more probable is it that with the allurement of a higher reward, and led by those masters, they would submit to discipline and face dangers?"

With the ending of the civil war the regular army of the United States was reorganized upon a peace footing by an act of Congress dated July 28, 1866. In just recognition of the bravery of the colored volunteers six regiments, the Ninth and Tenth Cavalry and the Thirty-eighth, Thirty-ninth, Fortieth, and Forth-first Infantry, were designated as colored regiments. When the army was again reduced in 1869, the Thirty-eighth and Forty-first became the Twenty-fourth Infantry, and the Thirty-ninth and Fortieth became the Twenty-fifth. This left four colored regiments in the regular army as it was constituted from 1870 until 1901. There has never been a colored artillery organization in the regular service.

To these new regiments came a motley mixture of veterans of volunteer organizations, newly released slaves, and some freedmen of several years' standing but without military experience. They were eager to learn, and soon showed the same traits which distinguish the black regiments to-day,--loyalty to their officers and to their colors, sobriety and courage, and a notable pride in the efficiency of their corps. But if ever officers had to "father and mother" their soldiers they were the company officers of these regiments. The captains in particular had to be bankers, secretaries, advisers, and judges for their men. As Lieutenant Grote Hutcheson has stated it, "The men knew nothing, and the non-commissioned officers but little more. From the very circumstances of their preceding life it could not be otherwise. They had no independence, no self-reliance, not a thought except for the present, and were filled with superstition." Yet the officers were determined to prove the wisdom of the experiment. To do this they were forced to give their own attention to the minutest details of military administration, and to act as non-commissioned officers. The total lack of education among the men necessitated an enormous amount of writing by the officers. In the Ninth Cavalry only one man was found able to write well enough to be sergeant-major, and not for several years was it possible to obtain troop clerks. When the Tenth Cavalry was being recruited an officer was sent to Philadelphia with the express purpose of picking up educated colored men for the non-commissioned positions. Difficult as the tasks of the officers thus were, most of them felt well repaid for their unusual labors by the affectionate regard in which they were held by their soldiers, and by the never-failing good humor with which the latter went about their duties.

As the years passed the character of the colored soldiers naturally changed. In place of the war veterans, and of the men whose chains of servitude had just been struck off, came young men from the North and East with more education and more self-reliance. They depended less upon their officers, both in the barracks and in the field, yet they reverenced and cared for them as much as did their predecessors. Their greatest faults then as now were gambling and quarreling. On the other hand, the negro regiments speedily became favorably known because of greater sobriety and of fewer desertions than among the white soldiers. It was the Ninth Cavalry which a few years ago astonished the army by reporting not a single desertion in twelve months, an unheard-of and perhaps undreamed-of record. In all that goes to make a good soldier, in drill, fidelity, and smartness, the negro regular from the first took front rank.

Nor was there ever any lack of the fighting quality which had gratified the nation at Fort Wagner, or at Fort Blakely, Ala., where the Seventy-third Colored Infantry, under Colonel Henry C. Merriam, stormed the enemy's works, in advance of orders, in one of the last actions of the war. It soon fell to the lot of the Ninth and Tenth Cavalry to prove that the negroes could do as well under fire in the Indian wars as they had when fighting for the freedom of their race. While the Twenty-fourth and Twenty-fifth Infantry had merely garrison work to do, the Ninth and Tenth Cavalry scouted for years against hostile Indians in Texas, New Mexico, Colorado, and Kansas, always acquitting themselves honorably. In September, 1868, a little over two years after their organization, three troops of the Ninth Cavalry did well in an action against Indians at Horsehead Hills, Texas. When General George A. Forsyth and his detachment of fifty scouts were surrounded and "corralled" by seven hundred Indians on an island in the Republican River, it was the troop of Captain Louis H. Carpenter, of the Tenth Cavalry, which first came to their rescue. Similarly when Major T. T. Thornburg's command was nearly wiped out by Utes in 1879, it was Captain F. S. Dodge's Troop D of the Ninth which succeeded in reaching it in time, losing all its horses in so doing. This regiment alone took part in sixty Indian fights between 1868 and 1890, during which time it lost three officers and twenty-seven men killed, and had three officers and thirty-four men wounded. The Tenth Cavalry's casualties were also heavy during this same period, and it fought for many years over a most difficult country in New Mexico and Arizona, taking a conspicuous part in running to earth Geronimo's and Victoria's bands of Apaches.

On one of these campaigns Lieutenant Powhatan H. Clarke gave effective proof of the affection which the officers of colored regiments have for their men. In the fight in the Pineto Mountains with a portion of Geronimo's forces this young Southerner risked his life to save a colored sergeant who had fallen wounded in an open space where both he and his rescuer were easy marks for the Apaches. For this gallant act Lieutenant Clarke rightly received a medal of honor. The Twenty-fourth Infantry, on the other hand, has contributed a striking instance of the devotion of colored soldiers to their officers. When Major Joseph W. Wham, paymaster, was attacked by robbers on May 11, 1889, his colored escort fought with such gallantry that every one of the soldiers was awarded

a medal of honor or a certificate of merit. Some of them stood their ground although badly wounded, notably Sergeant Benjamin Brown, who continued to fight and to encourage his men until shot through both arms. In a fight against Apaches in the Cuchilo Negro Mountains of New Mexico on August 16, 1881, Moses Williams, First Sergeant of Troop I, Ninth Cavalry, displayed such gallantry that he was given a medal of honor by common consent. When the only officer with the detachment, Lieutenant Gustavus Valois, had his horse shot under him, and was cut off from his men, Sergeant Williams promptly rallied the detachment, and conducted the right flank in a running fight for several hours with such coolness, bravery, and unflinching devotion to duty that he undoubtedly saved the lives of at least three comrades. His action in standing by and rescuing Lieutenant Valois was the more noteworthy because he and his men were subjected, in an exposed position, to a heavy fire from a large number of Indians. For splendid gallantry against Indians, while serving as sergeant of Troop K, Ninth Cavalry, on May 14, 1880, and August 12, 1881, George Jordan was also given a medal of honor. Five of the medal of honor men now in the service are colored soldiers, while fifteen others have "certificates of merit" also awarded for conspicuous deeds of bravery.

It was not until the battle of Santiago, however, that the bulk of the American people realized that the standing army comprised regiments composed wholly of black men. Up to that time only one company of colored soldiers had served at a post east of the Mississippi. Even Major, later Brigadier-General, Guy V. Henry's gallop to the rescue of the Seventh Cavalry on December 30, 1890, with four troops of the Ninth Cavalry, attracted but little attention. This feat was the more remarkable because Major Henry's command had just completed a march of more than one hundred miles in twenty-four hours. But in the battle at Santiago, the four colored regiments won praise from all sides, particularly for their advance upon Kettle Hill, in which the Rough Riders also figured. From the very beginning of the movement of the army after its landing, the negro troops were in the front of the fighting, and contributed largely to the successful result. Although they suffered heavy losses, especially in officers, the men fought with the same gallantry they had displayed on the plains, as is attested by the honors awarded. In every company there were instances of personal gallantry. The first sergeants especially lived up to the responsibilities placed upon them. The color sergeant of the Tenth Cavalry, Adam Houston, bore to the front not only his own flags, but those of the Third Cavalry when the latter's color sergeant was shot down. In several emergencies where troops or companies lost their white officers, the senior sergeants took command and handled their men in a faultless manner, notably in the Tenth Cavalry.

Indeed, the conduct of these men has done much to dispel the old belief that colored soldiers will fight only when they have efficient white officers. This may well have been true at one period of the civil war when the colored race as a whole had never even had the responsibilities attaching to free men. It is growing less and less true as time passes and better educated men enter the ranks. In recognition of their achievements at Santiago a number of these black non-commissioned officers were made commissioned officers in several of the so-called "immune" regiments of United States Volunteers raised in July, 1898. None of these organizations were in service long enough to become really efficient, and a few were never properly disciplined. Nevertheless, a majority of the officers promoted from the colored regulars bore themselves well under exceedingly trying circumstances. Some of them, and a number of regular sergeants and corporals who had succeeded to their former places, were made lieutenants and captains in the Forty-eighth and Forty-ninth Volunteer Infantry, which served in the Philippines for two years, and to which we shall recur later.

At Santiago the characteristic cheerfulness of the negro soldiers was as striking as their bravery. In his little book called The Nth Foot In War, Lieutenant M. B. Stewart says of them:--

"The negro troops were in a high good humor. They had made the charge of the day; they had fought with a dash and vigor which forever established their reputation as fighters, and which would carry them down in the pages of history. To have heard them that night no one would have ever thought that they had lived for twelve mortal hours under a galling fire. They were laughing and joking over the events of the day, in the same manner they would have done had they been returning from a picnic.

"'Golly,' laughed a six-foot sergeant, 'dere was music in de air sho' nuff. Dat lead was flying around in sheets, I tell you. I seen a buzzard flying around in front of our line, and I says to myself, "Buzzard, you is in a mighty dangerous position. You better git out uf dat, 'cause dey ain't room out dar for a muskeeter."' Another remarked, 'Say, did you see dat man Brown; pity dat man been killed. He'd a been a corporal, sho.'

"In the utter exhaustion of the moment all race and social distinctions were forgotten. Officers lay down among their men and slept like logs. The negro troops sought out soft places along the sides of the road and lay down with their white comrades. There was a little commotion among the latter, and an officer was heard to yell: 'Here, you man, take your feet off my stomach. Well, I'll be damned if it ain't a nigger. Get out, you black rascal.' As the commotion subsided, the negro was heard to remark, 'Well, if dat ain't

de mos' particler man I ever see.'"

Characteristic also is a story of the negro cavalryman who, returning to the rear, said to some troops anxious to get to the front: "Dat's all right, gemmen; don't git in a sweat; dere's lots of it lef' for you. You wants to look out for dese yere sharpshooters, for dey is mighty careless with dere weapons, and dey is specially careless when dey is officers aroun'."

As soon as the army settled down in the trenches before Santiago, smuggled musical instruments--guitars, banjos, mouth organs, and what not--appeared among the negro troops as if by magic, and they were ever in use. It was at once a scene of cheerfulness and gayety, and the officers had their usual trouble in making the men go to sleep instead of spending the night in talking, singing, and gaming. In the peaceful camp of the Third Alabama, in that state, the scenes were similar. There was always "a steady hum of laughter and talk, dance, song, shout, and the twang of musical instruments." It was "a scene full of life and fun, of jostling, scuffling, and racing, of clown performances and cake-walks, of impromptu minstrelsy, speech-making, and preaching, of deviling, guying, and fighting, both real and mimic." The colonel found great difficulty in getting men to work alone. Two would volunteer for any service. "Colonel," said a visitor to the camp, "your sentinels are sociable fellows. I saw No. 5 over at the end of his beat entertaining No. 6 with some fancy manual of arms. Afterwards, with equal amiability, No. 6 executed a most artistic cake-walk for his friend." It must be remembered here that this colonel's men were typical Southern negroes, literate and illiterate, and all new to military life.

In addition to the Forty-eighth and Forty-ninth Volunteers, the four regular colored regiments have served in the Philippines. Here the work was particularly trying and the temptations to misconduct many. The Filipino women were especially attractive to the men because of their color, and it is on record that several soldiers were tempted from their allegiance to the United States. Two of these, whose sympathy and liking for the Filipinos overcame their judgment, paid the full penalty of desertion, being hanged by their former comrades. Both belonged to the Ninth Cavalry. On the other hand, in a remarkable order issued by General A. S. Burt in relinquishing command of the Twenty-fifth Infantry, on April 17, 1902, on his promotion to brigadier-general, he was able to quote the Inspector-General of the army as saying: "The Twenty-fifth Infantry is the best regiment I have seen in the Philippines." General Burt praised highly the excellent conduct of the enlisted men while in the Archipelago, which proved to his mind that the American negroes are "as law-abiding as any race in the world."

Three of General Burt's sergeants, Russell, McBryar, and Hoffman, were promoted to the Forty-eighth and Forty-ninth Volunteers, and served, as lieutenants, for several months with their old regiment, the Twenty-fifth, until the arrival of their new regiments in Manila. During this time they were frequently under fire. General Burt bore high testimony to their soldierly bearing, their capacity and ability, and expressed great regret when he was forced to let them go. McBryar had won a medal of honor for gallantry against Indians in Arizona in 1890. In the Forty-ninth Volunteers, Company L, composed wholly of colored men, and commanded by Captain Edward L. Baker, a colored veteran of Santiago, who had served for seventeen years in the Ninth and Tenth Cavalry and in the Tenth "Immunes," made a wonderful record. According to a statement which was widely published at the time and never denied, this company had on its rolls during a period of twelve months one hundred and six men who were fit for duty at all times and never lost a day on account of sickness. No white company remotely approached this record. More extraordinary still is the fact that during this same period not one of these men ever went before a court-martial. This is surely a striking illustration of what can be done by colored officers. It is noticeable, too, that neither the officers nor the men of any colored regiment have figured in the charges and counter-charges arising out of the use of the water-torture, except one man who at the time of his offense was not with his regiment. The Forty-ninth Volunteers was a very unhappy regiment during its brief life, but its troubles were largely due to its white officers. One of these, a major, was dismissed for misconduct, and his place was filled by the senior captain, a colored man. Several other white officers and one colored captain got into serious trouble, the last being dismissed. The Forty-eighth was, on the contrary, a contented organization in which the colored officers were treated in a kindly and courteous manner by their white associates and superiors. The two regiments afford a striking illustration of Napoleon's saying, "There are no such things as poor regiments,--only poor colonels."

The negro regiment unquestionably calls for different treatment from that which would be accorded to white troops, just as the Indian troops of King Edward's army require different handling from that called for in the case of the King's Royal Rifles. Yet as fighting machines, the Indian soldiers may be the equals if not the superiors of the Englishmen. Major Robert L. Bullard, Twenty-eighth United States Infantry who commanded the colored Third Alabama Volunteers, already referred to, during the war with Spain, discusses in a remarkable paper published in the United Service Magazine for July, 1901, the differences between negro and white soldiers. They are so great, he says, as to require the military commander to treat the negro as a different species. He must fit his methods of instruction and discipline to the characteristics of the race. Major Bullard adds that "mistakes, injustices,

and failures would result from his making the same rules and methods apply to the two races without regard to how far apart set by nature or separated by evolution." But Major Bullard would unquestionably concede that these differences in no way require a treatment of the negro soldier which implies that he is an inferior being and which ever impresses upon him his inferiority. Yet this seems to have been the case in the Forty-ninth United States Volunteers.

In the regular army, as well as in the volunteers, officers have frequently appealed with success to the negroes' pride of race, and have urged them on to greater efficiency and better behavior by reminding them that they have the honor of their people in their hands. To such appeals there is ever a prompt response. One of the most effective ways of disciplining an offender is by holding him up to the ridicule of his fellows. The desire of the colored soldiers to amuse and to be amused gives the officers an easy way of obtaining a hold upon them and their affections. The regimental rifle team, the baseball nine, the minstrel troupe, and the regimental band offer positions of importance for which the competition is much keener than in the white regiments. There is also a friendly rivalry between companies, which is much missed elsewhere in the service. The negroes are natural horsemen and riders. It is a pleasure to them to take care of their mounts, and a matter of pride to keep their animals in good condition. Personally they are clean and neat, and they take the greatest possible pride in their uniforms. In no white regiment is there a similar feeling. With the negroes the canteen question is of comparatively slight importance, not only because the men can be more easily amused within their barracks, but because their appetite for drink is by no means as strong as that of the white men. Their sociability is astonishing. They would rather sit up and tell stories and crack jokes than go to bed, no matter how hard the day has been.

The dark sides are, that the negro soldiers easily turn merited punishment into martyrdom, that their gambling propensities are almost beyond control, that their habit of carrying concealed weapons is incurable, and that there is danger of serious fighting when they fall out with one another. Frequent failure to act honorably toward a comrade in some trifling matter is apt to cause scuffling and fighting until the men are well disciplined. Women are another cause of quarrels, and are at all times a potent temptation to misconduct and neglect of duty. It is very difficult to impress upon the men the value of government property, and duty which requires memorizing of orders is always the most difficult to teach. For the study of guard duty manuals or of tactics they have no natural aptitude. The non-commissioned officers are of very great importance, and in the regulars they are looked up to and obeyed implicitly, much more so than is the case with white troops. It is necessary, however, for the officers to back up the sergeants and corporals very vigorously, even when they are slightly in the wrong. Then colored men are more easily "rattled" by poor officers than are their white comrades. There was a striking instance of this two or three years ago when a newly appointed and wholly untrained white officer lost his head at a post in Texas. His black subordinates, largely recruits, followed suit, and in carrying out his hysterical orders imperiled many lives in the neighboring town. Selections for service with colored troops should therefore be most carefully made. Major Bullard declares that the officer of negro troops "must not only be an officer and a gentleman, but he must be considerate, patient, laborious, self-sacrificing, a man of affairs, and he must have knowledge and wisdom in a great lot of things not really military."

If the position of a white officer is a difficult one, that of the colored officer is still more so. He has not the self-assumed superiority of the white man, naturally feels that he is on trial, and must worry himself incessantly about his relations to his white comrades of the shoulder straps. While the United States Navy has hitherto been closed to negroes who aspire to be officers, the army has pursued a wiser and more just policy. The contrast between the two services is really remarkable. On almost every war vessel white and black sailors sleep and live together in crowded quarters without protest or friction. But the negro naval officer is kept out of the service by hook or by crook for the avowed reason that the cramped quarters of the wardroom would make association with him intolerable. In the army, on the other hand, the experiment of mixed regiments has never been tried. A good colored soldier can nevertheless obtain a commission by going through West Point, or by rising from the ranks, or by being appointed directly from civil life.

Since the foundation of the Military Academy there have been eighteen colored boys appointed to West Point, of whom fifteen failed in their preliminary examinations, or were discharged after entering because of deficiency in studies. Three were graduated and commissioned as second lieutenants of cavalry, Henry Ossian Flipper, John Hanks Alexander, and Charles Young. Of these, Lieutenant Flipper was dismissed June 30, 1882, for "conduct unbecoming an officer and a gentleman." The other two proved themselves excellent officers, notably Young, who is at this writing a captain, and a most efficient one, in the Ninth Cavalry, with which he recently served in the Philippines. Lieutenant Alexander died suddenly in 1894. In announcing his death in a regimental order his colonel spoke of him in terms of high praise, and did not use the customary stereotyped phrases of regret. His fellow white officers all had good words for him. There never was more striking testimony to the discipline and spirit of fairness at West Point than was afforded by the sight of Cadet Charles Young, who is of very dark complexion, commanding white cadets. Nothing else

has impressed foreign visitors at West Point half so much.

An equally remarkable happening, and one which speaks even more for the democratic spirit in the army, was the commissioning in 1901 of Sergeant-Major Benjamin O. Davis, Ninth Cavalry, and of Corporal John E. Green, Twenty-fourth Infantry. Both these men were examined by boards of white officers, who might easily have excluded them because of color prejudice, in which case there would have been no appeal from their findings. Lieutenant Davis's former troop commander, a West Pointer, openly rejoiced at his success, and predicted that he would make an excellent officer. These are the first two colored men to rise from the ranks, but there will be many more if the same admirable spirit of fair play continues to rule in the army and is not altered by outside prejudice. It was thought that there would be a severe strain upon discipline when a colored officer rose to the rank of captain and to the command of white officers. But in Captain Young's case his white subordinates seem to have realized that it is the position and rank that they are compelled to salute and obey, and not the individual. This principle is at the bottom of all discipline. Only too frequently do subordinates throughout the army have to remind themselves of this when obeying men for whose social qualities and character they have neither regard nor respect. During the war with Spain Captain Young commanded a negro battalion from Ohio, which was pronounced the best drilled organization in the large army assembled at Camp Alger near Washington. In addition to these officers, Captain John R. Lynch, formerly a Congressman from Mississippi, and four colored chaplains represent their race on the commissioned rolls of the army. All of these men are doing well. One colored chaplain was dismissed for drunkenness in 1894. Beyond this their record is unblemished.

Despite the fairness shown in these appointments, there has been considerable very just criticism of the War Department for its failure to appoint to the regulars any of the colored officers who did well in the Forty-eighth and Forty-ninth Volunteers. Every colonel of volunteers was allowed to designate for examination for appointment to the regular army the best officers in his regiment. Hundreds of white officers were selected in this way, but not a single colored officer was given an examination,--not even Lieutenant McBryar, with his medal of honor, or Captain Baker. Similarly fault has been found with Secretary Root because no new colored regiments were established under the law of February 2, 1901, increasing the army by five regiments of infantry, five of cavalry, and a large number of companies of artillery. The excuse most often heard is that the negroes already have sufficient representation in comparison with the percentage of negroes to white persons within the borders of the United States. But the sterling characteristics of the colored soldiers, their loyalty to the service as shown by the statistics of desertion, and, above all, their splendid service in Cuba, should have entitled them to additional organizations. To say the least, the decision of the War Department smacks considerably of ingratitude. Nevertheless, the negro regiments have come to stay, both in the regulars and in the volunteers. The hostilities of the last five years have dispelled any doubt which may have existed upon this point.

BAXTER'S PROCRUSTES by Charles W. Chesnutt

Baxter's Procrustes is one of the publications of the Bodleian Club. The Bodleian Club is composed of gentlemen of culture, who are interested in books and book-collecting. It was named, very obviously, after the famous library of the same name, and not only became in our city a sort of shrine for local worshipers of fine bindings and rare editions, but was visited occasionally by pilgrims from afar. The Bodleian has entertained Mark Twain, Joseph Jefferson, and other literary and histrionic celebrities. It possesses quite a collection of personal mementos of distinguished authors, among them a paperweight which once belonged to Goethe, a lead pencil used by Emerson, an autograph letter of Matthew Arnold, and a chip from a tree felled by Mr. Gladstone. Its library contains a number of rare books, including a fine collection on chess, of which game several of the members are enthusiastic devotees.

The activities of the club are not, however, confined entirely to books. We have a very handsome clubhouse, and much taste and discrimination have been exercised in its adornment. There are many good paintings, including portraits of the various presidents of the club, which adorn the entrance hall. After books, perhaps the most distinctive feature of the club is our collection of pipes. In a large rack in the smoking-room--really a superfluity, since smoking is permitted all over the house--is as complete an assortment of pipes as perhaps exists in the civilized world. Indeed, it is an unwritten rule of the club that no one is eligible for membership who cannot produce a new variety of pipe, which is filed with his application for membership, and, if he passes, deposited with the club collection, he, however, retaining the title in himself. Once a year, upon the anniversary of the death of Sir Walter Raleigh, who it will be remembered, first introduced tobacco into England, the full membership of the club, as a rule, turns out. A large supply of the very best smoking mixture is laid in. At nine o'clock sharp each member takes his pipe from the rack, fills it with tobacco, and then the whole club, with the president at the head, all smoking furiously, march in solemn procession from room to room, upstairs and downstairs, making the tour of the clubhouse and returning to the smoking-room. The president then delivers an address, and each

member is called upon to say something, either by way of a quotation or an original sentiment, in praise of the virtues of nicotine. This ceremony--facetiously known as "hitting the pipe"--being thus concluded, the membership pipes are carefully cleaned out and replaced in the club rack.

As I have said, however, the raison d'etre of the club, and the feature upon which its fame chiefly rests, is its collection of rare books, and of these by far the most interesting are its own publications. Even its catalogues are works of art, published in numbered editions, and sought by libraries and book-collectors. Early in its history it began the occasional publication of books which should meet the club standard,--books in which emphasis should be laid upon the qualities that make a book valuable in the eyes of collectors. Of these, age could not, of course, be imparted, but in the matter of fine and curious bindings, of hand-made linen papers, of uncut or deckle edges, of wide margins and limited editions, the club could control its own publications. The matter of contents was, it must be confessed, a less important consideration. At first it was felt by the publishing committee that nothing but the finest products of the human mind should be selected for enshrinement in the beautiful volumes which the club should issue. The length of the work was an important consideration,--long things were not compatible with wide margins and graceful slenderness. For instance, we brought out Coleridge's Ancient Mariner, an essay by Emerson, and another by Thoreau. Our Rubaiyat of Omar Khayyam was Heron-Allen's translation of the original MS in the Bodleian Library at Oxford, which, though less poetical than FitzGerald's, was not so common. Several years ago we began to publish the works of our own members. Bascom's Essay on Pipes was a very creditable performance. It was published in a limited edition of one hundred copies, and since it had not previously appeared elsewhere and was copyrighted by the club, it was sufficiently rare to be valuable for that reason. The second publication of local origin was Baxter's Procrustes.

I have omitted to say that once or twice a year, at a meeting of which notice has been given, an auction is held at the Bodleian. The members of the club send in their duplicate copies, or books they for any reason wish to dispose of, which are auctioned off to the highest bidder. At these sales, which are well attended, the club's publications have of recent years formed the leading feature. Three years ago, number three of Bascom's Essay on Pipes sold for fifteen dollars;--the original cost of publication was one dollar and seventy-five cents. Later in the evening an uncut copy of the same brought thirty dollars. At the next auction the price of the cut copy was run up to twenty-five dollars, while the uncut copy was knocked down at seventy-five dollars. The club had always appreciated the value of uncut copies, but this financial indorsement enhanced their desirability immensely. This rise in the Essay on Pipes was not without a sympathetic effect upon all the club publications. The Emerson essay rose from three dollars to seventeen, and the Thoreau, being by an author less widely read, and, by his own confession commercially unsuccessful, brought a somewhat higher figure. The prices, thus inflated, were not permitted to come down appreciably. Since every member of the club possessed one or more of these valuable editions, they were all manifestly interested in keeping up the price. The publication, however, which brought the highest prices, and, but for the sober second thought, might have wrecked the whole system, was Baxter's Procrustes.

Baxter was, perhaps, the most scholarly member of the club. A graduate of Harvard, he had traveled extensively, had read widely, and while not so enthusiastic a collector as some of us, possessed as fine a private library as any man of his age in the city. He was about thirty-five when he joined the club, and apparently some bitter experience--some disappointment in love or ambition--had left its mark upon his character. With light, curly hair, fair complexion, and gray eyes, one would have expected Baxter to be genial of temper, with a tendency toward wordiness of speech. But though he had occasional flashes of humor, his ordinary demeanor was characterized by a mild cynicism, which, with his gloomy pessimistic philosophy, so foreign to the temperament that should accompany his physical type, could only be accounted for upon the hypothesis of some secret sorrow such as I have suggested. What it might be no one knew. He had means and social position, and was an uncommonly handsome man. The fact that he remained unmarried at thirty-five furnished some support for the theory of a disappointment in love, though this the several intimates of Baxter who belonged to the club were not able to verify.

It had occurred to me, in a vague way, that perhaps Baxter might be an unsuccessful author. That he was a poet we knew very well, and typewritten copies of his verses had occasionally circulated among us. But Baxter had always expressed such a profound contempt for modern literature, had always spoken in terms of such unmeasured pity for the slaves of the pen, who were dependent upon the whim of an undiscriminating public for recognition and a livelihood, that no one of us had ever suspected him of aspirations toward publication, until, as I have said, it occurred to me one day that Baxter's attitude with regard to publication might be viewed in the light of effect as well as of cause--that his scorn of publicity might as easily arise from failure to achieve it, as his never having published might be due to his preconceived disdain of the vulgar popularity which one must share with the pugilist or balloonist of the hour.

The notion of publishing Baxter's Procrustes did not emanate from Baxter,--I must do him the justice to say this. But he had spoken to several of the fellows about the theme of his poem, until the notion that Baxter was at work upon something fine had become pretty well disseminated throughout our membership. He would occasionally read brief passages to a small coterie of friends in the sitting-room or library,--never more than ten lines at once, or to more than five people at a time,--and these excerpts gave at least a few of us a pretty fair idea of the motive and scope of the poem. As I, for one, gathered, it was quite along the line of Baxter's philosophy. Society was the Procrustes which, like the Greek bandit of old, caught every man born into the world, and endeavored to fit him to some preconceived standard, generally to the one for which he was least adapted. The world was full of men and women who were merely square pegs in round holes, and vice versa. Most marriages were unhappy because the contracting parties were not properly mated. Religion was mostly superstition, science for the most part sciolism, popular education merely a means of forcing the stupid and repressing the bright, so that all the youth of the rising generation might conform to the same dull, dead level of democratic mediocrity. Life would soon become so monotonously uniform and so uniformly monotonous as to be scarce worth the living.

It was Smith, I think, who first proposed that the club publish Baxter's Procrustes. The poet himself did not seem enthusiastic when the subject was broached; he demurred for some little time, protesting that the poem was not worthy of publication. But when it was proposed that the edition be limited to fifty copies he agreed to consider the proposition. When I suggested, having in mind my secret theory of Baxter's failure in authorship, that the edition would at least be in the hands of friends, that it would be difficult for a hostile critic to secure a copy, and that if it should not achieve success from a literary point of view, the extent of the failure would be limited to the size of the edition, Baxter was visibly impressed. When the literary committee at length decided to request formally of Baxter the privilege of publishing his Procrustes, he consented, with evident reluctance, upon condition that he should supervise the printing, binding, and delivery of the books, merely submitting to the committee, in advance, the manuscript, and taking their views in regard to the bookmaking.

The manuscript was duly presented to the literary committee. Baxter having expressed the desire that the poem be not read aloud at a meeting of the club, as was the custom, since he wished it to be given to the world clad in suitable garb, the committee went even farther. Having entire confidence in Baxter's taste and scholarship, they, with great delicacy, refrained from even reading the manuscript, contenting themselves with Baxter's statement of the general theme and the topics grouped under it. The details of the bookmaking, however, were gone into thoroughly. The paper was to be of hand-made linen, from the Kelmscott Mills; the type black-letter, with rubricated initials. The cover, which was Baxter's own selection, was to be of dark green morocco, with a cap-and-bells border in red inlays, and doublures of maroon morocco with a blind-tooled design. Baxter was authorized to contract with the printer and superintend the publication. The whole edition of fifty numbered copies was to be disposed of at auction, in advance, to the highest bidder, only one copy to each, the proceeds to be devoted to paying for the printing and binding, the remainder, if any, to go into the club treasury, and Baxter himself to receive one copy by way of remuneration. Baxter was inclined to protest at this, on the ground that his copy would probably be worth more than the royalties on the edition, at the usual ten per cent, would amount to, but was finally prevailed upon to accept an author's copy.

While the Procrustes was under consideration, some one read, at one of our meetings, a note from some magazine, which stated that a sealed copy of a new translation of Campanella's Sonnets, published by the Grolier Club, had been sold for three hundred dollars. This impressed the members greatly. It was a novel idea. A new work might thus be enshrined in a sort of holy of holies, which, if the collector so desired, could be forever sacred from the profanation of any vulgar or unappreciative eye. The possessor of such a treasure could enjoy it by the eye of imagination, having at the same time the exaltation of grasping what was for others the unattainable. The literary committee were so impressed with this idea that they presented it to Baxter in regard to the Procrustes. Baxter making no objection, the subscribers who might wish their copies delivered sealed were directed to notify the author. I sent in my name. A fine book, after all, was an investment, and if there was any way of enhancing its rarity, and therefore its value, I was quite willing to enjoy such an advantage.

When the Procrustes was ready for distribution, each subscriber received his copy by mail, in a neat pasteboard box. Each number was wrapped in a thin and transparent but very strong paper through which the cover design and tooling were clearly visible. The number of the copy was indorsed upon the wrapper, the folds of which were securely fastened at each end with sealing-wax, upon which was impressed, as a guaranty of its inviolateness, the monogram of the club.

At the next meeting of the Bodleian, a great deal was said about the Procrustes, and it was unanimously agreed that no finer specimen of bookmaking had ever been published by the club. By a curious coincidence, no one had brought his copy with him, and the two club copies had not yet been received from the binder, who, Baxter had reported was retaining them for some extra

fine work. Upon resolution, offered by a member who had not subscribed for the volume, a committee of three was appointed to review the Procrustes at the next literary meeting of the club. Of this committee it was my doubtful fortune to constitute one.

In pursuance of my duty in the premises, it of course became necessary for me to read the Procrustes. In all probability I should have cut my own copy for this purpose, had not one of the club auctions intervened between my appointment and the date set for the discussion of the Procrustes. At this meeting a copy of the book, still sealed, was offered for sale, and bought by a non-subscriber for the unprecedented price of one hundred and fifty dollars. After this a proper regard for my own interests would not permit me to spoil my copy by opening it, and I was therefore compelled to procure my information concerning the poem from some other source. As I had no desire to appear mercenary, I said nothing about my own copy, and made no attempt to borrow. I did, however, casually remark to Baxter that I should like to look at his copy of the proof sheets, since I wished to make some extended quotations for my review, and would rather not trust my copy to a typist for that purpose. Baxter assured me, with every evidence of regret, that he had considered them of so little importance that he had thrown them into the fire. This indifference of Baxter to literary values struck me as just a little overdone. The proof sheets of Hamlet, corrected in Shakespeare's own hand, would be well-nigh priceless.

At the next meeting of the club I observed that Thompson and Davis, who were with me on the reviewing committee, very soon brought up the question of the Procrustes in conversation in the smoking-room, and seemed anxious to get from the members their views concerning Baxter's production, I supposed upon the theory that the appreciation of any book review would depend more or less upon the degree to which it reflected the opinion of those to whom the review should be presented. I presumed, of course, that Thompson and Davis had each read the book,--they were among the subscribers,--and I was desirous of getting their point of view.

"What do you think," I inquired, "of the passage on Social Systems?" I have forgotten to say that the poem was in blank verse, and divided into parts, each with an appropriate title.

"Well," replied Davis, it seemed to me a little cautiously, "it is not exactly Spencerian, although it squints at the Spencerian view, with a slight deflection toward Hegelianism. I should consider it an harmonious fusion of the best views of all the modern philosophers, with a strong Baxterian flavor."

"Yes," said Thompson, "the charm of the chapter lies in this very quality. The style is an emanation from Baxter's own intellect,--he has written himself into the poem. By knowing Baxter we are able to appreciate the book, and after having read the book we feel that we are so much the more intimately acquainted with Baxter,--the real Baxter."

Baxter had come in during this colloquy, and was standing by the fireplace smoking a pipe. I was not exactly sure whether the faint smile which marked his face was a token of pleasure or cynicism; it was Baxterian, however, and I had already learned that Baxter's opinions upon any subject were not to be gathered always from his facial expression. For instance, when the club porter's crippled child died Baxter remarked, it seemed to me unfeelingly, that the poor little devil was doubtless better off, and that the porter himself had certainly been relieved of a burden; and only a week later the porter told me in confidence that Baxter had paid for an expensive operation, undertaken in the hope of prolonging the child's life. I therefore drew no conclusions from Baxter's somewhat enigmatical smile. He left the room at this point in the conversation, somewhat to my relief.

"By the way, Jones," said Davis, addressing me, "are you impressed by Baxter's views on Degeneration?"

Having often heard Baxter express himself upon the general downward tendency of modern civilization, I felt safe in discussing his views in a broad and general manner.

"I think," I replied, "that they are in harmony with those of Schopenhauer, without his bitterness; with those of Nordau, without his flippancy. His materialism is Haeckel's, presented with something of the charm of Omar Khayyam."

"Yes," chimed in Davis, "it answers the strenuous demand of our day,--dissatisfaction with an unjustified optimism,--and voices for us the courage of human philosophy facing the unknown."

I had a vague recollection of having read something like this somewhere, but so much has been written, that one can scarcely discuss any subject of importance without unconsciously borrowing, now and then, the thoughts or the language of others. Quotation, like imitation, is a superior grade of flattery.

"The Procrustes," said Thompson, to whom the metrical review had been apportioned, "is couched in sonorous lines, of haunting melody and charm; and yet so closely inter-related as to be scarcely quotable with justice to the author. To be appreciated the

poem should be read as a whole,--I shall say as much in my review. What shall you say of the letter-press?" he concluded, addressing me. I was supposed to discuss the technical excellence of the volume from the connoisseur's viewpoint.

"The setting," I replied judicially, "is worthy of the gem. The dark green cover, elaborately tooled, the old English lettering, the heavy linen paper, mark this as one of our very choicest publications. The letter-press is of course De Vinne's best,--there is nothing better on this side of the Atlantic. The text is a beautiful, slender stream, meandering gracefully through a wide meadow of margin."

For some reason I left the room for a minute. As I stepped into the hall, I almost ran into Baxter, who was standing near the door, facing a hunting print of a somewhat humorous character, hung upon the wall, and smiling with an immensely pleased expression.

"What a ridiculous scene!" he remarked. "Look at that fat old squire on that tall hunter! I'll wager dollars to doughnuts that he won't get over the first fence!"

It was a very good bluff, but did not deceive me. Under his mask of unconcern, Baxter was anxious to learn what we thought of his poem, and had stationed himself in the hall that he might overhear our discussion without embarrassing us by his presence. He had covered up his delight at our appreciation by this simulated interest in the hunting print.

When the night came for the review of the Procrustes there was a large attendance of members, and several visitors, among them a young English cousin of one of the members, on his first visit to the United States; some of us had met him at other clubs, and in society, and had found him a very jolly boy, with a youthful exuberance of spirits and a naive ignorance of things American that made his views refreshing and, at times, amusing.

The critical essays were well considered, if a trifle vague. Baxter received credit for poetic skill of a high order.

"Our brother Baxter," said Thompson, "should no longer bury his talent in a napkin. This gem, of course, belongs to the club, but the same brain from which issued this exquisite emanation can produce others to inspire and charm an appreciative world."

"The author's view of life," said Davis, "as expressed in these beautiful lines, will help us to fit our shoulders for the heavy burden of life, by bringing to our realization those profound truths of philosophy which find hope in despair and pleasure in pain. When he shall see fit to give to the wider world, in fuller form, the thoughts of which we have been vouchsafed this foretaste, let us hope that some little ray of his fame may rest upon the Bodleian, from which can never be taken away the proud privilege of saying that he was one of its members."

I then pointed out the beauties of the volume as a piece of bookmaking. I knew, from conversation with the publication committee, the style of type and rubrication, and could see the cover through the wrapper of my sealed copy. The dark green morocco, I said, in summing up, typified the author's serious view of life, as a thing to be endured as patiently as might be. The cap-and-bells border was significant of the shams by which the optimist sought to delude himself into the view that life was a desirable thing. The intricate blind-tooling of the doublure shadowed forth the blind fate which left us in ignorance of our future and our past, or of even what the day itself might bring forth. The black-letter type, with rubricated initials, signified a philosophic pessimism enlightened by the conviction that in duty one might find, after all, an excuse for life and a hope for humanity. Applying this test to the club, this work, which might be said to represent all that the Bodleian stood for, was in itself sufficient to justify the club's existence. If the Bodleian had done nothing else, if it should do nothing more, it had produced a masterpiece.

There was a sealed copy of the Procrustes, belonging, I believe, to one of the committee, lying on the table by which I stood, and I had picked it up and held it in my hand for a moment, to emphasize one of my periods, but had laid it down immediately. I noted, as I sat down, that young Hunkin, our English visitor, who sat on the other side of the table, had picked up the volume and was examining it with interest. When the last review was read, and the generous applause had subsided, there were cries for Baxter.

"Baxter! Baxter! Author! Author!"

Baxter had been sitting over in a corner during the reading of the reviews, and had succeeded remarkably well, it seemed to me, in concealing, under his mask of cynical indifference, the exultation which I was sure he must feel. But this outburst of enthusiasm was too much even for Baxter, and it was clear that he was struggling with strong emotion when he rose to speak.

"Gentlemen, and fellow members of the Bodleian, it gives me unaffected pleasure--sincere pleasure--some day you may know how much pleasure--I cannot trust myself to say it now--to see the evident care with which your committee have read my poor verses, and the responsive sympathy with which my friends have entered into my views of life and conduct. I thank you again, and again,

and when I say that I am too full for utterance,--I'm sure you will excuse me from saying any more."

Baxter took his seat, and the applause had begun again when it was broken by a sudden exclamation.

"By Jove!" exclaimed our English visitor, who still sat behind the table, "what an extraordinary book!"

Every one gathered around him.

"You see," he exclaimed; holding up the volume, "you fellows said so much about the bally book that I wanted to see what it was like; so I untied the ribbon, and cut the leaves with the paper knife lying here, and found--and found that there wasn't a single line in it, don't you know!"

Blank consternation followed this announcement, which proved only too true. Every one knew instinctively, without further investigation, that the club had been badly sold. In the resulting confusion Baxter escaped, but later was waited upon by a committee, to whom he made the rather lame excuse that he had always regarded uncut and sealed books as tommy-rot, and that he had merely been curious to see how far the thing could go; and that the result had justified his belief that a book with nothing in it was just as useful to a book-collector as one embodying a work of genius. He offered to pay all the bills for the sham Procrustes, or to replace the blank copies with the real thing, as we might choose. Of course, after such an insult, the club did not care for the poem. He was permitted to pay the expense, however, and it was more than hinted to him that his resignation from the club would be favorably acted upon. He never sent it in, and, as he went to Europe shortly afterwards, the affair had time to blow over.

In our first disgust at Baxter's duplicity, most of us cut our copies of the Procrustes, some of us mailed them to Baxter with cutting notes, and others threw them into the fire. A few wiser spirits held on to theirs, and this fact leaking out, it began to dawn upon the minds of the real collectors among us that the volume was something unique in the way of a publication.

"Baxter," said our president one evening to a select few of us who sat around the fireplace, "was wiser than we knew, or than he perhaps appreciated. His Procrustes, from the collector's point of view, is entirely logical, and might be considered as the acme of bookmaking. To the true collector, a book is a work of art, of which the contents are no more important than the words of an opera. Fine binding is a desideratum, and, for its cost, that of the Procrustes could not be improved upon. The paper is above criticism. The true collector loves wide margins, and the Procrustes, being all margin, merely touches the vanishing point of the perspective. The smaller the edition, the greater the collector's eagerness to acquire a copy. There are but six uncut copies left, I am told, of the Procrustes, and three sealed copies, of one of which I am the fortunate possessor."

After this deliverance, it is not surprising that, at our next auction, a sealed copy of Baxter's Procrustes was knocked down, after spirited bidding, for two hundred and fifty dollars, the highest price ever brought by a single volume published by the club.

THE HEART OF THE RACE PROBLEM by Quincy Ewing

"And, instead of going to the Congress of the United States and saying there is no distinction made in Mississippi, because of color or previous condition of servitude, tell the truth, and say this: 'We tried for many years to live in Mississippi, and share sovereignty and dominion with the Negro, and we saw our institutions crumbling.... We rose in the majesty and highest type of Anglo-Saxon manhood, and took the reins of government out of the hands of the carpet-bagger and the Negro, and, so help us God, from now on we will never share any sovereignty or dominion with him again.'"--Governor JAMES K. VARDAMAN, Mississippi, 1904.

During the past decade, newspaper and magazine articles galore, and not a few books, have been written on what is called the "Race Problem," the problem caused by the presence in this country of some ten millions of black and variously-shaded colored people known as Negroes. But, strange as it may sound, the writer has no hesitation in saying that at this date there appears to be no clear conception anywhere, on the part of most people, as to just what the essential problem is which confronts the white inhabitants of the country because they have for fellow-citizens (nominally) ten million Negroes. Ask the average man, ask even the average editor or professor anywhere, what the race problem is, the heart of it; why, in this land with its millions of foreigners of all nationalities, THE race problem of problems should be caused by ten million Negroes, not foreigners but native to the soil through several generations; and in all probability you will get some such answer as this:--

"The Negroes, as a rule, are very ignorant, are very lazy, are very brutal, are very criminal. But a little way removed from savagery, they are incapable of adopting the white man's moral code, of assimilating the white man's moral sentiments, of striving toward the white man's moral ideals. They are creatures of brutal, untamed instincts, and uncontrolled feral passions, which give frequent

expression of themselves in crimes of horrible ferocity. They are, in brief, an uncivilized, semi-savage people, living in a civilization to which they are unequal, partaking to a limited degree of its benefits, performing in no degree its duties. Because they are spatially in a civilization to which they are morally and intellectually repugnant, they cannot but be as a foreign irritant to the body social. The problem is, How shall the body social adjust itself, daily, hourly, to this irritant; how feel at ease and safe in spite of it? How shall the white inhabitants of the land, with their centuries of inherited superiority, conserve their civilization and carry it forward to a yet higher plane, hampered by ten million black inhabitants of the same land with their centuries of inherited inferiority?"

To the foregoing answer, this might now and again be added, or advanced independently in reply to our question: "Personal aversion on the part of the white person for the Negro; personal aversion accounted for by nothing the individual Negro is, or is not, intellectually and morally; accounted for by the fact, simply, that he is a Negro, that he has a black or colored skin, that he is different, of another kind."

Now, certainly, there are very few average men or philosophers, to whom the answer given to our question would not seem to state, or at any rate fairly indicate, the race problem in its essence. But, however few they be, I do not hesitate to align myself with them as one who does not believe that the essential race problem as it exists in the South (whatever it be in the North) is stated, or even fairly indicated, in the foregoing answer. In Northern and Western communities, where he is outnumbered by many thousands of white people, the Negro may be accounted a problem, because he is lazy, or ignorant, or brutal, or criminal, or all these things together; or because he is black and different. But in Southern communities, where the Negro is not outnumbered by many thousands of white people, the race problem, essentially, and in its most acute form, is something distinct from his laziness or ignorance, or brutality, or criminality, or all-round intellectual and moral inferiority to the white man. That problem as the South knows and deals with it would exist, as certainly as it does to-day, if there were no shadow of excuse for the conviction that the Negro is more lazy, or more ignorant, or more criminal, or more brutal, or more anything else he ought not to be, or less anything else he ought to be, than other men. In other words, let it be supposed that the average Negro is as a matter of fact the equal, morally and intellectually, of the average white man of the same class, and the race problem declines to vanish, declines to budge. We shall see why, presently. The statements just made demand immediate justification. For they are doubtless surprising to a degree, and to some readers may prove startling.

I proceed to justify them as briefly as possible, asking the reader to bear in mind that very much more might be said along this line than I allow myself space to say.

I

That the Negro is not a problem because he is lazy, because he declines to work, is evidenced by the patent fact that in virtually every Southern community he is sought as a laborer in fields, mills, mines, and that in very many Southern communities the vexing problem for employers is not too many, but too few Negroes. In certain agricultural sections, notably in the Louisiana sugar district, quite a number of Italians ("Dagoes") are employed. The reason is not dissatisfaction with Negro labor, but simply that there is not enough of it to meet the requirements of the large plantations. There is, perhaps, not one of these plantations on which any able-bodied Negro could not get employment for the asking; and as a rule, the Negroes are given, not the work which demands the lowest, but that which demands the highest, efficiency: they are the ploughmen, the teamsters, the foremen. If any one doubts that Negroes are wanted as laborers in Southern communities, very much wanted, let him go to any such community and attempt to inveigle a few dozen of the laziest away. He will be likely to take his life in his hands, after the usual warning is disregarded!

II

The small politician's trump-card, played early and late, and in all seasons, that the Negro is a black shadow over the Southland because of his excessive criminality, serves well the politician's purpose,--it wins his game; but only because the game is played and won on a board where fictions, not facts, are dominant. Nothing is easier than to offer so-called proofs of the contention that the Negro's tendency to crime is something peculiar to his race; there are the jail and penitentiary and gallows statistics, for instance. But surely it should not be difficult for these so-called proofs to present themselves in their true light to any one who takes the trouble to consider two weighty and conspicuous facts: this, first, that the Negroes occupy everywhere in this country the lowest social and industrial plane, the plane which everywhere else supplies the jail, the penitentiary, the gallows, with the greatest number of their victims; and secondly this, that in the section of the country where these penal statistics are gathered, all the machinery of justice is in the hands of white men.

No Negro is a sheriff, or judge, or justice of the peace, or grand or petit juryman, or member of a pardoning board. Charged with crime, again and again, the black man must go to jail; he is unable to give bond; he is defended, not by the ablest, but by the poorest lawyers, often by an unwilling appointee of the court; he lacks the benefit of that personal appeal to judge and jury, so often enjoyed by other defendants, which would make them WANT to believe him innocent until proven guilty; he faces, on the contrary, a judge and jury who hold him in some measure of contempt as a man, regardless of his guilt or innocence. He is without means, except occasionally, to fight his case through appeals to higher courts, and errors sleep in many a record that on review would upset the verdict. In the light of such considerations, it would seem impossible that criminal statistics should not bear hard upon the Negro race, even supposing it to be a fact that that race of all races in the world is the LEAST criminal.

Let it be admitted without question that in most Southern communities the crimes and misdemeanors of the Negroes exceed those committed by an equal number of white people, and we have admitted nothing that at all explains or accounts for the race problem. For is it not equally true that in every other community the doers of society's rough work, the recipients of its meagrest rewards, are chargeable, relatively, with the greatest number of crimes and misdemeanors? Is it not true, as well in Massachusetts and Connecticut as in Louisiana and Mississippi, that the vast majority of those occupying prison cells are members of the social lowest class? that the vast majority condemned, after trial, to hard labor with their hands were accustomed to such labor before their judicial condemnation? Nothing is more preposterous than the idea that the race problem means more Negroes hanged, more Negroes imprisoned, more Negroes in mines and chain-gangs, than white people! If the Negro did not furnish the great bulk of the grist for the grinding of our penal machinery in the Southern states, he would constitute the racial miracle of this and all ages!

My own conviction is, and I speak with the experience of forty years' residence in Southern states, that the Negro is not more given to crimes and misdemeanors than the laboring population of any other section of the country. But be this as it may, it is abundantly certain that no race of people anywhere are more easily controlled than the Negroes by the guardians of law and order; and there are none anywhere so easily punished for disobedience to the statutes and mandates of their economic superiors. Courts and juries may be sometimes subject to just criticism for undue leniency toward white defendants; but that courts and juries are ever subject to just criticism for undue leniency in dealing with black defendants is the sheerest nonsense.

The frequent charge that the Negro's worst crimes partake of a brutality that is peculiarly racial, is not supported by facts. I need not enlarge upon this statement further than to say that the Negro's worst crimes, with all their shocking accompaniments, are, not seldom, but often, duplicated by white men. Let any one who doubts the statement observe for one week the criminal statistics of any cosmopolitan newspaper, and he will have his doubt removed.

Assuredly we do not hit upon the essence of the race problem in the Negro's propensity to crime!

III

Do we hit upon it in his ignorance, in the fact that an immense number of the black people are illiterate, not knowing the first from the last letter of the alphabet? Hardly. For, almost to a man, the people who most parade and most rail at the race problem in private conversation, on the political platform, and in the pages of newspapers, books, and periodicals, are disposed rather to lament, than to assist, the passing of the Negro's ignorance. Ex-Governor Vardaman, of Mississippi, used the following language in a message to the legislature of that state, January, 1906:--

"The startling facts revealed by the census show that those [Negroes] who can read and write are more criminal than the illiterate, which is true of no other element of our population.. .. The state for many years, at great expense to the tax-payers, has maintained a system of Negro education which has produced disappointing results, and I am opposed to the perpetuation of this system. My own idea is, that the character of education for the Negro ought to be changed. If, after forty years of earnest effort, and the expenditure of fabulous sums to educate his head, we have only succeeded in making a criminal of him and impairing his usefulness and efficiency as a laborer, wisdom would suggest that we make another experiment and see if we cannot improve him by educating his hand and his heart.... Slavery is the only process by which he has ever been partially civilized. God Almighty created the Negro for a menial, he is essentially a servant."

This is the reply of an ex-governor of one of our blackest states to those who contend that the negro is a problem, a "burden carried by the white people of the South," because of his ignorance and consequent inefficiency; and that the lightening of the burden depends upon more money spent, more earnest efforts made, for the schooling of the black people. According to this ex-governor, and there are thousands who agree with him in and out of Mississippi, the race problem is heightened, rather than mitigated, by all

attempts to increase the negro's intellectual efficiency. The more ignorant he is, the less burdensome he is to the white man, provided his heart be good, and his hands skillful enough to do the service of a menial. Nothing but slavery ever partially civilized him, nothing but slavery continued in some form can civilize him further!

IV

If we listen vainly for the heart-throb of the race problem in the Negro's laziness, and criminality, and brutality, and ignorance, and inefficiency, do we detect it with clearness and certainty in the personal aversion felt by the white people for the black people, aversion which the white people can no more help feeling than the black people can help exciting? Is this the real trouble, the real burden, the real tragedy and sorrow of our white population in those sections of the country where the Negroes are many,--that they are compelled to dwell face to face, day by day, with an inferior, degraded population, repulsive to their finer sensibilities, obnoxious to them in countless ways inexplicable? Facts are far from furnishing an affirmative answer. However pronounced may be the feeling of personal aversion toward the Negroes in Northern communities, where they are few, or known at long range, or casually, there is no such thing in Southern communities as personal aversion for the Negro pronounced enough to be responsible for anything resembling a problem. How could there be in the South, where from infancy we have all been as familiar with black faces as with white; where many of us fell asleep in the laps of black mammies, and had for playmates Ephrom, Izik, Zeke, black mammy's grandchildren; where most of us have had our meals prepared by black cooks, and been waited on by black house-servants and dining-room servants, and ridden in carriages and buggies with black hostlers? We are so used to the black people in the South, their mere personal presence is so far from being responsible for our race problem, that the South would not seem Southern without them, as it would not without its crape myrtles, and live-oaks, and magnolias, its cotton and its sugar-cane!

It is very easy to go astray in regard to the matter of personal aversion toward the members of alien races, to magnify greatly the reality and importance of it. What seems race-aversion is frequently something else, namely, revulsion aroused by the presence of the strange, the unusual, the uncanny, the not-understood. Such revulsion is aroused, not only by the members of alien races, alien and unfamiliar, but as certainly by strange animals of not more terrifying appearance than the well-loved cow and horse; and it would be aroused as really and as painfully, doubtless, by the sudden proximity of one of Milton's archangels. It was not necessarily race-aversion which made Emerson, and may have made many another Concord philosopher, uncomfortable in the presence of a Negro, any more than it is race-aversion which makes the Fifth Avenue boy run from the gentle farmyard cow; any more than it is race-aversion which would make me uncomfortable in the presence of Li Hung Chang. The Negro, simply, it may be, was a mystery to Emerson, as the farmyard cow is a mystery to the Fifth Avenue boy, as the Chinaman is a mystery to me.

The Negro is NOT a mystery to people whom he has nursed and waited on, whose language he has spoken, whose ways, good and bad, he has copied for generations; and his personal presence does not render them uncomfortable, not, at any rate, uncomfortable enough to beget the sense of a burden or a problem.

It may be very difficult for Northern readers, to whom the Negro is in reality a stranger, a foreigner, to appreciate fully the force of what has just been said; but appreciated by them it must be, or they can never hope to realize the innermost meaning of the race problem in the South.

So much for what the race problem is not. Let me without further delay state what it is. The foundation of it, true or false, is the white man's conviction that the Negro as a race, and as an individual, is his inferior: not human in the sense that he is human, not entitled to the exercise of human rights in the sense that he is entitled to the exercise of them. The problem itself, the essence of it, the heart of it, is the white man's determination to make good this conviction, coupled with constant anxiety lest, by some means, he should fail to make it good. The race problem, in other words, is NOT that the Negro is what he is in relation to the white man, the white man's inferior; but this, rather: How to keep him what he is in relation to the white man; how to prevent his ever achieving or becoming that which would justify the belief on his part, or on the part of other people, that he and the white man stand on common human ground.

That such is the heart of the problem should be made evident by this general consideration alone: namely, that everywhere in the South friction between the races is entirely absent so long as the Negro justifies the white man's opinion of him as an inferior; is grateful for privileges and lays no claim to RIGHTS. Let him seem content to be as the South insists he shall be, and not only is he not harshly treated, not abused, and never boycotted, but he is shown much kindness and generosity, and employment awaits him for the asking. Trouble brews when he begins to manifest those qualities, to reveal those tastes, to give vent to those ambitions, which are supposed to be characteristic exclusively of the higher human type, and which, unless restrained, would result in

confounding the lower with the higher. The expression "Good Nigger" means everywhere in the South a real Negro, from the Southern standpoint, one who in no respect gets out of focus with that standpoint; the expression "Bad Nigger" means universally one who in some respect, not necessarily criminal, does get out of focus with it. So, stated differently, the race problem is the problem how to keep the Negro in focus with the traditional standpoint.

But we are very far from needing to rely upon any general consideration in support of the proposition advanced above. It is supported by evidences on every hand, waiting only the eye of recognition. Scarcely a day passes but something is said or done with this end in view, to emphasize, lest they forget, the conviction for both white man and Negro that the latter is and must remain an inferior. Let me instance a few such evidences.

Consider, first, the "Jim Crow" legislation in the manner of its enforcement. Such legislation is supposed to have for its object the separation of the races in trains, street-cars, etc., to save the white people from occasional contact with drunken, rowdy, ill-smelling Negroes, and to prevent personal encounters between the whites and blacks. How is this object attained in the street cars of Southern cities? Members of the different races occupy the same cars, separated only by absurdly inadequate little open-mesh wire screens, so tiny and light that a conductor can move them from one seat to another with the strength of his little finger. Needless to add, these screens would serve to obscure neither sound, sight, nor smell of drunken rowdies who sat behind them! In summer cars black and white passengers may be separated not even by a make-believe screen; they are simply required, respectively, to occupy certain seats in the front or the back end of the cars.

In Birmingham, Alabama, the front seats are assigned to Negroes in all closed cars, and the back seats in all open ones. Why the front seats in the one case, and the back seats in the other, it is not easy to understand in the light of the letter and alleged spirit of the Jim Crow law! The underlying purpose of the law is clearly not the separation of the races in space; for public sentiment does not insist upon its fulfillment to that end. The underlying purpose of it would seem to be the separation of the races in status. The doctrine of inequality would be attacked if white and black passengers rode in public conveyances on equal terms; therefore the Negro who rides in a public conveyance must do so, not as of undoubted right, but as with the white man's permission, subject to the white man's regulation. "This place you may occupy, that other you may not, because I am I and you are you, lest to you or me it should be obscured that I am I and you are you." Such is the real spirit of the Jim Crow laws.

Why is it that in every Southern city no Negro is allowed to witness a dramatic performance, or a baseball game, from a first-class seat? In every large city, there are hundreds of Negroes who would gladly pay for first-class seats at the theatre and the baseball game, were they permitted to. It can hardly be that permission is withheld because theatres and baseball games are so well attended by half the population that first-class seats could not be furnished for the other half. As a matter of fact, theatre-auditoriums and baseball grand-stands are seldom crowded; the rule is, not all first-class seats occupied, but many vacant. Surely as simple as moving from seat to seat a make-shift screen in a street-car, would it be to set apart a certain number of seats in the dress-circle of every theatre, and in the grand-stand of every baseball park, for Negro patrons. The reason why this is not done is perfectly obvious: it would be intolerable to the average Southern man or woman to sit through the hours of a theatrical performance or a baseball game on terms of equal accommodation with Negroes, even with a screen between. Negroes would look out of place, out of status, in the dress circle or the grand-stand; their place, signifying their status, is the peanut-gallery, or the bleachers. There, neither they nor others will be tempted to forget that as things are they must continue.

How shall we account for the "intense feeling" (to quote the language of the mayor or New Orleans) occasioned in that city one day, last July, when it was flashed over the wires that the first prize in the National Spelling Contest had been won by a Negro girl, in competition with white children from New Orleans and other Southern cities? The indignation of at least one of the leading New Orleans papers verged upon hysterics; the editor's rhetoric visited upon some foulest crime could hardly have been more inflamed than in denunciation of the fact that, on the far-away shore of Lake Erie, New Orleans white children had competed at a spelling bee with a Negro girl. The superintendent of the New Orleans schools was roundly denounced in many quarters for permitting his wards to compete with a Negro; and there were broad hints in "Letters from the People" to the papers that his resignation was in order.

Certainly in the days following the National Spelling Contest the race problem was in evidence, if it ever was, in New Orleans and the South! Did it show itself, then, as the problem of Negro crime, or brutality, or laziness? Assuredly not! Of the Negro's personal repulsiveness? By no means! There was no evidence of Negro criminality, or brutality, or laziness in the Negro child's victory; and every day in the South, in their games and otherwise, hundreds of white children of the best families are in closer personal contact with little Negroes than were the white children who took part in the Cleveland spelling bee. The "intense feeling" can be explained

on one ground only: the Negro girl's victory was an affront to the tradition of the Negro's inferiority; it suggested--perhaps indicated--that, given equal opportunities, all Negroes are not necessarily the intellectual inferiors of all white people. What other explanation is rationally conceivable? If the race problem means in the South to its white inhabitants the burden and tragedy of having to dwell face to face with an intellectually and morally backward people, why should not the Negro girl's triumph have occasioned intense feeling of pleasure, rather than displeasure, by its suggestion that her race is not intellectually hopeless?

Consider further that while no Negro, no matter what his occupation, or personal refinement, or intellectual culture, or moral character, is allowed to travel in a Pullman car between state lines, or to enter as a guest a hotel patronized by white people, the blackest of Negro nurses and valets are given food and shelter in all first-class hotels, and occasion neither disgust, nor surprise in the Pullman cars. Here again the heart of the race problem is laid bare. The black nurse with a white baby in her arms, the black valet looking after the comfort of a white invalid, have the label of their inferiority conspicuously upon them; they understand themselves, and everybody understands them, to be servants, enjoying certain privileges for the sake of the person served. Almost anything, the Negro may do in the South, and anywhere he may go, provided the manner of his doing and his doing is that of an inferior. Such is the premium put upon his inferiority; such his inducement to maintain it.

The point here insisted on may be made clearer, if already it is not clear enough, by this consideration, that the man who would lose social caste for dining with an Irish street-sweeper might be congratulated for dining with an Irish educator; but President Roosevelt would scarcely have given greater offense by entertaining a Negro laborer at the White House than he gave by inviting to lunch there the Principal of Tuskegee Institute. The race problem being what it is, the status of any Negro is logically the status of every other. There are recognizable degrees of inferiority among Negroes themselves; some are vastly superior to others. But there is only one degree of inferiority separating the Negro from the white person, attached to all Negroes alike. The logic of the situation requires that to be any sort of black man is to be inferior to any sort of white man; and from this logic there is no departure in the South.

Inconsistent, perhaps, with what has been said may seem the defeat in the Louisiana Legislature (1908) of the anti-miscegenation bill, a measure designed to prohibit sexual cohabitation between white persons and Negroes; to be specific, between white men and Negro women. But there was no inconsistency whatever in the defeat of that bill. In all times and places, the status of that portion of the female population, Lecky's martyred "priestesses of humanity," whose existence men have demanded for the gratification of unlawful passion, has been that of social outcasts. They have no rights that they can insist upon; they are simply privileged to exist by society's permission, and may be any moment legislated out of their vocation. Hence the defeat of an anti-miscegenation measure by Southern legislators cannot be construed as a failure on their part to live up to their conviction of race-superiority. It must be construed, rather, as legislative unwillingness to restrict the white man's liberty; to dictate by statute the kind of social outcast which he may use as a mere means to the gratification of his passion. To concede to Negro women the status of a degraded and proscribed class, is not in any sense to overlook or obscure their racial inferiority, but on the contrary, it may be, to emphasize it. Precisely the same principle, in a word, compasses the defeat of an anti-miscegenation bill which would compass the defeat of a measure to prohibit Negro servants from occupying seats in Pullman cars.

At the risk of reiteration, I must in concluding this article take sharp issue with the view of a recent very able writer, who asks the question, "What, essentially, is the Race Problem?" and answers it thus: "The race problem is the problem of living with human beings who are not like us, whether they are in our estimation our 'superiors' or inferiors, whether they have kinky hair or pigtails, whether they are slant-eyed, hook-nosed, or thick-lipped. In its essence, it is the same problem, magnified, which besets every neighborhood, even every family."

I have contended so far, and I here repeat, that the race problem is essentially NOT what this writer declares it to be. It is emphatically not, in the South, "the problem of living with human beings who are not like us, whether they are in our estimation our superiors or inferiors." It may be, it probably is, that in the North, where the Negro is largely a stranger, a foreigner, very much to the same degree that the Chinese are strangers and foreigners in the South; and where, consequently, the Negro's personal repulsiveness is a much more significant force than it is in the South. Assuredly there would be no race problem, anywhere, were there no contact with others unlike ourselves! The unlikeness of the unlike is everywhere its indispensable foundation. But we get nowhither unless we carefully distinguish between the foundation of the problem and the problem itself. There is nothing in the unlikeness of the unlike that is necessarily problematical; it may be simply accepted and dealt with as a fact, like any other fact. The problem arises only when the people of one race are minded to adopt and act upon some policy more or less oppressive or repressive in dealing with the people of another race. In the absence of some such policy, there has never been a race problem since the world began. It is the existence of such a policy become traditional, and supported by immovable conviction, which

constitutes the race problem of the Southern states.

There was an immensely tragic race problem distressing the South fifty years ago; but who will suggest that it was the problem of "living with human beings who are not like us?" The problem then was, clearly, how to make good a certain conviction concerning the unlike, how to maintain a certain policy in dealing with them. What else is it today? The problem, How to maintain the institution of chattel slavery, ceased to be at Appomattox; the problem, How to maintain the social, industrial, and civic inferiority of the descendants of chattel slaves, succeeded it, and is the race problem of the South at the present time. There is no other.

Whether the policy adopted by the white South, and supported, as I have said, by immovable conviction, is expedient or inexpedient, wise or unwise, righteous or unrighteous, these are questions which I have not sought to answer one way or another in this article. Perhaps they cannot be answered at all in our time. Certain is it, that their only real and satisfactory answer will be many years ahead of the present generation.

In the mean time, nothing could be more unwarranted, than to suppose that the race problem of one section of this country is peculiar to that section, because its white inhabitants are themselves in some sense peculiar; because they are peculiarly prejudiced, because they are peculiarly behind the hour which the high clock of civilization has struck. Remove the white inhabitants of the South, give their place to the white people of any other section of the United States, and, beyond a peradventure, the Southern race problem, as I have defined it, would continue to be--revealed, perhaps, in ways more perplexing, more intense and tragic.

NEGRO SUFFRAGE IN A DEMOCRACY by Ray Stannard Baker

In this paper I endeavor to lay down the fundamental principles which should govern the Negro franchise in a democracy, and to outline a practical programme for the immediate treatment of the problem.

As I see it, the question of Negro suffrage in the United States presents two distinct aspects:--

FIRST: the legal aspect.

SECOND: the practical aspect.

It will be admitted, I think, without argument, that all governments do and of a necessity must exercise the right to limit the number of people who are permitted to take part in the weighty responsibilities of the suffrage. Some governments allow only a few men to vote; in an absolute monarchy there is only one voter; other governments, as they become more democratic, permit a larger proportion of the people to vote.

Our own government is one of the freest in the world in the matter of suffrage; and yet we bar out, in most states, all women; we bar out Mongolians, no matter how intelligent; we bar out Indians, and all foreigners who have not passed through a certain probationary stage and have not acquired a certain small amount of education. We also declare--for an arbitrary limit must be placed somewhere--that no person under twenty-one years of age may exercise the right to vote, although some boys of eighteen are to-day better equipped to pass intelligently upon public questions than many grown men. We even place adult white men on probation until they have resided for a certain length of time, often as much as two years, in the state or the town where they wish to cast their ballots. Our registration and ballot laws eliminate hundreds of thousands of voters; and finally, we bar out everywhere the defective and criminal classes of our population. We do not realize, sometimes, I think, how limited the franchise really is, even in America. We forget that out of nearly ninety million people in the United States, fewer than fifteen million cast their votes for President in 1908--or about one in every six.

Thus the practice of a restricted suffrage is very deeply implanted in our system of government. It is everywhere recognized that even in a democracy lines must be drawn, and that the ballot, the precious instrument of government, must be hedged about with stringent regulations. The question is, where shall these lines be drawn in order that the best interests, not of any particular class, but of the whole nation, shall be served.

Upon this question, we, as free citizens, have the absolute right to agree or disagree with the present laws regulating suffrage; and if we want more people brought in as partakers in government, or some people who are already in, barred out, we have a right to organize, to agitate, to do our best to change the laws. Powerful organizations of women are now agitating for the right to vote; there is an organization which demands the suffrage for Chinese and Japanese who wish to become citizens. It is even

conceivable that a society might be founded to lower the suffrage age-limit from twenty-one to nineteen years, thereby endowing a large number of young men with the privileges, and therefore the educational responsibilities, of political power. On the other hand, a large number of people, chiefly in our Southern States, earnestly believe that the right of the Negro to vote should be curtailed, or even abolished.

Thus we disagree, and government is the resultant of all these diverse views and forces. No one can say dogmatically how far democracy should go in distributing the enormously important powers of active government. Democracy is not a dogma; it is not even a dogma of free suffrage. Democracy is a life, a spirit, a growth. The primal necessity of any sort of government, democracy or otherwise, whether it be more unjust or less unjust toward special groups of its citizens, is to exist, to be a going concern, to maintain upon the whole a stable and peaceful administration of affairs. If a democracy cannot provide such stability, then the people go back to some form of oligarchy. Having secured a fair measure of stability, a democracy proceeds with caution toward the extension of the suffrage to more and more people--trying foreigners, trying women, trying Negroes.

And no one can prophesy how far a democracy will ultimately go in the matter of suffrage. We know only the tendency. We know that in the beginning, even in America, the right to vote was a very limited matter. In the early years, in New England, only church-members voted; then the franchise was extended to include property-owners; then it was enlarged to include all white adults; then to include Negroes; then, in several Western States, to include women.

Thus the line has been constantly advancing, but with many fluctuations, eddies, and back-currents--like any other stream of progress. At the present time the fundamental principles which underlie popular government, and especially the whole matter of popular suffrage, are much in the public mind. The tendency of government throughout the entire civilized world is strongly in the direction of placing more and more power in the hands of the people. In our own country we are enacting a remarkable group of laws providing for direct primaries in the nomination of public officials, for direct election of United States Senators, and for direct legislation by means of the initiative and referendum; and we are even going to the point, in many cities, of permitting the people to recall an elected official who is unsatisfactory. The principle of local option, which is nothing but that of direct government by the people, is being everywhere accepted. All these changes affect, fundamentally, the historic structure of our government, making it less republican and more democratic.

Still more important and far-reaching in its significance is the tendency of our government, especially our Federal Government, to regulate or to appropriate great groups of business enterprises formerly left wholly in private hands. More and more, private business is becoming public business.

Now, then, as the weight of responsibility upon the popular vote is increased, it becomes more and more important that the ballot should be jealously guarded and honestly exercised. In the last few years, therefore, a series of extraordinary new precautions have been adopted: the Australian ballot, more stringent registration systems, the stricter enforcement of naturalization laws to prevent the voting of crowds of unprepared foreigners, and the imposition by several states, rightly or wrongly, of educational and property tests. It becomes a more and more serious matter every year to be an American citizen, more of an honor, more of a duty.

At the close of the Civil War, in a time of intense idealistic emotion, some three-quarters of a million of Negroes, the mass of them densely ignorant and just out of slavery, with the iron of slavery still in their souls, were suddenly given the political rights of free citizens. A great many people, and not in the South alone, thought then, and still think, that it was a mistake to bestow the high powers and privileges of a wholly unrestricted ballot--a ballot which is the symbol of intelligent self-government--upon the Negro. Other people, of whom I am one, believe that it was a necessary concomitant of the revolution; it was itself a revolution, not a growth, and like every other revolution it has had its fearful reaction. Revolutions, indeed, change names, but they do not at once change human relationships. Mankind is reconstructed not by proclamations, or legislation, or military occupation, but by time, growth, education, religion, thought. At that time, then, the nation drove down the stakes of its idealism in government far beyond the point it was able to reach in the humdrum activities of everyday existence. A reaction was inevitable; it was inevitable and perfectly natural that there should be a widespread questioning as to whether all Negroes, or indeed any Negroes, should properly be admitted to full political fellowship. That questioning continues to this day.

Now, the essential principle established by the Fifteenth Amendment to the Constitution was not that all Negroes should necessarily be given an unrestricted access to the ballot; but that the right to vote should not be denied or abridged 'on account of race, color, or previous condition of servitude.' This amendment wiped out the color-line in politics so far as any written law could possibly do it.

Let me here express my profound conviction that the principle of political equality then laid down is a sound, valid, and absolutely essential principle in any free government; that restrictions upon the ballot, when necessary, should be made to apply equally to white and colored citizens; and that the Fifteenth Amendment ought not to be, and cannot be repealed. Moreover, I am convinced that the principle of political equality is more firmly established to-day in this country than it was forty years ago, when it had only Northern bayonets behind it. For now, however short the practice falls of reaching the legal standard, the principle is woven into the warp and woof of Southern life and Southern legislation. Many Southern white leaders of thought are to-day CONVINCED, not FORCED believers in the principle; and that is a great omen.

Limitations have come about, it is true, and were to be expected as the back-currents of the revolution. Laws providing for educational and property qualifications as a prerequisite to the exercise of the suffrage have been passed in all the Southern States, and have operated to exclude from the ballot large numbers of both white and colored citizens, who on account of ignorance or poverty are unable to meet the tests. These provisions, whatever the opinion entertained as to the wisdom of such laws, are well within the principle laid down by the Fifteenth Amendment. But several Southern States have gone a step further, and by means of the so-called 'grandfather laws,' have exempted certain ignorant white men from the necessity of meeting the educational and property tests. These unfair 'grandfather laws,' however, in some of the states adopting them, have now expired by limitation.

Let me then lay down this general proposition:--

Nowhere in the South to-day is the Negro cut off LEGALLY, as a Negro, from the ballot. Legally, to-day, any Negro who can meet the comparatively slight requirements as to education, or property, or both, can cast his ballot on a basis of equality with the white man. I have emphasized the word legally, for I know the PRACTICAL difficulties which confront the Negro votes in many parts of the South. The point I wish to make is that legally the Negro is essentially the political equal of the white man; but that practically, in the enforcement of the law, the legislative ideal is still pegged out far beyond the actual performance.

Now, then, if we are interested in the problem of democracy, we have two courses open to us. We may think the laws are unjust to the Negro, and incidentally to the 'poor white' man as well. If we do, we have a perfect right to agitate for changes; and we can do much to disclose, without heat, the actual facts regarding the complicated and vexatious legislative situation in the South, as regards the suffrage. Every change in the legislation upon this subject should, indeed, be jealously watched, that the principle of political equality between the races be not legally curtailed. The doctrine laid down in the Fifteenth Amendment must, at any hazard, be maintained.

But, personally,--and I am here voicing a profound conviction,--I think our emphasis at present should be laid upon the practical rather than upon the legal aspect of the problem; I think we should take advantage of the widely prevalent feeling in the South that the question of suffrage has been settled, legally, for some time to come: of the desire on the part of many Southern people, both white and colored, to turn aside from the discussion of the political status of the Negro.

In short, let us for the time being accept the laws as they are, and build upward from that point. Let us turn our attention to the practical task of finding out why it is that the laws we already have are not enforced, and how best to secure an honest vote for every Negro and equally for every 'poor white' man, who is able to meet the requirements, but who for one reason or another does not or cannot now exercise his rights. I include the disfranchised white man as well as the Negro, because I take it that we are interested, first of all, in democracy, and unless we can arouse the spirit of democracy, South and North, we can hope for justice neither for Negroes, nor for the poorer class of white men, nor for the women of the factories and shops, nor for the children of the cottonmills.

Taking up this side of the problem we shall discover two entirely distinct difficulties:--

First, we shall find many Negroes, and indeed hundreds of thousands of white men as well, who might vote, but who, through ignorance, or inability or unwillingness to pay the poll-taxes, or from mere lack of interest, disfranchise themselves.

The second difficulty is peculiar to the Negro. It consists in open or concealed intimidation on the part of the white men who control the election machinery. In many places in the South to-day no Negro, how well qualified, would dare to present himself for registration; when he does, he is rejected for some trivial or illegal reason.

Thus we have to meet a vast amount of apathy and ignorance and poverty on the one hand, and the threat of intimidation on the other.

First of all, for it is the chief injustice as between white and colored men with which we have to deal,--an injustice which the law already makes illegal and punishable,--how shall we meet the matter of intimidation? As I have already said, the door of the suffrage is everywhere legally open to the Negro, but a certain sort of Southerner bars the passage-way. He stands there and, law or no law, keeps out many Negroes who might vote; and he represents in most parts of the South the prevailing public opinion.

Shall we meet this situation by force? What force is available? Shall the North go down and fight the South? You and I know that the North to-day has no feeling but friendship for the South. More than that--and I say it with all seriousness, because it represents what I have heard wherever I have gone in the North to make inquiries regarding the Negro problem--the North, wrongly or rightly, is to-day more than half convinced that the South is right in imposing some measure of limitation upon the franchise. There is now, in short, no disposition anywhere in the North to interfere in internal affairs in the South--not even with the force of public opinion.

What other force, then, is to be invoked? Shall the Negro revolt? Shall he migrate? Shall he prosecute his case in the courts? The very asking of these questions suggests the inevitable reply.

We might as well, here and now, dismiss the idea of force, express or implied. There are times of last resort which call for force; but this is not such a time.

What other alternatives are there?

Accepting the laws as they are, then, there are two methods of procedure, neither sensational nor exciting. I have no quick cure to suggest, but only old and tried methods of commonplace growth.

The underlying causes of the trouble in the country being plainly ignorance and prejudice, we must meet ignorance and prejudice with their antidotes, education and association.

Every effort should be made to extend free education among both Negroes and white people. A great extension of education is now going forward in the South. The Negro is not by any means getting his full share; but, as certainly as sunshine makes things grow, education in the South will produce tolerance. That there is already such a growing tolerance no one who has talked with the leading white men in the South can doubt. The old fire-eating, Negro-baiting leaders of the Tillman-Vardaman type are swiftly passing away: a far better and broader group is coming into power.

In his last book, Mr. Edgar Gardner Murphy, of Alabama, expresses this new point of view when he says,--

'There is no question here as to the unrestricted admission [to the ballot] of the great masses of our ignorant and semi-ignorant blacks. I know no advocate of such admission. But the question is as to whether the individuals of the race, upon conditions or restrictions legally imposed and fairly administered, shall be admitted to adequate and increasing representation in the electorate. And as that question is more seriously and more generally considered, many of the leading publicists of the South, I am glad to say, are quietly resolved that the answer shall be in the affirmative.'

From an able Southern white man, a resident of New Orleans, I received recently a letter containing these words:--

'I believe we have reached the bottom, and a sort of quiescent period. I think it most likely that from now on there will be a gradual increase of the Negro vote. And I honestly believe that the less said about it, the surer the increase will be.'

Education--and by education I mean education of all sorts, industrial, professional, classical, in accordance with each man's talents--will not only produce breadth and tolerance, but will help to cure the apathy which now keeps so many thousands of both white men and Negroes from the polls: for it will show them that it is necessary for every man to exercise all the political rights within his reach. If he fails voluntarily to take advantage of the rights he already has, how shall he acquire more rights?

And as ignorance must be met by education, so prejudice must be met with its antidote, which is association. Democracy does not consist in mere voting, but in association, the spirit of common effort, of which the ballot is a mere visible expression. When we come to know one another we soon find that the points of likeness are much more numerous than the points of difference. And this human association for the common good, which is democracy, is difficult to bring about anywhere, whether among different classes of white people, or between white people and Negroes. As one of the leaders of the Negro race, Dr. Du Bois, has said,--

'Herein lies the tragedy of the age. Not that men are poor: all men know something of poverty. Not that men are wicked: who is good? Not that men are ignorant: what is truth? Nay, but that men know so little of each other.'

After the Atlanta riot I attended a number of conferences between leading white men and leading colored men. It is true those meetings bore evidence of awkwardness and embarrassment, for they were among the first of the sort to take place in the South, but they were none the less valuable. A white man told me after one of the meetings,--

'I did not know that there were any such sensible Negroes in the South.'

And a Negro told me that it was the first time in his life that he had ever heard a Southern white man reason in a friendly way with a Negro concerning their common difficulties.

More and more these associations of white and colored men, at certain points of contact, must and will come about. Already, in connection with various educational and business projects in the South, white and colored men meet on common grounds, and the way has been opened to a wider mutual understanding. And it is common enough now, where it was unheard of a few years ago, for both white men and Negroes to speak from the same platform in the South. I have attended a number of such meetings. Thus slowly--awkwardly, at first, for two centuries of prejudice are not immediately overcome--the white man and Negro will come to know one another, not merely as master and servant, but as co-workers. These things cannot be forced.

One reason why the white man and the Negro have not got together more rapidly in the South than they have, is because they have tried always to meet at the sorest points. When sensible people, who must live together whether or no, find that there are points at which they cannot agree, it is the part of wisdom to avoid these points, and to meet upon other and common interests. Upon no other terms, indeed, can a democracy exist, for in no imaginable future state will individuals cease to disagree with one another upon something less than half of all the problems of life.

'Here we all live together in a great country,' say the apostles of this view; 'let us all get together and develop it. Let the Negro do his best to educate himself, to own his own land, and to buy and sell with the white people in the fairest possible way.'

It is wonderful, indeed, how close together men who are stooping to a common task soon come.

Now, buying and selling, land ownership and common material pursuits, may not be the highest points of contact between man and man, but they are real points, and help to give men an idea of the worth of their fellows, white or black. How many times, in the South, I heard white men speak in high admiration of some Negro farmer who had been successful, or of some Negro blacksmith who was a worthy citizen, or of some Negro doctor who was a leader of his race.

It is curious, once a man (any man, white or black) learns to do his job well, how he finds himself in a democratic relationship with other men. I remember asking a prominent white citizen of a town in Central Georgia if he knew anything about Tuskegee. He said,--

'Yes: I had rather a curious experience last fall. I was building a hotel and couldn't get any one to do the plastering as I wanted it done. One day I saw two Negro plasterers at work in a new house that a friend of mine was building. I watched them for an hour. They seemed to know their trade. I invited them to come over and see me. They came, took the contract for my work, hired a white man to carry mortar at a dollar a day, and when they got through it was the best job of plastering in town. I found that they had learned their trade at Tuskegee. They averaged four dollars a day each in wages. We tried to get them to locate in our town, but they went back to school.'

When I was in Mississippi a prominent banker showed me his business letter-heads.

'Good job, isn't it?' he said. 'A Negro printer did it. He wrote to me asking if he might bid on my work. I replied that although I had known him a long time I couldn't give him the job merely because he was a Negro. He told me to forget his color, and said that if he couldn't do as good a job and do it as reasonably as any white man could, he didn't want it. I let him try, and now he does most of our printing.'

Out of such points of contact, then, encouraged by such wise leaders as Booker T. Washington, will grow an ever finer and finer spirit of association and of common and friendly knowledge. And that will inevitably lead to an extension upon the soundest possible basis of the Negro franchise. I know cases where white men have urged intelligent Negroes to come and cast their ballots, and have stood sponsor for them, out of genuine respect. As a result, to-day, the Negroes who vote in the South are, as a class, men of substance and intelligence, fully equal to the tasks of citizenship.

Thus, I have boundless confidence not only in the sense of the white men of the South, but in the innate capability of the Negro, and that once these two come really to know each other, not at sore points of contact, but as common workers for a common country, the question of suffrage will gradually solve itself along the lines of true democracy.

Another influence also will tend to change the status of the Negro as a voter. That is the pending break-up of the political solidarity of the South. All the signs point to a political realignment upon new issues in this country, both South and North. Old party names may even pass away. And that break-up, with the attendant struggle for votes, is certain to bring into politics thousands of Negroes and white men now disfranchised. The result of a real division on live issues has been shown in many local contests in the South, as in the fight against the saloons, when every qualified Negro voter, and every Negro who could qualify, was eagerly pushed forward by one side or the other. With such a division on new issues the Negro will tend to exercise more and more political power, dividing, not on the color line, but on the principles at stake.

Thus in spite of the difficulties which now confront the Negro, I cannot but look upon the situation in a spirit of optimism. I think sometimes we are tempted to set a higher value upon the ritual of a belief than upon the spirit which underlies it. The ballot is not democracy: it is merely the symbol or ritual of democracy, and it may be full of passionate social, yes, even religious significance, or it may be a mere empty and dangerous formalism. What we should look to, then, primarily, is not the shadow, but the substance of democracy in this country. Nor must we look for results too swiftly; our progress toward democracy is slow of growth and needs to be cultivated with patience and watered with faith.

FOOTNOTES

MY BONDAGE and MY FREEDOM

EDITOR'S PREFACE

If the volume now presented to the public were a mere work of ART, the history of its misfortune might be written in two very simple words—TOO LATE. The nature and character of slavery have been subjects of an almost endless variety of artistic representation;

and after the brilliant achievements in that field, and while those achievements are yet fresh in the memory of the million, he who would add another to the legion, must possess the charm of transcendent excellence, or apologize for something worse than rashness. The reader is, therefore, assured, with all due promptitude, that his attention is not invited to a work of ART, but to a work of FACTS—Facts, terrible and almost incredible, it may be yet FACTS, nevertheless.

I am authorized to say that there is not a fictitious name nor place in the whole volume; but that names and places are literally given, and that every transaction therein described actually transpired.

Perhaps the best Preface to this volume is furnished in the following letter of Mr. Douglass, written in answer to my urgent solicitation for such a work:

ROCHESTER, N. Y. _July_ 2, 1855.

DEAR FRIEND: I have long entertained, as you very well know, a somewhat positive repugnance to writing or speaking anything for the public, which could, with any degree of plausibilty, make me liable to the imputation of seeking personal notoriety, for its own sake. Entertaining that feeling very sincerely, and permitting its control, perhaps, quite unreasonably, I have often refused to narrate my personal experience in public anti-slavery meetings, and in sympathizing circles, when urged to do so by friends, with whose views and wishes, ordinarily, it were a pleasure to comply. In my letters and speeches, I have generally aimed to discuss the question of Slavery in the light of fundamental principles, and upon facts, notorious and open to all; making, I trust, no more of the fact of my own former enslavement, than circumstances seemed absolutely to require. I have never placed my opposition to slavery on a basis so narrow as my own enslavement, but rather upon the indestructible and unchangeable laws of human nature, every one of which is perpetually and flagrantly violated by the slave system. I have also felt that it was best for those having histories worth the writing—or supposed to be so—to commit such work to hands other than their own. To write of one's self, in such a manner as not to incur the imputation of weakness, vanity, and egotism, is a work within the ability of but few; and I have little reason to believe that I belong to that fortunate few.

These considerations caused me to hesitate, when first you kindly urged me to prepare for publication a full account of my life as a slave, and my life as a freeman.

Nevertheless, I see, with you, many reasons for regarding my autobiography as exceptional in its character, and as being, in some sense, naturally beyond the reach of those reproaches which honorable and sensitive minds dislike to incur. It is not to illustrate any heroic achievements of a man, but to vindicate a just and beneficent principle, in its application to the whole human family, by letting in the light of truth upon a system, esteemed by some as a blessing, and by others as a curse and a crime. I agree with you, that this system is now at the bar of public opinion—not only of this country, but of the whole civilized world—for judgment. Its friends have made for it the usual plea—"not guilty;" the case must, therefore, proceed. Any facts, either from slaves, slaveholders, or by-standers, calculated to enlighten the public mind, by revealing the true nature, character, and tendency of the slave system, are in order, and can scarcely be innocently withheld.

I see, too, that there are special reasons why I should write my own biography, in preference to employing another to do it. Not only is slavery on trial, but unfortunately, the enslaved people are also on trial. It is alleged, that they are, naturally, inferior; that they are _so low_ in the scale of humanity, and so utterly stupid, that they are unconscious of their wrongs, and do not apprehend their rights. Looking, then, at your request, from this stand-point, and wishing everything of which you think me capable to go to the benefit of my afflicted people, I part with my doubts and hesitation, and proceed to furnish you the desired manuscript; hoping that you may be able to make such arrangements for its publication as shall be best adapted to accomplish that good which you so enthusiastically anticipate.

FREDERICK DOUGLASS

There was little necessity for doubt and hesitation on the part of Mr. Douglass, as to the propriety of his giving to the world a full account of himself. A man who was born and brought up in slavery, a living witness of its horrors; who often himself experienced its cruelties; and who, despite the depressing influences surrounding his birth, youth and manhood, has risen, from a dark and almost absolute obscurity, to the distinguished position which he now occupies, might very well assume the existence of a commendable curiosity, on the part of the public, to know the facts of his remarkable history.

EDITOR

INTRODUCTION

When a man raises himself from the lowest condition in society to the highest, mankind pay him the tribute of their admiration; when he accomplishes this elevation by native energy, guided by prudence and wisdom, their admiration is increased; but when his course, onward and upward, excellent in itself, furthermore proves a possible, what had hitherto been regarded as an impossible, reform, then he becomes a burning and a shining light, on which the aged may look with gladness, the young with hope, and the down-trodden, as a representative of what they may themselves become. To such a man, dear reader, it is my privilege to introduce you.

The life of Frederick Douglass, recorded in the pages which follow, is not merely an example of self-elevation under the most adverse circumstances; it is, moreover, a noble vindication of the highest aims of the American anti-slavery movement. The real object of that movement is not only to disenthrall, it is, also, to bestow upon the Negro the exercise of all those rights, from the possession of which he has been so long debarred.

But this full recognition of the colored man to the right, and the entire admission of the same to the full privileges, political, religious and social, of manhood, requires powerful effort on the part of the enthralled, as well as on the part of those who would disenthrall them. The people at large must feel the conviction, as well as admit the abstract logic, of human equality; the Negro, for the first time in the world's history, brought in full contact with high civilization, must prove his title first to all that is demanded for him; in the teeth of unequal chances, he must prove himself equal to the mass of those who oppress him—therefore, absolutely superior to his apparent fate, and to their relative ability. And it is most cheering to the friends of freedom, today, that evidence of this equality is rapidly accumulating, not from the ranks of the half-freed colored people of the free states, but from the very depths of slavery itself; the indestructible equality of man to man is demonstrated by the ease with which black men, scarce one remove from barbarism—if slavery can be honored with such a distinction—vault into the high places of the most advanced and painfully acquired civilization. Ward and Garnett, Wells Brown and Pennington, Loguen and Douglass, are banners on the outer wall, under which abolition is fighting its most successful battles, because they are living exemplars of the practicability of the most radical abolitionism; for, they were all of them born to the doom of slavery, some of them remained slaves until adult age, yet they all have not only won equality to their white fellow citizens, in civil, religious, political and social rank, but they have also illustrated and adorned our common country by their genius, learning and eloquence.

The characteristics whereby Mr. Douglass has won first rank among these remarkable men, and is still rising toward highest rank among living Americans, are abundantly laid bare in the book before us. Like the autobiography of Hugh Miller, it carries us so far back into early childhood, as to throw light upon the question, "when positive and persistent memory begins in the human being." And, like Hugh Miller, he must have been a shy old-fashioned child, occasionally oppressed by what he could not well account for, peering and poking about among the layers of right and wrong, of tyrant and thrall, and the wonderfulness of that hopeless tide of things which brought power to one race, and unrequited toil to another, until, finally, he stumbled upon his "first-found Ammonite," hidden away down in the depths of his own nature, and which revealed to him the fact that liberty and right, for all men, were anterior to slavery and wrong. When his knowledge of the world was bounded by the visible horizon on Col. Lloyd's plantation, and while every thing around him bore a fixed, iron stamp, as if it had always been so, this was, for one so young, a notable discovery.

To his uncommon memory, then, we must add a keen and accurate insight into men and things; an original breadth of common sense which enabled him to see, and weigh, and compare whatever passed before him, and which kindled a desire to search out and define their relations to other things not so patent, but which never succumbed to the marvelous nor the supernatural; a sacred thirst for liberty and for learning, first as a means of attaining liberty, then as an end in itself most desirable; a will; an unfaltering energy and determination to obtain what his soul pronounced desirable; a majestic self-hood; determined courage; a deep and agonizing sympathy with his embruted, crushed and bleeding fellow slaves, and an extraordinary depth of passion, together with that rare alliance between passion and intellect, which enables the former, when deeply roused, to excite, develop and sustain the latter.

With these original gifts in view, let us look at his schooling; the fearful discipline through which it pleased God to prepare him for the high calling on which he has since entered—the advocacy of emancipation by the people who are not slaves. And for this special mission, his plantation education was better than any he could have acquired in any lettered school. What he needed, was facts and experiences, welded to acutely wrought up sympathies, and these he could not elsewhere have obtained, in a manner so peculiarly adapted to his nature. His physical being was well trained, also, running wild until advanced into boyhood; hard work and light diet, thereafter, and a skill in handicraft in youth.

For his special mission, then, this was, considered in connection with his natural gifts, a good schooling; and, for his special mission, he doubtless “left school” just at the proper moment. Had he remained longer in slavery—had he fretted under bonds until the ripening of manhood and its passions, until the drear agony of slave-wife and slave-children had been piled upon his already bitter experiences—then, not only would his own history have had another termination, but the drama of American slavery would have been essentially varied; for I cannot resist the belief, that the boy who learned to read and write as he did, who taught his fellow slaves these precious acquirements as he did, who plotted for their mutual escape as he did, would, when a man at bay, strike a blow which would make slavery reel and stagger. Furthermore, blows and insults he bore, at the moment, without resentment; deep but suppressed emotion rendered him insensible to their sting; but it was afterward, when the memory of them went seething through his brain, breeding a fiery indignation at his injured self-hood, that the resolve came to resist, and the time fixed when to resist, and the plot laid, how to resist; and he always kept his self-pledged word. In what he undertook, in this line, he looked fate in the face, and had a cool, keen look at the relation of means to ends. Henry Bibb, to avoid chastisement, strewed his master’s bed with charmed leaves and _was whipped_. Frederick Douglass quietly pocketed a like _fetiche_, compared his muscles with those of Covey—and _whipped him_.

In the history of his life in bondage, we find, well developed, that inherent and continuous energy of character which will ever render him distinguished. What his hand found to do, he did with his might; even while conscious that he was wronged out of his daily earnings, he worked, and worked hard. At his daily labor he went with a will; with keen, well set eye, brawny chest, lithe figure, and fair sweep of arm, he would have been king among calkers, had that been his mission.

It must not be overlooked, in this glance at his education, that Mr. Douglass lacked one aid to which so many men of mark have been deeply indebted—he had neither a mother’s care, nor a mother’s culture, save that which slavery grudgingly meted out to him. Bitter nurse! may not even her features relax with human feeling, when she gazes at such offspring! How susceptible he was to the kindly influences of mother-culture, may be gathered from his own words, on page 57: “It has been a life-long standing grief to me, that I know so little of my mother, and that I was so early separated from her. The counsels of her love must have been beneficial to me. The side view of her face is imaged on my memory, and I take few steps in life, without feeling her presence; but the image is mute, and I have no striking words of hers treasured up.”

From the depths of chattel slavery in Maryland, our author escaped into the caste-slavery of the north, in New Bedford, Massachusetts. Here he found oppression assuming another, and hardly less bitter, form; of that very handicraft which the greed of slavery had taught him, his half-freedom denied him the exercise for an honest living; he found himself one of a class—free colored men—whose position he has described in the following words:

“Aliens are we in our native land. The fundamental principles of the republic, to which the humblest white man, whether born here or elsewhere, may appeal with confidence, in the hope of awakening a favorable response, are held to be inapplicable to us. The glorious doctrines of your revolutionary fathers, and the more glorious teachings of the Son of God, are construed and applied against us. We are literally scourged beyond the beneficent range of both authorities, human and divine. * * * * American humanity hates us, scorns us, disowns and denies, in a thousand ways, our very personality. The outspread wing of American christianity, apparently broad enough to give shelter to a perishing world, refuses to cover us. To us, its bones are brass, and its features iron. In running thither for shelter and succor, we have only fled from the hungry blood-hound to the devouring wolf—from a corrupt and selfish world, to a hollow and hypocritical church.”—_Speech before American and Foreign Anti-Slavery Society, May_, 1854.

Four years or more, from 1837 to 1841, he struggled on, in New Bedford, sawing wood, rolling casks, or doing what labor he might, to support himself and young family; four years he brooded over the scars which slavery and semi-slavery had inflicted upon his body and soul; and then, with his wounds yet unhealed, he fell among the Garrisonians—a glorious waif to those most ardent reformers. It happened one day, at Nantucket, that he, diffidently and reluctantly, was led to address an anti-slavery meeting. He was about the age when the younger Pitt entered the House of Commons; like Pitt, too, he stood up a born orator.

William Lloyd Garrison, who was happily present, writes thus of Mr. Douglass’ maiden effort; “I shall never forget his first speech at the convention—the extraordinary emotion it excited in my own mind—the powerful impression it created upon a crowded auditory, completely taken by surprise. * * * I think I never hated slavery so intensely as at that moment; certainly, my perception of the enormous outrage which is inflicted by it on the godlike nature of its victims, was rendered far more clear than ever. There stood one in physical proportions and stature commanding and exact—in intellect richly endowed—in natural eloquence a prodigy.” 1

It is of interest to compare Mr. Douglass's account of this meeting with Mr. Garrison's. Of the two, I think the latter the most correct. It must have been a grand burst of eloquence! The pent up agony, indignation and pathos of an abused and harrowed boyhood and youth, bursting out in all their freshness and overwhelming earnestness!

This unique introduction to its great leader, led immediately to the employment of Mr. Douglass as an agent by the American Anti-Slavery Society. So far as his self-relying and independent character would permit, he became, after the strictest sect, a Garrisonian. It is not too much to say, that he formed a complement which they needed, and they were a complement equally necessary to his "make-up." With his deep and keen sensitiveness to wrong, and his wonderful memory, he came from the land of bondage full of its woes and its evils, and painting them in characters of living light; and, on his part, he found, told out in sound Saxon phrase, all those principles of justice and right and liberty, which had dimly brooded over the dreams of his youth, seeking definite forms and verbal expression. It must have been an electric flashing of thought, and a knitting of soul, granted to but few in this life, and will be a life-long memory to those who participated in it. In the society, moreover, of Wendell Phillips, Edmund Quincy, William Lloyd Garrison, and other men of earnest faith and refined culture, Mr. Douglass enjoyed the high advantage of their assistance and counsel in the labor of self-culture, to which he now addressed himself with wonted energy. Yet, these gentlemen, although proud of Frederick Douglass, failed to fathom, and bring out to the light of day, the highest qualities of his mind; the force of their own education stood in their own way: they did not delve into the mind of a colored man for capacities which the pride of race led them to believe to be restricted to their own Saxon blood. Bitter and vindictive sarcasm, irresistible mimicry, and a pathetic narrative of his own experiences of slavery, were the intellectual manifestations which they encouraged him to exhibit on the platform or in the lecture desk.

A visit to England, in 1845, threw Mr. Douglass among men and women of earnest souls and high culture, and who, moreover, had never drank of the bitter waters of American caste. For the first time in his life, he breathed an atmosphere congenial to the longings of his spirit, and felt his manhood free and unrestricted. The cordial and manly greetings of the British and Irish audiences in public, and the refinement and elegance of the social circles in which he mingled, not only as an equal, but as a recognized man of genius, were, doubtless, genial and pleasant resting places in his hitherto thorny and troubled journey through life. There are joys on the earth, and, to the wayfaring fugitive from American slavery or American caste, this is one of them.

But his sojourn in England was more than a joy to Mr. Douglass. Like the platform at Nantucket, it awakened him to the consciousness of new powers that lay in him. From the pupilage of Garrisonism he rose to the dignity of a teacher and a thinker; his opinions on the broader aspects of the great American question were earnestly and incessantly sought, from various points of view, and he must, perforce, bestir himself to give suitable answer. With that prompt and truthful perception which has led their sisters in all ages of the world to gather at the feet and support the hands of reformers, the gentlewomen of England 2 were foremost to encourage and strengthen him to carve out for himself a path fitted to his powers and energies, in the life-battle against slavery and caste to which he was pledged. And one stirring thought, inseparable from the British idea of the evangel of freedom, must have smote his ear from every side—

Hereditary bondmen! know ye not Who would be free, themselves mast strike the blow?

The result of this visit was, that on his return to the United States, he established a newspaper. This proceeding was sorely against the wishes and the advice of the leaders of the American Anti-Slavery Society, but our author had fully grown up to the conviction of a truth which they had once promulged, but now forgotten, to wit: that in their own elevation—self-elevation—colored men have a blow to strike "on their own hook," against slavery and caste. Differing from his Boston friends in this matter, diffident in his own abilities, reluctant at their dissuadings, how beautiful is the loyalty with which he still clung to their principles in all things else, and even in this.

Now came the trial hour. Without cordial support from any large body of men or party on this side the Atlantic, and too far distant in space and immediate interest to expect much more, after the much already done, on the other side, he stood up, almost alone, to the arduous labor and heavy expenditure of editor and lecturer. The Garrison party, to which he still adhered, did not want a _colored_ newspaper—there was an odor of _caste_ about it; the Liberty party could hardly be expected to give warm support to a man who smote their principles as with a hammer; and the wide gulf which separated the free colored people from the Garrisonians, also separated them from their brother, Frederick Douglass.

The arduous nature of his labors, from the date of the establishment of his paper, may be estimated by the fact, that anti-slavery papers in the United States, even while organs of, and when supported by, anti-slavery parties, have, with a single exception, failed

to pay expenses. Mr. Douglass has maintained, and does maintain, his paper without the support of any party, and even in the teeth of the opposition of those from whom he had reason to expect counsel and encouragement. He has been compelled, at one and the same time, and almost constantly, during the past seven years, to contribute matter to its columns as editor, and to raise funds for its support as lecturer. It is within bounds to say, that he has expended twelve thousand dollars of his own hard earned money, in publishing this paper, a larger sum than has been contributed by any one individual for the general advancement of the colored people. There had been many other papers published and edited by colored men, beginning as far back as 1827, when the Rev. Samuel E. Cornish and John B. Russworm (a graduate of Bowdoin college, and afterward Governor of Cape Palmas) published the _Freedom's Journal_, in New York City; probably not less than one hundred newspaper enterprises have been started in the United States, by free colored men, born free, and some of them of liberal education and fair talents for this work; but, one after another, they have fallen through, although, in several instances, anti-slavery friends contributed to their support. 3 It had almost been given up, as an impracticable thing, to maintain a colored newspaper, when Mr. Douglass, with fewest early advantages of all his competitors, essayed, and has proved the thing perfectly practicable, and, moreover, of great public benefit. This paper, in addition to its power in holding up the hands of those to whom it is especially devoted, also affords irrefutable evidence of the justice, safety and practicability of Immediate Emancipation; it further proves the immense loss which slavery inflicts on the land while it dooms such energies as his to the hereditary degradation of slavery.

It has been said in this Introduction, that Mr. Douglass had raised himself by his own efforts to the highest position in society. As a successful editor, in our land, he occupies this position. Our editors rule the land, and he is one of them. As an orator and thinker, his position is equally high, in the opinion of his countrymen. If a stranger in the United States would seek its most distinguished men—the movers of public opinion—he will find their names mentioned, and their movements chronicled, under the head of "BY MAGNETIC TELEGRAPH," in the daily papers. The keen caterers for the public attention, set down, in this column, such men only as have won high mark in the public esteem. During the past winter—1854-5—very frequent mention of Frederick Douglass was made under this head in the daily papers; his name glided as often—this week from Chicago, next week from Boston—over the lightning wires, as the name of any other man, of whatever note. To no man did the people more widely nor more earnestly say, _"Tell me thy thought!"_ And, somehow or other, revolution seemed to follow in his wake. His were not the mere words of eloquence which Kossuth speaks of, that delight the ear and then pass away. No! They were _work_-able, _do_-able words, that brought forth fruits in the revolution in Illinois, and in the passage of the franchise resolutions by the Assembly of New York.

And the secret of his power, what is it? He is a Representative American man—a type of his countrymen. Naturalists tell us that a full grown man is a resultant or representative of all animated nature on this globe; beginning with the early embryo state, then representing the lowest forms of organic life, 4 and passing through every subordinate grade or type, until he reaches the last and highest—manhood. In like manner, and to the fullest extent, has Frederick Douglass passed through every gradation of rank comprised in our national make-up, and bears upon his person and upon his soul every thing that is American. And he has not only full sympathy with every thing American; his proclivity or bent, to active toil and visible progress, are in the strictly national direction, delighting to outstrip "all creation."

Nor have the natural gifts, already named as his, lost anything by his severe training. When unexcited, his mental processes are probably slow, but singularly clear in perception, and wide in vision, the unfailing memory bringing up all the facts in their every aspect; incongruities he lays hold of incontinently, and holds up on the edge of his keen and telling wit. But this wit never descends to frivolity; it is rigidly in the keeping of his truthful common sense, and always used in illustration or proof of some point which could not so readily be reached any other way. "Beware of a Yankee when he is feeding," is a shaft that strikes home in a matter never so laid bare by satire before. "The Garrisonian views of disunion, if carried to a successful issue, would only place the people of the north in the same relation to American slavery which they now bear to the slavery of Cuba or the Brazils," is a statement, in a few words, which contains the result and the evidence of an argument which might cover pages, but could not carry stronger conviction, nor be stated in less pregnable form. In proof of this, I may say, that having been submitted to the attention of the Garrisonians in print, in March, it was repeated before them at their business meeting in May—the platform, _par excellence_, on which they invite free fight, _a l'outrance_, to all comers. It was given out in the clear, ringing tones, wherewith the hall of shields was wont to resound of old, yet neither Garrison, nor Phillips, nor May, nor Remond, nor Foster, nor Burleigh, with his subtle steel of "the ice brook's temper," ventured to break a lance upon it! The doctrine of the dissolution of the Union, as a means for the abolition of American slavery, was silenced upon the lips that gave it birth, and in the presence of an array of defenders who compose the keenest intellects in the land.

“The man who is right is a majority” is an aphorism struck out by Mr. Douglass in that great gathering of the friends of freedom, at Pittsburgh, in 1852, where he towered among the highest, because, with abilities inferior to none, and moved more deeply than any, there was neither policy nor party to trammel the outpourings of his soul. Thus we find, opposed to all disadvantages which a black man in the United States labors and struggles under, is this one vantage ground—when the chance comes, and the audience where he may have a say, he stands forth the freest, most deeply moved and most earnest of all men.

It has been said of Mr. Douglass, that his descriptive and declamatory powers, admitted to be of the very highest order, take precedence of his logical force. Whilst the schools might have trained him to the exhibition of the formulas of deductive logic, nature and circumstances forced him into the exercise of the higher faculties required by induction. The first ninety pages of this “Life in Bondage,” afford specimens of observing, comparing, and careful classifying, of such superior character, that it is difficult to believe them the results of a child’s thinking; he questions the earth, and the children and the slaves around him again and again, and finally looks to _“God in the sky”_ for the why and the wherefore of the unnatural thing, slavery. _“Yes, if indeed thou art, wherefore dost thou suffer us to be slain?”_ is the only prayer and worship of the God-forsaken Dodos in the heart of Africa. Almost the same was his prayer. One of his earliest observations was that white children should know their ages, while the colored children were ignorant of theirs; and the songs of the slaves grated on his inmost soul, because a something told him that harmony in sound, and music of the spirit, could not consociate with miserable degradation.

To such a mind, the ordinary processes of logical deduction are like proving that two and two make four. Mastering the intermediate steps by an intuitive glance, or recurring to them as Ferguson resorted to geometry, it goes down to the deeper relation of things, and brings out what may seem, to some, mere statements, but which are new and brilliant generalizations, each resting on a broad and stable basis. Thus, Chief Justice Marshall gave his decisions, and then told Brother Story to look up the authorities—and they never differed from him. Thus, also, in his “Lecture on the Anti-Slavery Movement,” delivered before the Rochester Ladies’ Anti-Slavery Society, Mr. Douglass presents a mass of thought, which, without any showy display of logic on his part, requires an exercise of the reasoning faculties of the reader to keep pace with him. And his “Claims of the Negro Ethnologically Considered,” is full of new and fresh thoughts on the dawning science of race-history.

If, as has been stated, his intellection is slow, when unexcited, it is most prompt and rapid when he is thoroughly aroused. Memory, logic, wit, sarcasm, invective pathos and bold imagery of rare structural beauty, well up as from a copious fountain, yet each in its proper place, and contributing to form a whole, grand in itself, yet complete in the minutest proportions. It is most difficult to hedge him in a corner, for his positions are taken so deliberately, that it is rare to find a point in them undefended aforethought. Professor Reason tells me the following: “On a recent visit of a public nature, to Philadelphia, and in a meeting composed mostly of his colored brethren, Mr. Douglass proposed a comparison of views in the matters of the relations and duties of ‘our people;’ he holding that prejudice was the result of condition, and could be conquered by the efforts of the degraded themselves. A gentleman present, distinguished for logical acumen and subtlety, and who had devoted no small portion of the last twenty-five years to the study and elucidation of this very question, held the opposite view, that prejudice is innate and unconquerable. He terminated a series of well dove-tailed, Socratic questions to Mr. Douglass, with the following: ‘If the legislature at Harrisburgh should awaken, to-morrow morning, and find each man’s skin turned black and his hair woolly, what could they do to remove prejudice?’ ‘Immediately pass laws entitling black men to all civil, political and social privileges,’ was the instant reply—and the questioning ceased.”

The most remarkable mental phenomenon in Mr. Douglass, is his style in writing and speaking. In March, 1855, he delivered an address in the assembly chamber before the members of the legislature of the state of New York. An eye witness 5 describes the crowded and most intelligent audience, and their rapt attention to the speaker, as the grandest scene he ever witnessed in the capitol. Among those whose eyes were riveted on the speaker full two hours and a half, were Thurlow Weed and Lieutenant Governor Raymond; the latter, at the conclusion of the address, exclaimed to a friend, “I would give twenty thousand dollars, if I could deliver that address in that manner.” Mr. Raymond is a first class graduate of Dartmouth, a rising politician, ranking foremost in the legislature; of course, his ideal of oratory must be of the most polished and finished description.

The style of Mr. Douglass in writing, is to me an intellectual puzzle. The strength, affluence and terseness may easily be accounted for, because the style of a man is the man; but how are we to account for that rare polish in his style of writing, which, most critically examined, seems the result of careful early culture among the best classics of our language; it equals if it does not surpass the style of Hugh Miller, which was the wonder of the British literary public, until he unraveled the mystery in the most interesting of autobiographies. But Frederick Douglass was still calking the seams of Baltimore clippers, and had only written a “pass,” at the age when Miller’s style was already formed.

I asked William Whipper, of Pennsylvania, the gentleman alluded to above, whether he thought Mr. Douglass's power inherited from the Negroid, or from what is called the Caucasian side of his make up? After some reflection, he frankly answered, "I must admit, although sorry to do so, that the Caucasian predominates." At that time, I almost agreed with him; but, facts narrated in the first part of this work, throw a different light on this interesting question.

We are left in the dark as to who was the paternal ancestor of our author; a fact which generally holds good of the Romuluses and Remuses who are to inaugurate the new birth of our republic. In the absence of testimony from the Caucasian side, we must see what evidence is given on the other side of the house.

"My grandmother, though advanced in years, * * * was yet a woman of power and spirit. She was marvelously straight in figure, elastic and muscular." (p. 46.)

After describing her skill in constructing nets, her perseverance in using them, and her wide-spread fame in the agricultural way he adds, "It happened to her—as it will happen to any careful and thrifty person residing in an ignorant and improvident neighborhood—to enjoy the reputation of being born to good luck." And his grandmother was a black woman.

"My mother was tall, and finely proportioned; of deep black, glossy complexion; had regular features; and among other slaves was remarkably sedate in her manners." "Being a field hand, she was obliged to walk twelve miles and return, between nightfall and daybreak, to see her children" (p. 54.) "I shall never forget the indescribable expression of her countenance when I told her that I had had no food since morning. * * * There was pity in her glance at me, and a fiery indignation at Aunt Katy at the same time; * * * * she read Aunt Katy a lecture which she never forgot." (p. 56.) "I learned after my mother's death, that she could read, and that she was the _only_ one of all the slaves and colored people in Tuckahoe who enjoyed that advantage. How she acquired this knowledge, I know not, for Tuckahoe is the last place in the world where she would be apt to find facilities for learning." (p. 57.) "There is, in _Prichard's Natural History of Man_, the head of a figure—on page 157—the features of which so resemble those of my mother, that I often recur to it with something of the feeling which I suppose others experience when looking upon the pictures of dear departed ones." (p. 52.)

The head alluded to is copied from the statue of Ramses the Great, an Egyptian king of the nineteenth dynasty. The authors of the _Types of Mankind_ give a side view of the same on page 148, remarking that the profile, "like Napoleon's, is superbly European!" The nearness of its resemblance to Mr. Douglass' mother rests upon the evidence of his memory, and judging from his almost marvelous feats of recollection of forms and outlines recorded in this book, this testimony may be admitted.

These facts show that for his energy, perseverance, eloquence, invective, sagacity, and wide sympathy, he is indebted to his Negro blood. The very marvel of his style would seem to be a development of that other marvel—how his mother learned to read. The versatility of talent which he wields, in common with Dumas, Ira Aldridge, and Miss Greenfield, would seem to be the result of the grafting of the Anglo-Saxon on good, original, Negro stock. If the friends of "Caucasus" choose to claim, for that region, what remains after this analysis—to wit: combination—they are welcome to it. They will forgive me for reminding them that the term "Caucasian" is dropped by recent writers on Ethnology; for the people about Mount Caucasus, are, and have ever been, Mongols. The great "white race" now seek paternity, according to Dr. Pickering, in Arabia—"Arida Nutrix" of the best breed of horses &c. Keep on, gentlemen; you will find yourselves in Africa, by-and-by. The Egyptians, like the Americans, were a _mixed race_, with some Negro blood circling around the throne, as well as in the mud hovels.

This is the proper place to remark of our author, that the same strong self-hood, which led him to measure strength with Mr. Covey, and to wrench himself from the embrace of the Garrisonians, and which has borne him through many resistances to the personal indignities offered him as a colored man, sometimes becomes a hyper-sensitiveness to such assaults as men of his mark will meet with, on paper. Keen and unscrupulous opponents have sought, and not unsuccessfully, to pierce him in this direction; for well they know, that if assailed, he will smite back.

It is not without a feeling of pride, dear reader, that I present you with this book. The son of a self-emancipated bond-woman, I feel joy in introducing to you my brother, who has rent his own bonds, and who, in his every relation—as a public man, as a husband and as a father—is such as does honor to the land which gave him birth. I shall place this book in the hands of the only child spared me, bidding him to strive and emulate its noble example. You may do likewise. It is an American book, for Americans, in the fullest sense of the idea. It shows that the worst of our institutions, in its worst aspect, cannot keep down energy, truthfulness, and earnest struggle for the right. It proves the justice and practicability of Immediate Emancipation. It shows that any man in our land, "no matter in what battle his liberty may have been cloven down, * * * * no matter what complexion an Indian or an African sun may

have burned upon him," not only may "stand forth redeemed and disenthralled," but may also stand up a candidate for the highest suffrage of a great people—the tribute of their honest, hearty admiration. Reader, _Vale! New York_

JAMES M'CUNE SMITH

CHAPTER I. _Childhood_

PLACE OF BIRTH—CHARACTER OF THE DISTRICT—TUCKAHOE—ORIGIN OF THE NAME—CHOPTANK RIVER—TIME OF BIRTH—GENEALOGICAL TREES—MODE OF COUNTING TIME—NAMES OF GRANDPARENTS—THEIR POSITION—GRANDMOTHER ESPECIALLY ESTEEMED—"BORN TO GOOD LUCK"—SWEET POTATOES—SUPERSTITION—THE LOG CABIN—ITS CHARMS—SEPARATING CHILDREN—MY AUNTS—THEIR NAMES—FIRST KNOWLEDGE OF BEING A SLAVE—OLD MASTER—GRIEFS AND JOYS OF CHILDHOOD—COMPARATIVE HAPPINESS OF THE SLAVE-BOY AND THE SON OF A SLAVEHOLDER.

In Talbot county, Eastern Shore, Maryland, near Easton, the county town of that county, there is a small district of country, thinly populated, and remarkable for nothing that I know of more than for the worn-out, sandy, desert-like appearance of its soil, the general dilapidation of its farms and fences, the indigent and spiritless character of its inhabitants, and the prevalence of ague and fever.

The name of this singularly unpromising and truly famine stricken district is Tuckahoe, a name well known to all Marylanders, black and white. It was given to this section of country probably, at the first, merely in derision; or it may possibly have been applied to it, as I have heard, because some one of its earlier inhabitants had been guilty of the petty meanness of stealing a hoe—or taking a hoe that did not belong to him. Eastern Shore men usually pronounce the word _took_, as _tuck; Took-a-hoe_, therefore, is, in Maryland parlance, _Tuckahoe_. But, whatever may have been its origin—and about this I will not be positive—that name has stuck to the district in question; and it is seldom mentioned but with contempt and derision, on account of the barrenness of its soil, and the ignorance, indolence, and poverty of its people. Decay and ruin are everywhere visible, and the thin population of the place would have quitted it long ago, but for the Choptank river, which runs through it, from which they take abundance of shad and herring, and plenty of ague and fever.

It was in this dull, flat, and unthrifty district, or neighborhood, surrounded by a white population of the lowest order, indolent and drunken to a proverb, and among slaves, who seemed to ask, _"Oh! what's the use?"_ every time they lifted a hoe, that I—without any fault of mine was born, and spent the first years of my childhood.

The reader will pardon so much about the place of my birth, on the score that it is always a fact of some importance to know where a man is born, if, indeed, it be important to know anything about him. In regard to the _time_ of my birth, I cannot be as definite as I have been respecting the _place_. Nor, indeed, can I impart much knowledge concerning my parents. Genealogical trees do not flourish among slaves. A person of some consequence here in the north, sometimes designated _father_, is literally abolished in slave law and slave practice. It is only once in a while that an exception is found to this statement. I never met with a slave who could tell me how old he was. Few slave-mothers know anything of the months of the year, nor of the days of the month. They keep no family records, with marriages, births, and deaths. They measure the ages of their children by spring time, winter time, harvest time, planting time, and the like; but these soon become undistinguishable and forgotten. Like other slaves, I cannot tell how old I am. This destitution was among my earliest troubles. I learned when I grew up, that my master—and this is the case with masters generally—allowed no questions to be put to him, by which a slave might learn his age. Such questions deemed evidence of impatience, and even of impudent curiosity. From certain events, however, the dates of which I have since learned, I suppose myself to have been born about the year 1817.

The first experience of life with me that I now remember—and I remember it but hazily—began in the family of my grandmother and grandfather. Betsey and Isaac Baily. They were quite advanced in life, and had long lived on the spot where they then resided. They were considered old settlers in the neighborhood, and, from certain circumstances, I infer that my grandmother, especially, was held in high esteem, far higher than is the lot of most colored persons in the slave states. She was a good nurse, and a capital hand at making nets for catching shad and herring; and these nets were in great demand, not only in Tuckahoe, but at Denton and Hillsboro, neighboring villages. She was not only good at making the nets, but was also somewhat famous for her good fortune in taking the fishes referred to. I have known her to be in the water half the day. Grandmother was likewise more provident than most of her neighbors in the preservation of seedling sweet potatoes, and it happened to her—as it will happen to any careful and thrifty

person residing in an ignorant and improvident community—to enjoy the reputation of having been born to “good luck.” Her “good luck” was owing to the exceeding care which she took in preventing the succulent root from getting bruised in the digging, and in placing it beyond the reach of frost, by actually burying it under the hearth of her cabin during the winter months. In the time of planting sweet potatoes, “Grandmother Betty,” as she was familiarly called, was sent for in all directions, simply to place the seedling potatoes in the hills; for superstition had it, that if “Grandmamma Betty but touches them at planting, they will be sure to grow and flourish.” This high reputation was full of advantage to her, and to the children around her. Though Tuckahoe had but few of the good things of life, yet of such as it did possess grandmother got a full share, in the way of presents. If good potato crops came after her planting, she was not forgotten by those for whom she planted; and as she was remembered by others, so she remembered the hungry little ones around her.

The dwelling of my grandmother and grandfather had few pretensions. It was a log hut, or cabin, built of clay, wood, and straw. At a distance it resembled—though it was smaller, less commodious and less substantial—the cabins erected in the western states by the first settlers. To my child’s eye, however, it was a noble structure, admirably adapted to promote the comforts and conveniences of its inmates. A few rough, Virginia fence-rails, flung loosely over the rafters above, answered the triple purpose of floors, ceilings, and bedsteads. To be sure, this upper apartment was reached only by a ladder—but what in the world for climbing could be better than a ladder? To me, this ladder was really a high invention, and possessed a sort of charm as I played with delight upon the rounds of it. In this little hut there was a large family of children: I dare not say how many. My grandmother—whether because too old for field service, or because she had so faithfully discharged the duties of her station in early life, I know not—enjoyed the high privilege of living in a cabin, separate from the quarter, with no other burden than her own support, and the necessary care of the little children, imposed. She evidently esteemed it a great fortune to live so. The children were not her own, but her grandchildren—the children of her daughters. She took delight in having them around her, and in attending to their few wants. The practice of separating children from their mother, and hiring the latter out at distances too great to admit of their meeting, except at long intervals, is a marked feature of the cruelty and barbarity of the slave system. But it is in harmony with the grand aim of slavery, which, always and everywhere, is to reduce man to a level with the brute. It is a successful method of obliterating from the mind and heart of the slave, all just ideas of the sacredness of _the family_, as an institution.

Most of the children, however, in this instance, being the children of my grandmother’s daughters, the notions of family, and the reciprocal duties and benefits of the relation, had a better chance of being understood than where children are placed—as they often are in the hands of strangers, who have no care for them, apart from the wishes of their masters. The daughters of my grandmother were five in number. Their names were JENNY, ESTHER, MILLY, PRISCILLA, and HARRIET. The daughter last named was my mother, of whom the reader shall learn more by-and-by.

Living here, with my dear old grandmother and grandfather, it was a long time before I knew myself to be _a slave_. I knew many other things before I knew that. Grandmother and grandfather were the greatest people in the world to me; and being with them so snugly in their own little cabin—I supposed it be their own—knowing no higher authority over me or the other children than the authority of grandmamma, for a time there was nothing to disturb me; but, as I grew larger and older, I learned by degrees the sad fact, that the “little hut,” and the lot on which it stood, belonged not to my dear old grandparents, but to some person who lived a great distance off, and who was called, by grandmother, “OLD MASTER.” I further learned the sadder fact, that not only the house and lot, but that grandmother herself, (grandfather was free,) and all the little children around her, belonged to this mysterious personage, called by grandmother, with every mark of reverence, “Old Master.” Thus early did clouds and shadows begin to fall upon my path. Once on the track—troubles never come singly—I was not long in finding out another fact, still more grievous to my childish heart. I was told that this “old master,” whose name seemed ever to be mentioned with fear and shuddering, only allowed the children to live with grandmother for a limited time, and that in fact as soon as they were big enough, they were promptly taken away, to live with the said “old master.” These were distressing revelations indeed; and though I was quite too young to comprehend the full import of the intelligence, and mostly spent my childhood days in gleesome sports with the other children, a shade of disquiet rested upon me.

The absolute power of this distant “old master” had touched my young spirit with but the point of its cold, cruel iron, and left me something to brood over after the play and in moments of repose. Grandmammy was, indeed, at that time, all the world to me; and the thought of being separated from her, in any considerable time, was more than an unwelcome intruder. It was intolerable.

Children have their sorrows as well as men and women; and it would be well to remember this in our dealings with them. SLAVE-children _are_ children, and prove no exceptions to the general rule. The liability to be separated from my grandmother, seldom or never to see her again, haunted me. I dreaded the thought of going to live with that mysterious “old master,” whose name

I never heard mentioned with affection, but always with fear. I look back to this as among the heaviest of my childhood's sorrows. My grandmother! my grandmother! and the little hut, and the joyous circle under her care, but especially _she_, who made us sorry when she left us but for an hour, and glad on her return,—how could I leave her and the good old home?

But the sorrows of childhood, like the pleasures of after life, are transient. It is not even within the power of slavery to write _indelible_ sorrow, at a single dash, over the heart of a child.

The tear down childhood's cheek that flows, Is like the dew-drop on the rose— When next the summer breeze comes by, And waves the bush—the flower is dry.

There is, after all, but little difference in the measure of contentment felt by the slave-child neglected and the slaveholder's child cared for and petted. The spirit of the All Just mercifully holds the balance for the young.

The slaveholder, having nothing to fear from impotent childhood, easily affords to refrain from cruel inflictions; and if cold and hunger do not pierce the tender frame, the first seven or eight years of the slave-boy's life are about as full of sweet content as those of the most favored and petted _white_ children of the slaveholder. The slave-boy escapes many troubles which befall and vex his white brother. He seldom has to listen to lectures on propriety of behavior, or on anything else. He is never chided for handling his little knife and fork improperly or awkwardly, for he uses none. He is never reprimanded for soiling the table-cloth, for he takes his meals on the clay floor. He never has the misfortune, in his games or sports, of soiling or tearing his clothes, for he has almost none to soil or tear. He is never expected to act like a nice little gentleman, for he is only a rude little slave. Thus, freed from all restraint, the slave-boy can be, in his life and conduct, a genuine boy, doing whatever his boyish nature suggests; enacting, by turns, all the strange antics and freaks of horses, dogs, pigs, and barn-door fowls, without in any manner compromising his dignity, or incurring reproach of any sort. He literally runs wild; has no pretty little verses to learn in the nursery; no nice little speeches to make for aunts, uncles, or cousins, to show how smart he is; and, if he can only manage to keep out of the way of the heavy feet and fists of the older slave boys, he may trot on, in his joyous and roguish tricks, as happy as any little heathen under the palm trees of Africa. To be sure, he is occasionally reminded, when he stumbles in the path of his master—and this he early learns to avoid—that he is eating his _"white bread,"_ and that he will be made to _"see sights"_ by-and-by. The threat is soon forgotten; the shadow soon passes, and our sable boy continues to roll in the dust, or play in the mud, as bests suits him, and in the veriest freedom. If he feels uncomfortable, from mud or from dust, the coast is clear; he can plunge into the river or the pond, without the ceremony of undressing, or the fear of wetting his clothes; his little tow-linen shirt—for that is all he has on—is easily dried; and it needed ablution as much as did his skin. His food is of the coarsest kind, consisting for the most part of cornmeal mush, which often finds it way from the wooden tray to his mouth in an oyster shell. His days, when the weather is warm, are spent in the pure, open air, and in the bright sunshine. He always sleeps in airy apartments; he seldom has to take powders, or to be paid to swallow pretty little sugar-coated pills, to cleanse his blood, or to quicken his appetite. He eats no candies; gets no lumps of loaf sugar; always relishes his food; cries but little, for nobody cares for his crying; learns to esteem his bruises but slight, because others so esteem them. In a word, he is, for the most part of the first eight years of his life, a spirited, joyous, uproarious, and happy boy, upon whom troubles fall only like water on a duck's back. And such a boy, so far as I can now remember, was the boy whose life in slavery I am now narrating.

CHAPTER II. _Removed from My First Home_

THE NAME "OLD MASTER" A TERROR—COLONEL LLOYD'S PLANTATION—WYE RIVER—WHENCE ITS NAME—POSITION OF THE LLOYDS—HOME ATTRACTION—MEET OFFERING—JOURNEY FROM TUCKAHOE TO WYE RIVER—SCENE ON REACHING OLD MASTER'S—DEPARTURE OF GRANDMOTHER—STRANGE MEETING OF SISTERS AND BROTHERS—REFUSAL TO BE COMFORTED—SWEET SLEEP.

That mysterious individual referred to in the first chapter as an object of terror among the inhabitants of our little cabin, under the ominous title of "old master," was really a man of some consequence. He owned several farms in Tuckahoe; was the chief clerk and butler on the home plantation of Col. Edward Lloyd; had overseers on his own farms; and gave directions to overseers on the farms belonging to Col. Lloyd. This plantation is situated on Wye river—the river receiving its name, doubtless, from Wales, where the Lloyds originated. They (the Lloyds) are an old and honored family in Maryland, exceedingly wealthy. The home plantation, where they have resided, perhaps for a century or more, is one of the largest, most fertile, and best appointed, in the state.

About this plantation, and about that queer old master—who must be something more than a man, and something worse than an angel—the reader will easily imagine that I was not only curious, but eager, to know all that could be known. Unhappily for me, however, all the information I could get concerning him increased my great dread of being carried thither—of being separated from and deprived of the protection of my grandmother and grandfather. It was, evidently, a great thing to go to Col. Lloyd's; and I was not without a little curiosity to see the place; but no amount of coaxing could induce in me the wish to remain there. The fact is, such was my dread of leaving the little cabin, that I wished to remain little forever, for I knew the taller I grew the shorter my stay. The old cabin, with its rail floor and rail bedsteads upstairs, and its clay floor downstairs, and its dirt chimney, and windowless sides, and that most curious piece of workmanship dug in front of the fireplace, beneath which grandmammy placed the sweet potatoes to keep them from the frost, was MY HOME—the only home I ever had; and I loved it, and all connected with it. The old fences around it, and the stumps in the edge of the woods near it, and the squirrels that ran, skipped, and played upon them, were objects of interest and affection. There, too, right at the side of the hut, stood the old well, with its stately and skyward-pointing beam, so aptly placed between the limbs of what had once been a tree, and so nicely balanced that I could move it up and down with only one hand, and could get a drink myself without calling for help. Where else in the world could such a well be found, and where could such another home be met with? Nor were these all the attractions of the place. Down in a little valley, not far from grandmammy's cabin, stood Mr. Lee's mill, where the people came often in large numbers to get their corn ground. It was a watermill; and I never shall be able to tell the many things thought and felt, while I sat on the bank and watched that mill, and the turning of that ponderous wheel. The mill-pond, too, had its charms; and with my pinhook, and thread line, I could get _nibbles_, if I could catch no fish. But, in all my sports and plays, and in spite of them, there would, occasionally, come the painful foreboding that I was not long to remain there, and that I must soon be called away to the home of old master.

I was A SLAVE—born a slave and though the fact was incomprehensible to me, it conveyed to my mind a sense of my entire dependence on the will of _somebody_ I had never seen; and, from some cause or other, I had been made to fear this somebody above all else on earth. Born for another's benefit, as the _firstling_ of the cabin flock I was soon to be selected as a meet offering to the fearful and inexorable _demigod_, whose huge image on so many occasions haunted my childhood's imagination. When the time of my departure was decided upon, my grandmother, knowing my fears, and in pity for them, kindly kept me ignorant of the dreaded event about to transpire. Up to the morning (a beautiful summer morning) when we were to start, and, indeed, during the whole journey—a journey which, child as I was, I remember as well as if it were yesterday—she kept the sad fact hidden from me. This reserve was necessary; for, could I have known all, I should have given grandmother some trouble in getting me started. As it was, I was helpless, and she—dear woman!—led me along by the hand, resisting, with the reserve and solemnity of a priestess, all my inquiring looks to the last.

The distance from Tuckahoe to Wye river—where my old master lived—was full twelve miles, and the walk was quite a severe test of the endurance of my young legs. The journey would have proved too severe for me, but that my dear old grandmother—blessings on her memory!—afforded occasional relief by "toting" me (as Marylanders have it) on her shoulder. My grandmother, though advanced in years—as was evident from more than one gray hair, which peeped from between the ample and graceful folds of her newly-ironed bandana turban—was yet a woman of power and spirit. She was marvelously straight in figure, elastic, and muscular. I seemed hardly to be a burden to her. She would have "toted" me farther, but that I felt myself too much of a man to allow it, and insisted on walking. Releasing dear grandmamma from carrying me, did not make me altogether independent of her, when we happened to pass through portions of the somber woods which lay between Tuckahoe and Wye river. She often found me increasing the energy of my grip, and holding her clothing, lest something should come out of the woods and eat me up. Several old logs and stumps imposed upon me, and got themselves taken for wild beasts. I could see their legs, eyes, and ears, or I could see something like eyes, legs, and ears, till I got close enough to them to see that the eyes were knots, washed white with rain, and the legs were broken limbs, and the ears, only ears owing to the point from which they were seen. Thus early I learned that the point from which a thing is viewed is of some importance.

As the day advanced the heat increased; and it was not until the afternoon that we reached the much dreaded end of the journey. I found myself in the midst of a group of children of many colors; black, brown, copper colored, and nearly white. I had not seen so many children before. Great houses loomed up in different directions, and a great many men and women were at work in the fields. All this hurry, noise, and singing was very different from the stillness of Tuckahoe. As a new comer, I was an object of special interest; and, after laughing and yelling around me, and playing all sorts of wild tricks, they (the children) asked me to go out and play with them. This I refused to do, preferring to stay with grandmamma. I could not help feeling that our being there boded no good to me. Grandmamma looked sad. She was soon to lose another object of affection, as she had lost many before. I knew she was unhappy, and the shadow fell from her brow on me, though I knew not the cause.

All suspense, however, must have an end; and the end of mine, in this instance, was at hand. Affectionately patting me on the head, and exhorting me to be a good boy, grandmamma told me to go and play with the little children. “They are kin to you,” said she; “go and play with them.” Among a number of cousins were Phil, Tom, Steve, and Jerry, Nance and Betty.

Grandmother pointed out my brother PERRY, my sister SARAH, and my sister ELIZA, who stood in the group. I had never seen my brother nor my sisters before; and, though I had sometimes heard of them, and felt a curious interest in them, I really did not understand what they were to me, or I to them. We were brothers and sisters, but what of that? Why should they be attached to me, or I to them? Brothers and sisters we were by blood; but _slavery_ had made us strangers. I heard the words brother and sisters, and knew they must mean something; but slavery had robbed these terms of their true meaning. The experience through which I was passing, they had passed through before. They had already been initiated into the mysteries of old master’s domicile, and they seemed to look upon me with a certain degree of compassion; but my heart clave to my grandmother. Think it not strange, dear reader, that so little sympathy of feeling existed between us. The conditions of brotherly and sisterly feeling were wanting—we had never nestled and played together. My poor mother, like many other slave-women, had many _children_, but NO FAMILY! The domestic hearth, with its holy lessons and precious endearments, is abolished in the case of a slave-mother and her children. “Little children, love one another,” are words seldom heard in a slave cabin.

I really wanted to play with my brother and sisters, but they were strangers to me, and I was full of fear that grandmother might leave without taking me with her. Entreated to do so, however, and that, too, by my dear grandmother, I went to the back part of the house, to play with them and the other children. _Play_, however, I did not, but stood with my back against the wall, witnessing the playing of the others. At last, while standing there, one of the children, who had been in the kitchen, ran up to me, in a sort of roguish glee, exclaiming, “Fed, Fed! grandmammy gone! grandmammy gone!” I could not believe it; yet, fearing the worst, I ran into the kitchen, to see for myself, and found it even so. Grandmammy had indeed gone, and was now far away, “clean” out of sight. I need not tell all that happened now. Almost heart-broken at the discovery, I fell upon the ground, and wept a boy’s bitter tears, refusing to be comforted. My brother and sisters came around me, and said, “Don’t cry,” and gave me peaches and pears, but I flung them away, and refused all their kindly advances. I had never been deceived before; and I felt not only grieved at parting—as I supposed forever—with my grandmother, but indignant that a trick had been played upon me in a matter so serious.

It was now late in the afternoon. The day had been an exciting and wearisome one, and I knew not how or where, but I suppose I sobbed myself to sleep. There is a healing in the angel wing of sleep, even for the slave-boy; and its balm was never more welcome to any wounded soul than it was to mine, the first night I spent at the domicile of old master. The reader may be surprised that I narrate so minutely an incident apparently so trivial, and which must have occurred when I was not more than seven years old; but as I wish to give a faithful history of my experience in slavery, I cannot withhold a circumstance which, at the time, affected me so deeply. Besides, this was, in fact, my first introduction to the realities of slavery.

CHAPTER III. _Parentage_

MY FATHER SHROUDED IN MYSTERY—MY MOTHER—HER PERSONAL APPEARANCE—INTERFERENCE OF SLAVERY WITH THE NATURAL AFFECTIONS OF MOTHER AND CHILDREN—SITUATION OF MY MOTHER—HER NIGHTLY VISITS TO HER BOY—STRIKING INCIDENT—HER DEATH—HER PLACE OF BURIAL.

If the reader will now be kind enough to allow me time to grow bigger, and afford me an opportunity for my experience to become greater, I will tell him something, by-and-by, of slave life, as I saw, felt, and heard it, on Col. Edward Lloyd’s plantation, and at the house of old master, where I had now, despite of myself, most suddenly, but not unexpectedly, been dropped. Meanwhile, I will redeem my promise to say something more of my dear mother.

I say nothing of _father_, for he is shrouded in a mystery I have never been able to penetrate. Slavery does away with fathers, as it does away with families. Slavery has no use for either fathers or families, and its laws do not recognize their existence in the social arrangements of the plantation. When they _do_ exist, they are not the outgrowths of slavery, but are antagonistic to that system. The order of civilization is reversed here. The name of the child is not expected to be that of its father, and his condition does not necessarily affect that of the child. He may be the slave of Mr. Tilgman; and his child, when born, may be the slave of Mr. Gross. He may be a _freeman;_ and yet his child may be a _chattel_. He may be white, glorying in the purity of his Anglo-Saxon blood; and his child may be ranked with the blackest slaves. Indeed, he _may_ be, and often _is_, master and father to the same child. He can be father without being a husband, and may sell his child without incurring reproach, if the child be by a woman in whose veins

courses one thirty-second part of African blood. My father was a white man, or nearly white. It was sometimes whispered that my master was my father.

But to return, or rather, to begin. My knowledge of my mother is very scanty, but very distinct. Her personal appearance and bearing are ineffaceably stamped upon my memory. She was tall, and finely proportioned; of deep black, glossy complexion; had regular features, and, among the other slaves, was remarkably sedate in her manners. There is in _Prichard's Natural History of Man_, the head of a figure—on page 157—the features of which so resemble those of my mother, that I often recur to it with something of the feeling which I suppose others experience when looking upon the pictures of dear departed ones.

Yet I cannot say that I was very deeply attached to my mother; certainly not so deeply as I should have been had our relations in childhood been different. We were separated, according to the common custom, when I was but an infant, and, of course, before I knew my mother from any one else.

The germs of affection with which the Almighty, in his wisdom and mercy, arms the hopeless infant against the ills and vicissitudes of his lot, had been directed in their growth toward that loving old grandmother, whose gentle hand and kind deportment it was in the first effort of my infantile understanding to comprehend and appreciate. Accordingly, the tenderest affection which a beneficent Father allows, as a partial compensation to the mother for the pains and lacerations of her heart, incident to the maternal relation, was, in my case, diverted from its true and natural object, by the envious, greedy, and treacherous hand of slavery. The slave-mother can be spared long enough from the field to endure all the bitterness of a mother's anguish, when it adds another name to a master's ledger, but _not_ long enough to receive the joyous reward afforded by the intelligent smiles of her child. I never think of this terrible interference of slavery with my infantile affections, and its diverting them from their natural course, without feelings to which I can give no adequate expression.

I do not remember to have seen my mother at my grandmother's at any time. I remember her only in her visits to me at Col. Lloyd's plantation, and in the kitchen of my old master. Her visits to me there were few in number, brief in duration, and mostly made in the night. The pains she took, and the toil she endured, to see me, tells me that a true mother's heart was hers, and that slavery had difficulty in paralyzing it with unmotherly indifference.

My mother was hired out to a Mr. Stewart, who lived about twelve miles from old master's, and, being a field hand, she seldom had leisure, by day, for the performance of the journey. The nights and the distance were both obstacles to her visits. She was obliged to walk, unless chance flung into her way an opportunity to ride; and the latter was sometimes her good luck. But she always had to walk one way or the other. It was a greater luxury than slavery could afford, to allow a black slave-mother a horse or a mule, upon which to travel twenty-four miles, when she could walk the distance. Besides, it is deemed a foolish whim for a slave-mother to manifest concern to see her children, and, in one point of view, the case is made out—she can do nothing for them. She has no control over them; the master is even more than the mother, in all matters touching the fate of her child. Why, then, should she give herself any concern? She has no responsibility. Such is the reasoning, and such the practice. The iron rule of the plantation, always passionately and violently enforced in that neighborhood, makes flogging the penalty of failing to be in the field before sunrise in the morning, unless special permission be given to the absenting slave. "I went to see my child," is no excuse to the ear or heart of the overseer.

One of the visits of my mother to me, while at Col. Lloyd's, I remember very vividly, as affording a bright gleam of a mother's love, and the earnestness of a mother's care.

"I had on that day offended "Aunt Katy," (called "Aunt" by way of respect,) the cook of old master's establishment. I do not now remember the nature of my offense in this instance, for my offenses were numerous in that quarter, greatly depending, however, upon the mood of Aunt Katy, as to their heinousness; but she had adopted, that day, her favorite mode of punishing me, namely, making me go without food all day—that is, from after breakfast. The first hour or two after dinner, I succeeded pretty well in keeping up my spirits; but though I made an excellent stand against the foe, and fought bravely during the afternoon, I knew I must be conquered at last, unless I got the accustomed reenforcement of a slice of corn bread, at sundown. Sundown came, but _no bread_, and, in its stead, their came the threat, with a scowl well suited to its terrible import, that she "meant to _starve the life out of me!"_ Brandishing her knife, she chopped off the heavy slices for the other children, and put the loaf away, muttering, all the while, her savage designs upon myself. Against this disappointment, for I was expecting that her heart would relent at last, I made an extra effort to maintain my dignity; but when I saw all the other children around me with merry and satisfied faces, I could stand it no longer. I went out behind the house, and cried like a fine fellow! When tired of this, I returned to the kitchen, sat by the fire, and

brooded over my hard lot. I was too hungry to sleep. While I sat in the corner, I caught sight of an ear of Indian corn on an upper shelf of the kitchen. I watched my chance, and got it, and, shelling off a few grains, I put it back again. The grains in my hand, I quickly put in some ashes, and covered them with embers, to roast them. All this I did at the risk of getting a brutual thumping, for Aunt Katy could beat, as well as starve me. My corn was not long in roasting, and, with my keen appetite, it did not matter even if the grains were not exactly done. I eagerly pulled them out, and placed them on my stool, in a clever little pile. Just as I began to help myself to my very dry meal, in came my dear mother. And now, dear reader, a scene occurred which was altogether worth beholding, and to me it was instructive as well as interesting. The friendless and hungry boy, in his extremest need—and when he did not dare to look for succor—found himself in the strong, protecting arms of a mother; a mother who was, at the moment (being endowed with high powers of manner as well as matter) more than a match for all his enemies. I shall never forget the indescribable expression of her countenance, when I told her that I had had no food since morning; and that Aunt Katy said she "meant to starve the life out of me." There was pity in her glance at me, and a fiery indignation at Aunt Katy at the same time; and, while she took the corn from me, and gave me a large ginger cake, in its stead, she read Aunt Katy a lecture which she never forgot. My mother threatened her with complaining to old master in my behalf; for the latter, though harsh and cruel himself, at times, did not sanction the meanness, injustice, partiality and oppressions enacted by Aunt Katy in the kitchen. That night I learned the fact, that I was, not only a child, but _somebody's_ child. The "sweet cake" my mother gave me was in the shape of a heart, with a rich, dark ring glazed upon the edge of it. I was victorious, and well off for the moment; prouder, on my mother's knee, than a king upon his throne. But my triumph was short. I dropped off to sleep, and waked in the morning only to find my mother gone, and myself left at the mercy of the sable virago, dominant in my old master's kitchen, whose fiery wrath was my constant dread.

I do not remember to have seen my mother after this occurrence. Death soon ended the little communication that had existed between us; and with it, I believe, a life judging from her weary, sad, down-cast countenance and mute demeanor—full of heartfelt sorrow. I was not allowed to visit her during any part of her long illness; nor did I see her for a long time before she was taken ill and died. The heartless and ghastly form of _slavery_ rises between mother and child, even at the bed of death. The mother, at the verge of the grave, may not gather her children, to impart to them her holy admonitions, and invoke for them her dying benediction. The bond-woman lives as a slave, and is left to die as a beast; often with fewer attentions than are paid to a favorite horse. Scenes of sacred tenderness, around the death-bed, never forgotten, and which often arrest the vicious and confirm the virtuous during life, must be looked for among the free, though they sometimes occur among the slaves. It has been a life-long, standing grief to me, that I knew so little of my mother; and that I was so early separated from her. The counsels of her love must have been beneficial to me. The side view of her face is imaged on my memory, and I take few steps in life, without feeling her presence; but the image is mute, and I have no striking words of her's treasured up.

I learned, after my mother's death, that she could read, and that she was the _only_ one of all the slaves and colored people in Tuckahoe who enjoyed that advantage. How she acquired this knowledge, I know not, for Tuckahoe is the last place in the world where she would be apt to find facilities for learning. I can, therefore, fondly and proudly ascribe to her an earnest love of knowledge. That a "field hand" should learn to read, in any slave state, is remarkable; but the achievement of my mother, considering the place, was very extraordinary; and, in view of that fact, I am quite willing, and even happy, to attribute any love of letters I possess, and for which I have got—despite of prejudices only too much credit, _not_ to my admitted Anglo-Saxon paternity, but to the native genius of my sable, unprotected, and uncultivated _mother_—a woman, who belonged to a race whose mental endowments it is, at present, fashionable to hold in disparagement and contempt.

Summoned away to her account, with the impassable gulf of slavery between us during her entire illness, my mother died without leaving me a single intimation of _who_ my father was. There was a whisper, that my master was my father; yet it was only a whisper, and I cannot say that I ever gave it credence. Indeed, I now have reason to think he was not; nevertheless, the fact remains, in all its glaring odiousness, that, by the laws of slavery, children, in all cases, are reduced to the condition of their mothers. This arrangement admits of the greatest license to brutal slaveholders, and their profligate sons, brothers, relations and friends, and gives to the pleasure of sin, the additional attraction of profit. A whole volume might be written on this single feature of slavery, as I have observed it.

One might imagine, that the children of such connections, would fare better, in the hands of their masters, than other slaves. The rule is quite the other way; and a very little reflection will satisfy the reader that such is the case. A man who will enslave his own blood, may not be safely relied on for magnanimity. Men do not love those who remind them of their sins unless they have a mind to repent—and the mulatto child's face is a standing accusation against him who is master and father to the child. What is still worse, perhaps, such a child is a constant offense to the wife. She hates its very presence, and when a slaveholding woman hates,

she wants not means to give that hate telling effect. Women—white women, I mean—are IDOLS at the south, not WIVES, for the slave women are preferred in many instances; and if these _idols_ but nod, or lift a finger, woe to the poor victim: kicks, cuffs and stripes are sure to follow. Masters are frequently compelled to sell this class of their slaves, out of deference to the feelings of their white wives; and shocking and scandalous as it may seem for a man to sell his own blood to the traffickers in human flesh, it is often an act of humanity toward the slave-child to be thus removed from his merciless tormentors.

It is not within the scope of the design of my simple story, to comment upon every phase of slavery not within my experience as a slave.

But, I may remark, that, if the lineal descendants of Ham are only to be enslaved, according to the scriptures, slavery in this country will soon become an unscriptural institution; for thousands are ushered into the world, annually, who—like myself—owe their existence to white fathers, and, most frequently, to their masters, and master's sons. The slave-woman is at the mercy of the fathers, sons or brothers of her master. The thoughtful know the rest.

After what I have now said of the circumstances of my mother, and my relations to her, the reader will not be surprised, nor be disposed to censure me, when I tell but the simple truth, viz: that I received the tidings of her death with no strong emotions of sorrow for her, and with very little regret for myself on account of her loss. I had to learn the value of my mother long after her death, and by witnessing the devotion of other mothers to their children.

There is not, beneath the sky, an enemy to filial affection so destructive as slavery. It had made my brothers and sisters strangers to me; it converted the mother that bore me, into a myth; it shrouded my father in mystery, and left me without an intelligible beginning in the world.

My mother died when I could not have been more than eight or nine years old, on one of old master's farms in Tuckahoe, in the neighborhood of Hillsborough. Her grave is, as the grave of the dead at sea, unmarked, and without stone or stake.

CHAPTER IV. _A General Survey of the Slave Plantation_

ISOLATION OF LLOYD S PLANTATION—PUBLIC OPINION THERE NO PROTECTION TO THE SLAVE—ABSOLUTE POWER OF THE OVERSEER—NATURAL AND ARTIFICIAL CHARMS OF THE PLACE—ITS BUSINESS-LIKE APPEARANCE—SUPERSTITION ABOUT THE BURIAL GROUND—GREAT IDEAS OF COL. LLOYD—ETIQUETTE AMONG SLAVES—THE COMIC SLAVE DOCTOR—PRAYING AND FLOGGING—OLD MASTER LOSING ITS TERRORS—HIS BUSINESS—CHARACTER OF AUNT KATY—SUFFERINGS FROM HUNGER—OLD MASTER'S HOME—JARGON OF THE PLANTATION—GUINEA SLAVES—MASTER DANIEL—FAMILY OF COL. LLOYD—FAMILY OF CAPT. ANTHONY—HIS SOCIAL POSITION—NOTIONS OF RANK AND STATION.

It is generally supposed that slavery, in the state of Maryland, exists in its mildest form, and that it is totally divested of those harsh and terrible peculiarities, which mark and characterize the slave system, in the southern and south-western states of the American union. The argument in favor of this opinion, is the contiguity of the free states, and the exposed condition of slavery in Maryland to the moral, religious and humane sentiment of the free states.

I am not about to refute this argument, so far as it relates to slavery in that state, generally; on the contrary, I am willing to admit that, to this general point, the arguments is well grounded. Public opinion is, indeed, an unfailing restraint upon the cruelty and barbarity of masters, overseers, and slave-drivers, whenever and wherever it can reach them; but there are certain secluded and out-of-the-way places, even in the state of Maryland, seldom visited by a single ray of healthy public sentiment—where slavery, wrapt in its own congenial, midnight darkness, _can_, and _does_, develop all its malign and shocking characteristics; where it can be indecent without shame, cruel without shuddering, and murderous without apprehension or fear of exposure.

Just such a secluded, dark, and out-of-the-way place, is the "home plantation" of Col. Edward Lloyd, on the Eastern Shore, Maryland. It is far away from all the great thoroughfares, and is proximate to no town or village. There is neither school-house, nor town-house in its neighborhood. The school-house is unnecessary, for there are no children to go to school. The children and grand-children of Col. Lloyd were taught in the house, by a private tutor—a Mr. Page a tall, gaunt sapling of a man, who did not speak a dozen words to a slave in a whole year. The overseers' children go off somewhere to school; and they, therefore, bring no foreign or dangerous influence from abroad, to embarrass the natural operation of the slave system of the place. Not even the mechanics—through whom there is an occasional out-burst of honest and telling indignation, at cruelty and wrong on other

plantations—are white men, on this plantation. Its whole public is made up of, and divided into, three classes—SLAVEHOLDERS, SLAVES and OVERSEERS. Its blacksmiths, wheelwrights, shoemakers, weavers, and coopers, are slaves. Not even commerce, selfish and iron-hearted at it is, and ready, as it ever is, to side with the strong against the weak—the rich against the poor—is trusted or permitted within its secluded precincts. Whether with a view of guarding against the escape of its secrets, I know not, but it is a fact, the every leaf and grain of the produce of this plantation, and those of the neighboring farms belonging to Col. Lloyd, are transported to Baltimore in Col. Lloyd's own vessels; every man and boy on board of which—except the captain—are owned by him. In return, everything brought to the plantation, comes through the same channel. Thus, even the glimmering and unsteady light of trade, which sometimes exerts a civilizing influence, is excluded from this "tabooed" spot.

Nearly all the plantations or farms in the vicinity of the "home plantation" of Col. Lloyd, belong to him; and those which do not, are owned by personal friends of his, as deeply interested in maintaining the slave system, in all its rigor, as Col. Lloyd himself. Some of his neighbors are said to be even more stringent than he. The Skinners, the Peakers, the Tilgmans, the Lockermans, and the Gipsons, are in the same boat; being slaveholding neighbors, they may have strengthened each other in their iron rule. They are on intimate terms, and their interests and tastes are identical.

Public opinion in such a quarter, the reader will see, is not likely to very efficient in protecting the slave from cruelty. On the contrary, it must increase and intensify his wrongs. Public opinion seldom differs very widely from public practice. To be a restraint upon cruelty and vice, public opinion must emanate from a humane and virtuous community. To no such humane and virtuous community, is Col. Lloyd's plantation exposed. That plantation is a little nation of its own, having its own language, its own rules, regulations and customs. The laws and institutions of the state, apparently touch it nowhere. The troubles arising here, are not settled by the civil power of the state. The overseer is generally accuser, judge, jury, advocate and executioner. The criminal is always dumb. The overseer attends to all sides of a case.

There are no conflicting rights of property, for all the people are owned by one man; and they can themselves own no property. Religion and politics are alike excluded. One class of the population is too high to be reached by the preacher; and the other class is too low to be cared for by the preacher. The poor have the gospel preached to them, in this neighborhood, only when they are able to pay for it. The slaves, having no money, get no gospel. The politician keeps away, because the people have no votes, and the preacher keeps away, because the people have no money. The rich planter can afford to learn politics in the parlor, and to dispense with religion altogether.

In its isolation, seclusion, and self-reliant independence, Col. Lloyd's plantation resembles what the baronial domains were during the middle ages in Europe. Grim, cold, and unapproachable by all genial influences from communities without, _there it stands;_ full three hundred years behind the age, in all that relates to humanity and morals.

This, however, is not the only view that the place presents. Civilization is shut out, but nature cannot be. Though separated from the rest of the world; though public opinion, as I have said, seldom gets a chance to penetrate its dark domain; though the whole place is stamped with its own peculiar, ironlike individuality; and though crimes, high-handed and atrocious, may there be committed, with almost as much impunity as upon the deck of a pirate ship—it is, nevertheless, altogether, to outward seeming, a most strikingly interesting place, full of life, activity, and spirit; and presents a very favorable contrast to the indolent monotony and languor of Tuckahoe. Keen as was my regret and great as was my sorrow at leaving the latter, I was not long in adapting myself to this, my new home. A man's troubles are always half disposed of, when he finds endurance his only remedy. I found myself here; there was no getting away; and what remained for me, but to make the best of it? Here were plenty of children to play with, and plenty of places of pleasant resort for boys of my age, and boys older. The little tendrils of affection, so rudely and treacherously broken from around the darling objects of my grandmother's hut, gradually began to extend, and to entwine about the new objects by which I now found myself surrounded.

There was a windmill (always a commanding object to a child's eye) on Long Point—a tract of land dividing Miles river from the Wye a mile or more from my old master's house. There was a creek to swim in, at the bottom of an open flat space, of twenty acres or more, called "the Long Green"—a very beautiful play-ground for the children.

In the river, a short distance from the shore, lying quietly at anchor, with her small boat dancing at her stern, was a large sloop—the Sally Lloyd; called by that name in honor of a favorite daughter of the colonel. The sloop and the mill were wondrous things, full of thoughts and ideas. A child cannot well look at such objects without _thinking_.

Then here were a great many houses; human habitations, full of the mysteries of life at every stage of it. There was the little red house, up the road, occupied by Mr. Sevier, the overseer. A little nearer to my old master's, stood a very long, rough, low building, literally alive with slaves, of all ages, conditions and sizes. This was called "the Longe Quarter." Perched upon a hill, across the Long Green, was a very tall, dilapidated, old brick building—the architectural dimensions of which proclaimed its erection for a different purpose—now occupied by slaves, in a similar manner to the Long Quarter. Besides these, there were numerous other slave houses and huts, scattered around in the neighborhood, every nook and corner of which was completely occupied. Old master's house, a long, brick building, plain, but substantial, stood in the center of the plantation life, and constituted one independent establishment on the premises of Col. Lloyd.

Besides these dwellings, there were barns, stables, store-houses, and tobacco-houses; blacksmiths' shops, wheelwrights' shops, coopers' shops—all objects of interest; but, above all, there stood the grandest building my eyes had then ever beheld, called, by every one on the plantation, the "Great House." This was occupied by Col. Lloyd and his family. They occupied it; _I_ enjoyed it. The great house was surrounded by numerous and variously shaped out-buildings. There were kitchens, wash-houses, dairies, summer-house, green-houses, hen-houses, turkey-houses, pigeon-houses, and arbors, of many sizes and devices, all neatly painted, and altogether interspersed with grand old trees, ornamental and primitive, which afforded delightful shade in summer, and imparted to the scene a high degree of stately beauty. The great house itself was a large, white, wooden building, with wings on three sides of it. In front, a large portico, extending the entire length of the building, and supported by a long range of columns, gave to the whole establishment an air of solemn grandeur. It was a treat to my young and gradually opening mind, to behold this elaborate exhibition of wealth, power, and vanity. The carriage entrance to the house was a large gate, more than a quarter of a mile distant from it; the intermediate space was a beautiful lawn, very neatly trimmed, and watched with the greatest care. It was dotted thickly over with delightful trees, shrubbery, and flowers. The road, or lane, from the gate to the great house, was richly paved with white pebbles from the beach, and, in its course, formed a complete circle around the beautiful lawn. Carriages going in and retiring from the great house, made the circuit of the lawn, and their passengers were permitted to behold a scene of almost Eden-like beauty. Outside this select inclosure, were parks, where as about the residences of the English nobility—rabbits, deer, and other wild game, might be seen, peering and playing about, with none to molest them or make them afraid. The tops of the stately poplars were often covered with the red-winged black-birds, making all nature vocal with the joyous life and beauty of their wild, warbling notes. These all belonged to me, as well as to Col. Edward Lloyd, and for a time I greatly enjoyed them.

A short distance from the great house, were the stately mansions of the dead, a place of somber aspect. Vast tombs, embowered beneath the weeping willow and the fir tree, told of the antiquities of the Lloyd family, as well as of their wealth. Superstition was rife among the slaves about this family burying ground. Strange sights had been seen there by some of the older slaves. Shrouded ghosts, riding on great black horses, had been seen to enter; balls of fire had been seen to fly there at midnight, and horrid sounds had been repeatedly heard. Slaves know enough of the rudiments of theology to believe that those go to hell who die slaveholders; and they often fancy such persons wishing themselves back again, to wield the lash. Tales of sights and sounds, strange and terrible, connected with the huge black tombs, were a very great security to the grounds about them, for few of the slaves felt like approaching them even in the day time. It was a dark, gloomy and forbidding place, and it was difficult to feel that the spirits of the sleeping dust there deposited, reigned with the blest in the realms of eternal peace.

The business of twenty or thirty farms was transacted at this, called, by way of eminence, "great house farm." These farms all belonged to Col. Lloyd, as did, also, the slaves upon them. Each farm was under the management of an overseer. As I have said of the overseer of the home plantation, so I may say of the overseers on the smaller ones; they stand between the slave and all civil constitutions—their word is law, and is implicitly obeyed.

The colonel, at this time, was reputed to be, and he apparently was, very rich. His slaves, alone, were an immense fortune. These, small and great, could not have been fewer than one thousand in number, and though scarcely a month passed without the sale of one or more lots to the Georgia traders, there was no apparent diminution in the number of his human stock: the home plantation merely groaned at a removal of the young increase, or human crop, then proceeded as lively as ever. Horse-shoeing, cart-mending, plow-repairing, coopering, grinding, and weaving, for all the neighboring farms, were performed here, and slaves were employed in all these branches. "Uncle Tony" was the blacksmith; "Uncle Harry" was the cartwright; "Uncle Abel" was the shoemaker; and all these had hands to assist them in their several departments.

These mechanics were called "uncles" by all the younger slaves, not because they really sustained that relationship to any, but according to plantation _etiquette_, as a mark of respect, due from the younger to the older slaves. Strange, and even ridiculous as it may seem, among a people so uncultivated, and with so many stern trials to look in the face, there is not to be found, among any

people, a more rigid enforcement of the law of respect to elders, than they maintain. I set this down as partly constitutional with my race, and partly conventional. There is no better material in the world for making a gentleman, than is furnished in the African. He shows to others, and exacts for himself, all the tokens of respect which he is compelled to manifest toward his master. A young slave must approach the company of the older with hat in hand, and woe betide him, if he fails to acknowledge a favor, of any sort, with the accustomed _"tank'ee,"_ &c. So uniformly are good manners enforced among slaves, I can easily detect a "bogus" fugitive by his manners.

Among other slave notabilities of the plantation, was one called by everybody Uncle Isaac Copper. It is seldom that a slave gets a surname from anybody in Maryland; and so completely has the south shaped the manners of the north, in this respect, that even abolitionists make very little of the surname of a Negro. The only improvement on the "Bills," "Jacks," "Jims," and "Neds" of the south, observable here is, that "William," "John," "James," "Edward," are substituted. It goes against the grain to treat and address a Negro precisely as they would treat and address a white man. But, once in a while, in slavery as in the free states, by some extraordinary circumstance, the Negro has a surname fastened to him, and holds it against all conventionalities. This was the case with Uncle Isaac Copper. When the "uncle" was dropped, he generally had the prefix "doctor," in its stead. He was our doctor of medicine, and doctor of divinity as well. Where he took his degree I am unable to say, for he was not very communicative to inferiors, and I was emphatically such, being but a boy seven or eight years old. He was too well established in his profession to permit questions as to his native skill, or his attainments. One qualification he undoubtedly had—he was a confirmed _cripple;_ and he could neither work, nor would he bring anything if offered for sale in the market. The old man, though lame, was no sluggard. He was a man that made his crutches do him good service. He was always on the alert, looking up the sick, and all such as were supposed to need his counsel. His remedial prescriptions embraced four articles. For diseases of the body, _Epsom salts and castor oil;_ for those of the soul, _the Lord's Prayer_, and _hickory switches_!

I was not long at Col. Lloyd's before I was placed under the care of Doctor Issac Copper. I was sent to him with twenty or thirty other children, to learn the "Lord's Prayer." I found the old gentleman seated on a huge three-legged oaken stool, armed with several large hickory switches; and, from his position, he could reach—lame as he was—any boy in the room. After standing awhile to learn what was expected of us, the old gentleman, in any other than a devotional tone, commanded us to kneel down. This done, he commenced telling us to say everything he said. "Our Father"—this was repeated after him with promptness and uniformity; "Who art in heaven"—was less promptly and uniformly repeated; and the old gentleman paused in the prayer, to give us a short lecture upon the consequences of inattention, both immediate and future, and especially those more immediate. About these he was absolutely certain, for he held in his right hand the means of bringing all his predictions and warnings to pass. On he proceeded with the prayer; and we with our thick tongues and unskilled ears, followed him to the best of our ability. This, however, was not sufficient to please the old gentleman. Everybody, in the south, wants the privilege of whipping somebody else. Uncle Isaac shared the common passion of his country, and, therefore, seldom found any means of keeping his disciples in order short of flogging. "Say everything I say;" and bang would come the switch on some poor boy's undevotional head. _"What you looking at there"—"Stop that pushing"_—and down again would come the lash.

The whip is all in all. It is supposed to secure obedience to the slaveholder, and is held as a sovereign remedy among the slaves themselves, for every form of disobedience, temporal or spiritual. Slaves, as well as slaveholders, use it with an unsparing hand. Our devotions at Uncle Isaac's combined too much of the tragic and comic, to make them very salutary in a spiritual point of view; and it is due to truth to say, I was often a truant when the time for attending the praying and flogging of Doctor Isaac Copper came on.

The windmill under the care of Mr. Kinney, a kind hearted old Englishman, was to me a source of infinite interest and pleasure. The old man always seemed pleased when he saw a troop of darkey little urchins, with their tow-linen shirts fluttering in the breeze, approaching to view and admire the whirling wings of his wondrous machine. From the mill we could see other objects of deep interest. These were, the vessels from St. Michael's, on their way to Baltimore. It was a source of much amusement to view the flowing sails and complicated rigging, as the little crafts dashed by, and to speculate upon Baltimore, as to the kind and quality of the place. With so many sources of interest around me, the reader may be prepared to learn that I began to think very highly of Col. L.'s plantation. It was just a place to my boyish taste. There were fish to be caught in the creek, if one only had a hook and line; and crabs, clams and oysters were to be caught by wading, digging and raking for them. Here was a field for industry and enterprise, strongly inviting; and the reader may be assured that I entered upon it with spirit.

Even the much dreaded old master, whose merciless fiat had brought me from Tuckahoe, gradually, to my mind, parted with his terrors. Strange enough, his reverence seemed to take no particular notice of me, nor of my coming. Instead of leaping out and

devouring me, he scarcely seemed conscious of my presence. The fact is, he was occupied with matters more weighty and important than either looking after or vexing me. He probably thought as little of my advent, as he would have thought of the addition of a single pig to his stock!

As the chief butler on Col. Lloyd's plantation, his duties were numerous and perplexing. In almost all important matters he answered in Col. Lloyd's stead. The overseers of all the farms were in some sort under him, and received the law from his mouth. The colonel himself seldom addressed an overseer, or allowed an overseer to address him. Old master carried the keys of all store houses; measured out the allowance for each slave at the end of every month; superintended the storing of all goods brought to the plantation; dealt out the raw material to all the handicraftsmen; shipped the grain, tobacco, and all saleable produce of the plantation to market, and had the general oversight of the coopers' shop, wheelwrights' shop, blacksmiths' shop, and shoemakers' shop. Besides the care of these, he often had business for the plantation which required him to be absent two and three days.

Thus largely employed, he had little time, and perhaps as little disposition, to interfere with the children individually. What he was to Col. Lloyd, he made Aunt Katy to him. When he had anything to say or do about us, it was said or done in a wholesale manner; disposing of us in classes or sizes, leaving all minor details to Aunt Katy, a person of whom the reader has already received no very favorable impression. Aunt Katy was a woman who never allowed herself to act greatly within the margin of power granted to her, no matter how broad that authority might be. Ambitious, ill-tempered and cruel, she found in her present position an ample field for the exercise of her ill-omened qualities. She had a strong hold on old master she was considered a first rate cook, and she really was very industrious. She was, therefore, greatly favored by old master, and as one mark of his favor, she was the only mother who was permitted to retain her children around her. Even to these children she was often fiendish in her brutality. She pursued her son Phil, one day, in my presence, with a huge butcher knife, and dealt a blow with its edge which left a shocking gash on his arm, near the wrist. For this, old master did sharply rebuke her, and threatened that if she ever should do the like again, he would take the skin off her back. Cruel, however, as Aunt Katy was to her own children, at times she was not destitute of maternal feeling, as I often had occasion to know, in the bitter pinches of hunger I had to endure. Differing from the practice of Col. Lloyd, old master, instead of allowing so much for each slave, committed the allowance for all to the care of Aunt Katy, to be divided after cooking it, amongst us. The allowance, consisting of coarse corn-meal, was not very abundant—indeed, it was very slender; and in passing through Aunt Katy's hands, it was made more slender still, for some of us. William, Phil and Jerry were her children, and it is not to accuse her too severely, to allege that she was often guilty of starving myself and the other children, while she was literally cramming her own. Want of food was my chief trouble the first summer at my old master's. Oysters and clams would do very well, with an occasional supply of bread, but they soon failed in the absence of bread. I speak but the simple truth, when I say, I have often been so pinched with hunger, that I have fought with the dog—"Old Nep"—for the smallest crumbs that fell from the kitchen table, and have been glad when I won a single crumb in the combat. Many times have I followed, with eager step, the waiting-girl when she went out to shake the table cloth, to get the crumbs and small bones flung out for the cats. The water, in which meat had been boiled, was as eagerly sought for by me. It was a great thing to get the privilege of dipping a piece of bread in such water; and the skin taken from rusty bacon, was a positive luxury. Nevertheless, I sometimes got full meals and kind words from sympathizing old slaves, who knew my sufferings, and received the comforting assurance that I should be a man some day. "Never mind, honey—better day comin'," was even then a solace, a cheering consolation to me in my troubles. Nor were all the kind words I received from slaves. I had a friend in the parlor, as well, and one to whom I shall be glad to do justice, before I have finished this part of my story.

I was not long at old master's, before I learned that his surname was Anthony, and that he was generally called "Captain Anthony"—a title which he probably acquired by sailing a craft in the Chesapeake Bay. Col. Lloyd's slaves never called Capt. Anthony "old master," but always Capt. Anthony; and _me_ they called "Captain Anthony Fred." There is not, probably, in the whole south, a plantation where the English language is more imperfectly spoken than on Col. Lloyd's. It is a mixture of Guinea and everything else you please. At the time of which I am now writing, there were slaves there who had been brought from the coast of Africa. They never used the "s" in indication of the possessive case. "Cap'n Ant'ney Tom," "Lloyd Bill," "Aunt Rose Harry," means "Captain Anthony's Tom," "Lloyd's Bill," &c. _"Oo you dem long to?"_ means, "Whom do you belong to?" _"Oo dem got any peachy?"_ means, "Have you got any peaches?" I could scarcely understand them when I first went among them, so broken was their speech; and I am persuaded that I could not have been dropped anywhere on the globe, where I could reap less, in the way of knowledge, from my immediate associates, than on this plantation. Even "MAS' DANIEL," by his association with his father's slaves, had measurably adopted their dialect and their ideas, so far as they had ideas to be adopted. The equality of nature is strongly asserted in childhood, and childhood requires children for associates. _Color_ makes no difference with a child. Are you a child with wants, tastes and pursuits common to children, not put on, but natural? then, were you black as ebony you would be

welcome to the child of alabaster whiteness. The law of compensation holds here, as well as elsewhere. Mas' Daniel could not associate with ignorance without sharing its shade; and he could not give his black playmates his company, without giving them his intelligence, as well. Without knowing this, or caring about it, at the time, I, for some cause or other, spent much of my time with Mas' Daniel, in preference to spending it with most of the other boys.

Mas' Daniel was the youngest son of Col. Lloyd; his older brothers were Edward and Murray—both grown up, and fine looking men. Edward was especially esteemed by the children, and by me among the rest; not that he ever said anything to us or for us, which could be called especially kind; it was enough for us, that he never looked nor acted scornfully toward us. There were also three sisters, all married; one to Edward Winder; a second to Edward Nicholson; a third to Mr. Lownes.

The family of old master consisted of two sons, Andrew and Richard; his daughter, Lucretia, and her newly married husband, Capt. Auld. This was the house family. The kitchen family consisted of Aunt Katy, Aunt Esther, and ten or a dozen children, most of them older than myself. Capt. Anthony was not considered a rich slaveholder, but was pretty well off in the world. He owned about thirty _"head"_ of slaves, and three farms in Tuckahoe. The most valuable part of his property was his slaves, of whom he could afford to sell one every year. This crop, therefore, brought him seven or eight hundred dollars a year, besides his yearly salary, and other revenue from his farms.

The idea of rank and station was rigidly maintained on Col. Lloyd's plantation. Our family never visited the great house, and the Lloyds never came to our home. Equal non-intercourse was observed between Capt. Anthony's family and that of Mr. Sevier, the overseer.

Such, kind reader, was the community, and such the place, in which my earliest and most lasting impressions of slavery, and of slave-life, were received; of which impressions you will learn more in the coming chapters of this book.

CHAPTER V. _Gradual Initiation to the Mysteries of Slavery_

GROWING ACQUAINTANCE WITH OLD MASTER—HIS CHARACTER—EVILS OF UNRESTRAINED PASSION—APPARENT TENDERNESS—OLD MASTER A MAN OF TROUBLE—CUSTOM OF MUTTERING TO HIMSELF—NECESSITY OF BEING AWARE OF HIS WORDS—THE SUPPOSED OBTUSENESS OF SLAVE-CHILDREN—BRUTAL OUTRAGE—DRUNKEN OVERSEER—SLAVEHOLDER'S IMPATIENCE—WISDOM OF APPEALING TO SUPERIORS—THE SLAVEHOLDER S WRATH BAD AS THAT OF THE OVERSEER—A BASE AND SELFISH ATTEMPT TO BREAK UP A COURTSHIP—A HARROWING SCENE.

Although my old master—Capt. Anthony—gave me at first, (as the reader will have already seen) very little attention, and although that little was of a remarkably mild and gentle description, a few months only were sufficient to convince me that mildness and gentleness were not the prevailing or governing traits of his character. These excellent qualities were displayed only occasionally. He could, when it suited him, appear to be literally insensible to the claims of humanity, when appealed to by the helpless against an aggressor, and he could himself commit outrages, deep, dark and nameless. Yet he was not by nature worse than other men. Had he been brought up in a free state, surrounded by the just restraints of free society—restraints which are necessary to the freedom of all its members, alike and equally—Capt. Anthony might have been as humane a man, and every way as respectable, as many who now oppose the slave system; certainly as humane and respectable as are members of society generally. The slaveholder, as well as the slave, is the victim of the slave system. A man's character greatly takes its hue and shape from the form and color of things about him. Under the whole heavens there is no relation more unfavorable to the development of honorable character, than that sustained by the slaveholder to the slave. Reason is imprisoned here, and passions run wild. Like the fires of the prairie, once lighted, they are at the mercy of every wind, and must burn, till they have consumed all that is combustible within their remorseless grasp. Capt. Anthony could be kind, and, at times, he even showed an affectionate disposition. Could the reader have seen him gently leading me by the hand—as he sometimes did—patting me on the head, speaking to me in soft, caressing tones and calling me his "little Indian boy," he would have deemed him a kind old man, and really, almost fatherly. But the pleasant moods of a slaveholder are remarkably brittle; they are easily snapped; they neither come often, nor remain long. His temper is subjected to perpetual trials; but, since these trials are never borne patiently, they add nothing to his natural stock of patience.

Old master very early impressed me with the idea that he was an unhappy man. Even to my child's eye, he wore a troubled, and at times, a haggard aspect. His strange movements excited my curiosity, and awakened my compassion. He seldom walked alone without muttering to himself; and he occasionally stormed about, as if defying an army of invisible foes. "He would do this, that, and

the other; he'd be d—d if he did not,"—was the usual form of his threats. Most of his leisure was spent in walking, cursing and gesticulating, like one possessed by a demon. Most evidently, he was a wretched man, at war with his own soul, and with all the world around him. To be overheard by the children, disturbed him very little. He made no more of our presence, than of that of the ducks and geese which he met on the green. He little thought that the little black urchins around him, could see, through those vocal crevices, the very secrets of his heart. Slaveholders ever underrate the intelligence with which they have to grapple. I really understood the old man's mutterings, attitudes and gestures, about as well as he did himself. But slaveholders never encourage that kind of communication, with the slaves, by which they might learn to measure the depths of his knowledge. Ignorance is a high virtue in a human chattel; and as the master studies to keep the slave ignorant, the slave is cunning enough to make the master think he succeeds. The slave fully appreciates the saying, "where ignorance is bliss, 'tis folly to be wise." When old master's gestures were violent, ending with a threatening shake of the head, and a sharp snap of his middle finger and thumb, I deemed it wise to keep at a respectable distance from him; for, at such times, trifling faults stood, in his eyes, as momentous offenses; and, having both the power and the disposition, the victim had only to be near him to catch the punishment, deserved or undeserved.

One of the first circumstances that opened my eyes to the cruelty and wickedness of slavery, and the heartlessness of my old master, was the refusal of the latter to interpose his authority, to protect and shield a young woman, who had been most cruelly abused and beaten by his overseer in Tuckahoe. This overseer—a Mr. Plummer—was a man like most of his class, little better than a human brute; and, in addition to his general profligacy and repulsive coarseness, the creature was a miserable drunkard. He was, probably, employed by my old master, less on account of the excellence of his services, than for the cheap rate at which they could be obtained. He was not fit to have the management of a drove of mules. In a fit of drunken madness, he committed the outrage which brought the young woman in question down to my old master's for protection. This young woman was the daughter of Milly, an own aunt of mine. The poor girl, on arriving at our house, presented a pitiable appearance. She had left in haste, and without preparation; and, probably, without the knowledge of Mr. Plummer. She had traveled twelve miles, bare-footed, bare-necked and bare-headed. Her neck and shoulders were covered with scars, newly made; and not content with marring her neck and shoulders, with the cowhide, the cowardly brute had dealt her a blow on the head with a hickory club, which cut a horrible gash, and left her face literally covered with blood. In this condition, the poor young woman came down, to implore protection at the hands of my old master. I expected to see him boil over with rage at the revolting deed, and to hear him fill the air with curses upon the brutual Plummer; but I was disappointed. He sternly told her, in an angry tone, he "believed she deserved every bit of it," and, if she did not go home instantly, he would himself take the remaining skin from her neck and back. Thus was the poor girl compelled to return, without redress, and perhaps to receive an additional flogging for daring to appeal to old master against the overseer.

Old master seemed furious at the thought of being troubled by such complaints. I did not, at that time, understand the philosophy of his treatment of my cousin. It was stern, unnatural, violent. Had the man no bowels of compassion? Was he dead to all sense of humanity? No. I think I now understand it. This treatment is a part of the system, rather than a part of the man. Were slaveholders to listen to complaints of this sort against the overseers, the luxury of owning large numbers of slaves, would be impossible. It would do away with the office of overseer, entirely; or, in other words, it would convert the master himself into an overseer. It would occasion great loss of time and labor, leaving the overseer in fetters, and without the necessary power to secure obedience to his orders. A privilege so dangerous as that of appeal, is, therefore, strictly prohibited; and any one exercising it, runs a fearful hazard. Nevertheless, when a slave has nerve enough to exercise it, and boldly approaches his master, with a well-founded complaint against an overseer, though he may be repulsed, and may even have that of which he complains repeated at the time, and, though he may be beaten by his master, as well as by the overseer, for his temerity, in the end the policy of complaining is, generally, vindicated by the relaxed rigor of the overseer's treatment. The latter becomes more careful, and less disposed to use the lash upon such slaves thereafter. It is with this final result in view, rather than with any expectation of immediate good, that the outraged slave is induced to meet his master with a complaint. The overseer very naturally dislikes to have the ear of the master disturbed by complaints; and, either upon this consideration, or upon advice and warning privately given him by his employers, he generally modifies the rigor of his rule, after an outbreak of the kind to which I have been referring.

Howsoever the slaveholder may allow himself to act toward his slave, and, whatever cruelty he may deem it wise, for example's sake, or for the gratification of his humor, to inflict, he cannot, in the absence of all provocation, look with pleasure upon the bleeding wounds of a defenseless slave-woman. When he drives her from his presence without redress, or the hope of redress, he acts, generally, from motives of policy, rather than from a hardened nature, or from innate brutality. Yet, let but his own temper be stirred, his own passions get loose, and the slave-owner will go _far beyond_ the overseer in cruelty. He will convince the slave that his wrath is far more terrible and boundless, and vastly more to be dreaded, than that of the underling overseer. What may have been mechanically and heartlessly done by the overseer, is now done with a will. The man who now wields the lash is

irresponsible. He may, if he pleases, cripple or kill, without fear of consequences; except in so far as it may concern profit or loss. To a man of violent temper—as my old master was—this was but a very slender and inefficient restraint. I have seen him in a tempest of passion, such as I have just described—a passion into which entered all the bitter ingredients of pride, hatred, envy, jealousy, and the thrist(sic) for revenge.

The circumstances which I am about to narrate, and which gave rise to this fearful tempest of passion, are not singular nor isolated in slave life, but are common in every slaveholding community in which I have lived. They are incidental to the relation of master and slave, and exist in all sections of slave-holding countries.

The reader will have noticed that, in enumerating the names of the slaves who lived with my old master, _Esther_ is mentioned. This was a young woman who possessed that which is ever a curse to the slave-girl; namely—personal beauty. She was tall, well formed, and made a fine appearance. The daughters of Col. Lloyd could scarcely surpass her in personal charms. Esther was courted by Ned Roberts, and he was as fine looking a young man, as she was a woman. He was the son of a favorite slave of Col. Lloyd. Some slaveholders would have been glad to promote the marriage of two such persons; but, for some reason or other, my old master took it upon him to break up the growing intimacy between Esther and Edward. He strictly ordered her to quit the company of said Roberts, telling her that he would punish her severely if he ever found her again in Edward's company. This unnatural and heartless order was, of course, broken. A woman's love is not to be annihilated by the peremptory command of any one, whose breath is in his nostrils. It was impossible to keep Edward and Esther apart. Meet they would, and meet they did. Had old master been a man of honor and purity, his motives, in this matter, might have been viewed more favorably. As it was, his motives were as abhorrent, as his methods were foolish and contemptible. It was too evident that he was not concerned for the girl's welfare. It is one of the damning characteristics of the slave system, that it robs its victims of every earthly incentive to a holy life. The fear of God, and the hope of heaven, are found sufficient to sustain many slave-women, amidst the snares and dangers of their strange lot; but, this side of God and heaven, a slave-woman is at the mercy of the power, caprice and passion of her owner. Slavery provides no means for the honorable continuance of the race. Marriage as imposing obligations on the parties to it—has no existence here, except in such hearts as are purer and higher than the standard morality around them. It is one of the consolations of my life, that I know of many honorable instances of persons who maintained their honor, where all around was corrupt.

Esther was evidently much attached to Edward, and abhorred—as she had reason to do—the tyrannical and base behavior of old master. Edward was young, and fine looking, and he loved and courted her. He might have been her husband, in the high sense just alluded to; but WHO and _what_ was this old master? His attentions were plainly brutal and selfish, and it was as natural that Esther should loathe him, as that she should love Edward. Abhorred and circumvented as he was, old master, having the power, very easily took revenge. I happened to see this exhibition of his rage and cruelty toward Esther. The time selected was singular. It was early in the morning, when all besides was still, and before any of the family, in the house or kitchen, had left their beds. I saw but few of the shocking preliminaries, for the cruel work had begun before I awoke. I was probably awakened by the shrieks and piteous cries of poor Esther. My sleeping place was on the floor of a little, rough closet, which opened into the kitchen; and through the cracks of its unplaned boards, I could distinctly see and hear what was going on, without being seen by old master. Esther's wrists were firmly tied, and the twisted rope was fastened to a strong staple in a heavy wooden joist above, near the fireplace. Here she stood, on a bench, her arms tightly drawn over her breast. Her back and shoulders were bare to the waist. Behind her stood old master, with cowskin in hand, preparing his barbarous work with all manner of harsh, coarse, and tantalizing epithets. The screams of his victim were most piercing. He was cruelly deliberate, and protracted the torture, as one who was delighted with the scene. Again and again he drew the hateful whip through his hand, adjusting it with a view of dealing the most pain-giving blow. Poor Esther had never yet been severely whipped, and her shoulders were plump and tender. Each blow, vigorously laid on, brought screams as well as blood. _"Have mercy; Oh! have mercy"_ she cried; "_I won't do so no more;"_ but her piercing cries seemed only to increase his fury. His answers to them are too coarse and blasphemous to be produced here. The whole scene, with all its attendants, was revolting and shocking, to the last degree; and when the motives of this brutal castigation are considered,—language has no power to convey a just sense of its awful criminality. After laying on some thirty or forty stripes, old master untied his suffering victim, and let her get down. She could scarcely stand, when untied. From my heart I pitied her, and—child though I was—the outrage kindled in me a feeling far from peaceful; but I was hushed, terrified, stunned, and could do nothing, and the fate of Esther might be mine next. The scene here described was often repeated in the case of poor Esther, and her life, as I knew it, was one of wretchedness.

CHAPTER VI. _Treatment of Slaves on Lloyd's Plantation_

EARLY REFLECTIONS ON SLAVERY—PRESENTIMENT OF ONE DAY BEING A FREEMAN—COMBAT BETWEEN AN OVERSEER AND A SLAVEWOMAN—THE ADVANTAGES OF RESISTANCE—ALLOWANCE DAY ON THE HOME PLANTATION—THE SINGING OF SLAVES—AN EXPLANATION—THE SLAVES FOOD AND CLOTHING—NAKED CHILDREN—LIFE IN THE QUARTER—DEPRIVATION OF SLEEP—NURSING CHILDREN CARRIED TO THE FIELD—DESCRIPTION OF THE COWSKIN—THE ASH-CAKE—MANNER OF MAKING IT—THE DINNER HOUR—THE CONTRAST.

The heart-rending incidents, related in the foregoing chapter, led me, thus early, to inquire into the nature and history of slavery. _Why am I a slave? Why are some people slaves, and others masters? Was there ever a time this was not so? How did the relation commence?_ These were the perplexing questions which began now to claim my thoughts, and to exercise the weak powers of my mind, for I was still but a child, and knew less than children of the same age in the free states. As my questions concerning these things were only put to children a little older, and little better informed than myself, I was not rapid in reaching a solid footing. By some means I learned from these inquiries that _"God, up in the sky,"_ made every body; and that he made _white_ people to be masters and mistresses, and _black_ people to be slaves. This did not satisfy me, nor lessen my interest in the subject. I was told, too, that God was good, and that He knew what was best for me, and best for everybody. This was less satisfactory than the first statement; because it came, point blank, against all my notions of goodness. It was not good to let old master cut the flesh off Esther, and make her cry so. Besides, how did people know that God made black people to be slaves? Did they go up in the sky and learn it? or, did He come down and tell them so? All was dark here. It was some relief to my hard notions of the goodness of God, that, although he made white men to be slaveholders, he did not make them to be _bad_ slaveholders, and that, in due time, he would punish the bad slaveholders; that he would, when they died, send them to the bad place, where they would be "burnt up." Nevertheless, I could not reconcile the relation of slavery with my crude notions of goodness.

Then, too, I found that there were puzzling exceptions to this theory of slavery on both sides, and in the middle. I knew of blacks who were _not_ slaves; I knew of whites who were _not_ slaveholders; and I knew of persons who were _nearly_ white, who were slaves. _Color_, therefore, was a very unsatisfactory basis for slavery.

Once, however, engaged in the inquiry, I was not very long in finding out the true solution of the matter. It was not _color_, but _crime_, not _God_, but _man_, that afforded the true explanation of the existence of slavery; nor was I long in finding out another important truth, viz: what man can make, man can unmake. The appalling darkness faded away, and I was master of the subject. There were slaves here, direct from Guinea; and there were many who could say that their fathers and mothers were stolen from Africa—forced from their homes, and compelled to serve as slaves. This, to me, was knowledge; but it was a kind of knowledge which filled me with a burning hatred of slavery, increased my suffering, and left me without the means of breaking away from my bondage. Yet it was knowledge quite worth possessing. I could not have been more than seven or eight years old, when I began to make this subject my study. It was with me in the woods and fields; along the shore of the river, and wherever my boyish wanderings led me; and though I was, at that time, quite ignorant of the existence of the free states, I distinctly remember being, _even then_, most strongly impressed with the idea of being a freeman some day. This cheering assurance was an inborn dream of my human nature a constant menace to slavery—and one which all the powers of slavery were unable to silence or extinguish.

Up to the time of the brutal flogging of my Aunt Esther—for she was my own aunt—and the horrid plight in which I had seen my cousin from Tuckahoe, who had been so badly beaten by the cruel Mr. Plummer, my attention had not been called, especially, to the gross features of slavery. I had, of course, heard of whippings and of savage _rencontres_ between overseers and slaves, but I had always been out of the way at the times and places of their occurrence. My plays and sports, most of the time, took me from the corn and tobacco fields, where the great body of the hands were at work, and where scenes of cruelty were enacted and witnessed. But, after the whipping of Aunt Esther, I saw many cases of the same shocking nature, not only in my master's house, but on Col. Lloyd's plantation. One of the first which I saw, and which greatly agitated me, was the whipping of a woman belonging to Col. Lloyd, named Nelly. The offense alleged against Nelly, was one of the commonest and most indefinite in the whole catalogue of offenses usually laid to the charge of slaves, viz: "impudence." This may mean almost anything, or nothing at all, just according to the caprice of the master or overseer, at the moment. But, whatever it is, or is not, if it gets the name of "impudence," the party charged with it is sure of a flogging. This offense may be committed in various ways; in the tone of an answer; in answering at all; in not answering; in the expression of countenance; in the motion of the head; in the gait, manner and bearing of the slave. In the case under consideration, I can easily believe that, according to all slaveholding standards, here was a genuine instance of impudence. In Nelly there were all the necessary conditions for committing the offense. She was a bright mulatto, the recognized wife of a favorite "hand" on board Col. Lloyd's sloop, and the mother of five sprightly children. She was a vigorous and

spirited woman, and one of the most likely, on the plantation, to be guilty of impudence. My attention was called to the scene, by the noise, curses and screams that proceeded from it; and, on going a little in that direction, I came upon the parties engaged in the skirmish. Mr. Siever, the overseer, had hold of Nelly, when I caught sight of them; he was endeavoring to drag her toward a tree, which endeavor Nelly was sternly resisting; but to no purpose, except to retard the progress of the overseer's plans. Nelly—as I have said—was the mother of five children; three of them were present, and though quite small (from seven to ten years old, I should think) they gallantly came to their mother's defense, and gave the overseer an excellent pelting with stones. One of the little fellows ran up, seized the overseer by the leg and bit him; but the monster was too busily engaged with Nelly, to pay any attention to the assaults of the children. There were numerous bloody marks on Mr. Sevier's face, when I first saw him, and they increased as the struggle went on. The imprints of Nelly's fingers were visible, and I was glad to see them. Amidst the wild screams of the children—"_Let my mammy go"—"let my mammy go_"—there escaped, from between the teeth of the bullet-headed overseer, a few bitter curses, mingled with threats, that "he would teach the d—d b—h how to give a white man impudence." There is no doubt that Nelly felt herself superior, in some respects, to the slaves around her. She was a wife and a mother; her husband was a valued and favorite slave. Besides, he was one of the first hands on board of the sloop, and the sloop hands—since they had to represent the plantation abroad—were generally treated tenderly. The overseer never was allowed to whip Harry; why then should he be allowed to whip Harry's wife? Thoughts of this kind, no doubt, influenced her; but, for whatever reason, she nobly resisted, and, unlike most of the slaves, seemed determined to make her whipping cost Mr. Sevier as much as possible. The blood on his (and her) face, attested her skill, as well as her courage and dexterity in using her nails. Maddened by her resistance, I expected to see Mr. Sevier level her to the ground by a stunning blow; but no; like a savage bull-dog—which he resembled both in temper and appearance—he maintained his grip, and steadily dragged his victim toward the tree, disregarding alike her blows, and the cries of the children for their mother's release. He would, doubtless, have knocked her down with his hickory stick, but that such act might have cost him his place. It is often deemed advisable to knock a _man_ slave down, in order to tie him, but it is considered cowardly and inexcusable, in an overseer, thus to deal with a _woman_. He is expected to tie her up, and to give her what is called, in southern parlance, a "genteel flogging," without any very great outlay of strength or skill. I watched, with palpitating interest, the course of the preliminary struggle, and was saddened by every new advantage gained over her by the ruffian. There were times when she seemed likely to get the better of the brute, but he finally overpowered her, and succeeded in getting his rope around her arms, and in firmly tying her to the tree, at which he had been aiming. This done, and Nelly was at the mercy of his merciless lash; and now, what followed, I have no heart to describe. The cowardly creature made good his every threat; and wielded the lash with all the hot zest of furious revenge. The cries of the woman, while undergoing the terrible infliction, were mingled with those of the children, sounds which I hope the reader may never be called upon to hear. When Nelly was untied, her back was covered with blood. The red stripes were all over her shoulders. She was whipped—severely whipped; but she was not subdued, for she continued to denounce the overseer, and to call him every vile name. He had bruised her flesh, but had left her invincible spirit undaunted. Such floggings are seldom repeated by the same overseer. They prefer to whip those who are most easily whipped. The old doctrine that submission is the very best cure for outrage and wrong, does not hold good on the slave plantation. He is whipped oftenest, who is whipped easiest; and that slave who has the courage to stand up for himself against the overseer, although he may have many hard stripes at the first, becomes, in the end, a freeman, even though he sustain the formal relation of a slave. "You can shoot me but you can't whip me," said a slave to Rigby Hopkins; and the result was that he was neither whipped nor shot. If the latter had been his fate, it would have been less deplorable than the living and lingering death to which cowardly and slavish souls are subjected. I do not know that Mr. Sevier ever undertook to whip Nelly again. He probably never did, for it was not long after his attempt to subdue her, that he was taken sick, and died. The wretched man died as he had lived, unrepentant; and it was said—with how much truth I know not—that in the very last hours of his life, his ruling passion showed itself, and that when wrestling with death, he was uttering horrid oaths, and flourishing the cowskin, as though he was tearing the flesh off some helpless slave. One thing is certain, that when he was in health, it was enough to chill the blood, and to stiffen the hair of an ordinary man, to hear Mr. Sevier talk. Nature, or his cruel habits, had given to his face an expression of unusual savageness, even for a slave-driver. Tobacco and rage had worn his teeth short, and nearly every sentence that escaped their compressed grating, was commenced or concluded with some outburst of profanity. His presence made the field alike the field of blood, and of blasphemy. Hated for his cruelty, despised for his cowardice, his death was deplored by no one outside his own house—if indeed it was deplored there; it was regarded by the slaves as a merciful interposition of Providence. Never went there a man to the grave loaded with heavier curses. Mr. Sevier's place was promptly taken by a Mr. Hopkins, and the change was quite a relief, he being a very different man. He was, in all respects, a better man than his predecessor; as good as any man can be, and yet be an overseer. His course was characterized by no extraordinary cruelty; and when he whipped a slave, as he sometimes did, he seemed to take no especial pleasure in it, but, on the contrary, acted as though he felt it to be a mean business. Mr. Hopkins stayed but a short time; his place

much to the regret of the slaves generally—was taken by a Mr. Gore, of whom more will be said hereafter. It is enough, for the present, to say, that he was no improvement on Mr. Sevier, except that he was less noisy and less profane.

I have already referred to the business-like aspect of Col. Lloyd's plantation. This business-like appearance was much increased on the two days at the end of each month, when the slaves from the different farms came to get their monthly allowance of meal and meat. These were gala days for the slaves, and there was much rivalry among them as to _who_ should be elected to go up to the great house farm for the allowance, and, indeed, to attend to any business at this (for them) the capital. The beauty and grandeur of the place, its numerous slave population, and the fact that Harry, Peter and Jake the sailors of the sloop—almost always kept, privately, little trinkets which they bought at Baltimore, to sell, made it a privilege to come to the great house farm. Being selected, too, for this office, was deemed a high honor. It was taken as a proof of confidence and favor; but, probably, the chief motive of the competitors for the place, was, a desire to break the dull monotony of the field, and to get beyond the overseer's eye and lash. Once on the road with an ox team, and seated on the tongue of his cart, with no overseer to look after him, the slave was comparatively free; and, if thoughtful, he had time to think. Slaves are generally expected to sing as well as to work. A silent slave is not liked by masters or overseers. _"Make a noise," "make a noise,"_ and _"bear a hand,"_ are the words usually addressed to the slaves when there is silence amongst them. This may account for the almost constant singing heard in the southern states. There was, generally, more or less singing among the teamsters, as it was one means of letting the overseer know where they were, and that they were moving on with the work. But, on allowance day, those who visited the great house farm were peculiarly excited and noisy. While on their way, they would make the dense old woods, for miles around, reverberate with their wild notes. These were not always merry because they were wild. On the contrary, they were mostly of a plaintive cast, and told a tale of grief and sorrow. In the most boisterous outbursts of rapturous sentiment, there was ever a tinge of deep melancholy. I have never heard any songs like those anywhere since I left slavery, except when in Ireland. There I heard the same _wailing notes_, and was much affected by them. It was during the famine of 1845-6. In all the songs of the slaves, there was ever some expression in praise of the great house farm; something which would flatter the pride of the owner, and, possibly, draw a favorable glance from him.

I am going away to the great house farm, O yea! O yea! O yea! My old master is a good old master, O yea! O yea! O yea!

This they would sing, with other words of their own improvising—jargon to others, but full of meaning to themselves. I have sometimes thought, that the mere hearing of those songs would do more to impress truly spiritual-minded men and women with the soul-crushing and death-dealing character of slavery, than the reading of whole volumes of its mere physical cruelties. They speak to the heart and to the soul of the thoughtful. I cannot better express my sense of them now, than ten years ago, when, in sketching my life, I thus spoke of this feature of my plantation experience:

I did not, when a slave, understand the deep meanings of those rude, and apparently incoherent songs. I was myself within the circle, so that I neither saw or heard as those without might see and hear. They told a tale which was then altogether beyond my feeble comprehension; they were tones, loud, long and deep, breathing the prayer and complaint of souls boiling over with the bitterest anguish. Every tone was a testimony against slavery, and a prayer to God for deliverance from chains. The hearing of those wild notes always depressed my spirits, and filled my heart with ineffable sadness. The mere recurrence, even now, afflicts my spirit, and while I am writing these lines, my tears are falling. To those songs I trace my first glimmering conceptions of the dehumanizing character of slavery. I can never get rid of that conception. Those songs still follow me, to deepen my hatred of slavery, and quicken my sympathies for my brethren in bonds. If any one wishes to be impressed with a sense of the soul-killing power of slavery, let him go to Col. Lloyd's plantation, and, on allowance day, place himself in the deep, pine woods, and there let him, in silence, thoughtfully analyze the sounds that shall pass through the chambers of his soul, and if he is not thus impressed, it will only be because "there is no flesh in his obdurate heart."

The remark is not unfrequently made, that slaves are the most contended and happy laborers in the world. They dance and sing, and make all manner of joyful noises—so they do; but it is a great mistake to suppose them happy because they sing. The songs of the slave represent the sorrows, rather than the joys, of his heart; and he is relieved by them, only as an aching heart is relieved by its tears. Such is the constitution of the human mind, that, when pressed to extremes, it often avails itself of the most opposite methods. Extremes meet in mind as in matter. When the slaves on board of the "Pearl" were overtaken, arrested, and carried to prison—their hopes for freedom blasted—as they marched in chains they sang, and found (as Emily Edmunson tells us) a melancholy relief in singing. The singing of a man cast away on a desolate island, might be as appropriately considered an evidence of his contentment and happiness, as the singing of a slave. Sorrow and desolation have their songs, as well as joy and peace. Slaves sing more to _make_ themselves happy, than to express their happiness.

It is the boast of slaveholders, that their slaves enjoy more of the physical comforts of life than the peasantry of any country in the world. My experience contradicts this. The men and the women slaves on Col. Lloyd's farm, received, as their monthly allowance of food, eight pounds of pickled pork, or their equivalent in fish. The pork was often tainted, and the fish was of the poorest quality—herrings, which would bring very little if offered for sale in any northern market. With their pork or fish, they had one bushel of Indian meal—unbolted—of which quite fifteen per cent was fit only to feed pigs. With this, one pint of salt was given; and this was the entire monthly allowance of a full grown slave, working constantly in the open field, from morning until night, every day in the month except Sunday, and living on a fraction more than a quarter of a pound of meat per day, and less than a peck of corn-meal per week. There is no kind of work that a man can do which requires a better supply of food to prevent physical exhaustion, than the field-work of a slave. So much for the slave's allowance of food; now for his raiment. The yearly allowance of clothing for the slaves on this plantation, consisted of two tow-linen shirts—such linen as the coarsest crash towels are made of; one pair of trowsers of the same material, for summer, and a pair of trowsers and a jacket of woolen, most slazily put together, for winter; one pair of yarn stockings, and one pair of shoes of the coarsest description. The slave's entire apparel could not have cost more than eight dollars per year. The allowance of food and clothing for the little children, was committed to their mothers, or to the older slavewomen having the care of them. Children who were unable to work in the field, had neither shoes, stockings, jackets nor trowsers given them. Their clothing consisted of two coarse tow-linen shirts—already described—per year; and when these failed them, as they often did, they went naked until the next allowance day. Flocks of little children from five to ten years old, might be seen on Col. Lloyd's plantation, as destitute of clothing as any little heathen on the west coast of Africa; and this, not merely during the summer months, but during the frosty weather of March. The little girls were no better off than the boys; all were nearly in a state of nudity.

As to beds to sleep on, they were known to none of the field hands; nothing but a coarse blanket—not so good as those used in the north to cover horses—was given them, and this only to the men and women. The children stuck themselves in holes and corners, about the quarters; often in the corner of the huge chimneys, with their feet in the ashes to keep them warm. The want of beds, however, was not considered a very great privation. Time to sleep was of far greater importance, for, when the day's work is done, most of the slaves have their washing, mending and cooking to do; and, having few or none of the ordinary facilities for doing such things, very many of their sleeping hours are consumed in necessary preparations for the duties of the coming day.

The sleeping apartments—if they may be called such—have little regard to comfort or decency. Old and young, male and female, married and single, drop down upon the common clay floor, each covering up with his or her blanket,—the only protection they have from cold or exposure. The night, however, is shortened at both ends. The slaves work often as long as they can see, and are late in cooking and mending for the coming day; and, at the first gray streak of morning, they are summoned to the field by the driver's horn.

More slaves are whipped for oversleeping than for any other fault. Neither age nor sex finds any favor. The overseer stands at the quarter door, armed with stick and cowskin, ready to whip any who may be a few minutes behind time. When the horn is blown, there is a rush for the door, and the hindermost one is sure to get a blow from the overseer. Young mothers who worked in the field, were allowed an hour, about ten o'clock in the morning, to go home to nurse their children. Sometimes they were compelled to take their children with them, and to leave them in the corner of the fences, to prevent loss of time in nursing them. The overseer generally rides about the field on horseback. A cowskin and a hickory stick are his constant companions. The cowskin is a kind of whip seldom seen in the northern states. It is made entirely of untanned, but dried, ox hide, and is about as hard as a piece of well-seasoned live oak. It is made of various sizes, but the usual length is about three feet. The part held in the hand is nearly an inch in thickness; and, from the extreme end of the butt or handle, the cowskin tapers its whole length to a point. This makes it quite elastic and springy. A blow with it, on the hardest back, will gash the flesh, and make the blood start. Cowskins are painted red, blue and green, and are the favorite slave whip. I think this whip worse than the "cat-o'nine-tails." It condenses the whole strength of the arm to a single point, and comes with a spring that makes the air whistle. It is a terrible instrument, and is so handy, that the overseer can always have it on his person, and ready for use. The temptation to use it is ever strong; and an overseer can, if disposed, always have cause for using it. With him, it is literally a word and a blow, and, in most cases, the blow comes first.

As a general rule, slaves do not come to the quarters for either breakfast or dinner, but take their "ash cake" with them, and eat it in the field. This was so on the home plantation; probably, because the distance from the quarter to the field, was sometimes two, and even three miles.

The dinner of the slaves consisted of a huge piece of ash cake, and a small piece of pork, or two salt herrings. Not having ovens, nor any suitable cooking utensils, the slaves mixed their meal with a little water, to such thickness that a spoon would stand erect in

it; and, after the wood had burned away to coals and ashes, they would place the dough between oak leaves and lay it carefully in the ashes, completely covering it; hence, the bread is called ash cake. The surface of this peculiar bread is covered with ashes, to the depth of a sixteenth part of an inch, and the ashes, certainly, do not make it very grateful to the teeth, nor render it very palatable. The bran, or coarse part of the meal, is baked with the fine, and bright scales run through the bread. This bread, with its ashes and bran, would disgust and choke a northern man, but it is quite liked by the slaves. They eat it with avidity, and are more concerned about the quantity than about the quality. They are far too scantily provided for, and are worked too steadily, to be much concerned for the quality of their food. The few minutes allowed them at dinner time, after partaking of their coarse repast, are variously spent. Some lie down on the “turning row,” and go to sleep; others draw together, and talk; and others are at work with needle and thread, mending their tattered garments. Sometimes you may hear a wild, hoarse laugh arise from a circle, and often a song. Soon, however, the overseer comes dashing through the field. _“Tumble up! Tumble up_, and to _work, work,”_ is the cry; and, now, from twelve o’clock (mid-day) till dark, the human cattle are in motion, wielding their clumsy hoes; hurried on by no hope of reward, no sense of gratitude, no love of children, no prospect of bettering their condition; nothing, save the dread and terror of the slave-driver’s lash. So goes one day, and so comes and goes another.

But, let us now leave the rough usage of the field, where vulgar coarseness and brutal cruelty spread themselves and flourish, rank as weeds in the tropics; where a vile wretch, in the shape of a man, rides, walks, or struts about, dealing blows, and leaving gashes on broken-spirited men and helpless women, for thirty dollars per month—a business so horrible, hardening and disgraceful, that, rather, than engage in it, a decent man would blow his own brains out—and let the reader view with me the equally wicked, but less repulsive aspects of slave life; where pride and pomp roll luxuriously at ease; where the toil of a thousand men supports a single family in easy idleness and sin. This is the great house; it is the home of the LLOYDS! Some idea of its splendor has already been given—and, it is here that we shall find that height of luxury which is the opposite of that depth of poverty and physical wretchedness that we have just now been contemplating. But, there is this difference in the two extremes; viz: that in the case of the slave, the miseries and hardships of his lot are imposed by others, and, in the master’s case, they are imposed by himself. The slave is a subject, subjected by others; the slaveholder is a subject, but he is the author of his own subjection. There is more truth in the saying, that slavery is a greater evil to the master than to the slave, than many, who utter it, suppose. The self-executing laws of eternal justice follow close on the heels of the evil-doer here, as well as elsewhere; making escape from all its penalties impossible. But, let others philosophize; it is my province here to relate and describe; only allowing myself a word or two, occasionally, to assist the reader in the proper understanding of the facts narrated.

CHAPTER VII. _Life in the Great House_

COMFORTS AND LUXURIES—ELABORATE EXPENDITURE—HOUSE SERVANTS—MEN SERVANTS AND MAID SERVANTS—APPEARANCES—SLAVE ARISTOCRACY—STABLE AND CARRIAGE HOUSE—BOUNDLESS HOSPITALITY—FRAGRANCE OF RICH DISHES—THE DECEPTIVE CHARACTER OF SLAVERY—SLAVES SEEM HAPPY—SLAVES AND SLAVEHOLDERS ALIKE WRETCHED—FRETFUL DISCONTENT OF SLAVEHOLDERS—FAULT-FINDING—OLD BARNEY—HIS PROFESSION—WHIPPING—HUMILIATING SPECTACLE—CASE EXCEPTIONAL—WILLIAM WILKS—SUPPOSED SON OF COL. LLOYD—CURIOUS INCIDENT—SLAVES PREFER RICH MASTERS TO POOR ONES.

The close-fisted stinginess that fed the poor slave on coarse corn-meal and tainted meat; that clothed him in crashy tow-linen, and hurried him to toil through the field, in all weathers, with wind and rain beating through his tattered garments; that scarcely gave even the young slave-mother time to nurse her hungry infant in the fence corner; wholly vanishes on approaching the sacred precincts of the great house, the home of the Lloyds. There the scriptural phrase finds an exact illustration; the highly favored inmates of this mansion are literally arrayed “in purple and fine linen,” and fare sumptuously every day! The table groans under the heavy and blood-bought luxuries gathered with painstaking care, at home and abroad. Fields, forests, rivers and seas, are made tributary here. Immense wealth, and its lavish expenditure, fill the great house with all that can please the eye, or tempt the taste. Here, appetite, not food, is the great _desideratum_. Fish, flesh and fowl, are here in profusion. Chickens, of all breeds; ducks, of all kinds, wild and tame, the common, and the huge Muscovite; Guinea fowls, turkeys, geese, and pea fowls, are in their several pens, fat and fatting for the destined vortex. The graceful swan, the mongrels, the black-necked wild goose; partridges, quails, pheasants and pigeons; choice water fowl, with all their strange varieties, are caught in this huge family net. Beef, veal, mutton and venison, of the most select kinds and quality, roll bounteously to this grand consumer. The teeming riches of the Chesapeake bay, its rock, perch, drums, crocus, trout, oysters, crabs, and terrapin, are drawn hither to adorn the glittering table of the great house.

The dairy, too, probably the finest on the Eastern Shore of Maryland—supplied by cattle of the best English stock, imported for the purpose, pours its rich donations of fragant cheese, golden butter, and delicious cream, to heighten the attraction of the gorgeous, unending round of feasting. Nor are the fruits of the earth forgotten or neglected. The fertile garden, many acres in size, constituting a separate establishment, distinct from the common farm—with its scientific gardener, imported from Scotland (a Mr. McDermott) with four men under his direction, was not behind, either in the abundance or in the delicacy of its contributions to the same full board. The tender asparagus, the succulent celery, and the delicate cauliflower; egg plants, beets, lettuce, parsnips, peas, and French beans, early and late; radishes, cantelopes, melons of all kinds; the fruits and flowers of all climes and of all descriptions, from the hardy apple of the north, to the lemon and orange of the south, culminated at this point. Baltimore gathered figs, raisins, almonds and juicy grapes from Spain. Wines and brandies from France; teas of various flavor, from China; and rich, aromatic coffee from Java, all conspired to swell the tide of high life, where pride and indolence rolled and lounged in magnificence and satiety.

Behind the tall-backed and elaborately wrought chairs, stand the servants, men and maidens—fifteen in number—discriminately selected, not only with a view to their industry and faithfulness, but with special regard to their personal appearance, their graceful agility and captivating address. Some of these are armed with fans, and are fanning reviving breezes toward the over-heated brows of the alabaster ladies; others watch with eager eye, and with fawn-like step anticipate and supply wants before they are sufficiently formed to be announced by word or sign.

These servants constituted a sort of black aristocracy on Col. Lloyd's plantation. They resembled the field hands in nothing, except in color, and in this they held the advantage of a velvet-like glossiness, rich and beautiful. The hair, too, showed the same advantage. The delicate colored maid rustled in the scarcely worn silk of her young mistress, while the servant men were equally well attired from the over-flowing wardrobe of their young masters; so that, in dress, as well as in form and feature, in manner and speech, in tastes and habits, the distance between these favored few, and the sorrow and hunger-smitten multitudes of the quarter and the field, was immense; and this is seldom passed over.

Let us now glance at the stables and the carriage house, and we shall find the same evidences of pride and luxurious extravagance. Here are three splendid coaches, soft within and lustrous without. Here, too, are gigs, phaetons, barouches, sulkeys and sleighs. Here are saddles and harnesses—beautifully wrought and silver mounted—kept with every care. In the stable you will find, kept only for pleasure, full thirty-five horses, of the most approved blood for speed and beauty. There are two men here constantly employed in taking care of these horses. One of these men must be always in the stable, to answer every call from the great house. Over the way from the stable, is a house built expressly for the hounds—a pack of twenty-five or thirty—whose fare would have made glad the heart of a dozen slaves. Horses and hounds are not the only consumers of the slave's toil. There was practiced, at the Lloyd's, a hospitality which would have astonished and charmed any health-seeking northern divine or merchant, who might have chanced to share it. Viewed from his own table, and _not_ from the field, the colonel was a model of generous hospitality. His house was, literally, a hotel, for weeks during the summer months. At these times, especially, the air was freighted with the rich fumes of baking, boiling, roasting and broiling. The odors I shared with the winds; but the meats were under a more stringent monopoly except that, occasionally, I got a cake from Mas' Daniel. In Mas' Daniel I had a friend at court, from whom I learned many things which my eager curiosity was excited to know. I always knew when company was expected, and who they were, although I was an outsider, being the property, not of Col. Lloyd, but of a servant of the wealthy colonel. On these occasions, all that pride, taste and money could do, to dazzle and charm, was done.

Who could say that the servants of Col. Lloyd were not well clad and cared for, after witnessing one of his magnificent entertainments? Who could say that they did not seem to glory in being the slaves of such a master? Who, but a fanatic, could get up any sympathy for persons whose every movement was agile, easy and graceful, and who evinced a consciousness of high superiority? And who would ever venture to suspect that Col. Lloyd was subject to the troubles of ordinary mortals? Master and slave seem alike in their glory here? Can it all be seeming? Alas! it may only be a sham at last! This immense wealth; this gilded splendor; this profusion of luxury; this exemption from toil; this life of ease; this sea of plenty; aye, what of it all? Are the pearly gates of happiness and sweet content flung open to such suitors? _far from it!_ The poor slave, on his hard, pine plank, but scantily covered with his thin blanket, sleeps more soundly than the feverish voluptuary who reclines upon his feather bed and downy pillow. Food, to the indolent lounger, is poison, not sustenance. Lurking beneath all their dishes, are invisible spirits of evil, ready to feed the self-deluded gormandizers which aches, pains, fierce temper, uncontrolled passions, dyspepsia, rheumatism, lumbago and gout; and of these the Lloyds got their full share. To the pampered love of ease, there is no resting place. What is pleasant today, is repulsive tomorrow; what is soft now, is hard at another time; what is sweet in the morning, is bitter in the evening. Neither

to the wicked, nor to the idler, is there any solid peace: _“Troubled, like the restless sea.”_

I had excellent opportunities of witnessing the restless discontent and the capricious irritation of the Lloyds. My fondness for horses—not peculiar to me more than to other boys attracted me, much of the time, to the stables. This establishment was especially under the care of “old” and “young” Barney—father and son. Old Barney was a fine looking old man, of a brownish complexion, who was quite portly, and wore a dignified aspect for a slave. He was, evidently, much devoted to his profession, and held his office an honorable one. He was a farrier as well as an ostler; he could bleed, remove lampers from the mouths of the horses, and was well instructed in horse medicines. No one on the farm knew, so well as Old Barney, what to do with a sick horse. But his gifts and acquirements were of little advantage to him. His office was by no means an enviable one. He often got presents, but he got stripes as well; for in nothing was Col. Lloyd more unreasonable and exacting, than in respect to the management of his pleasure horses. Any supposed inattention to these animals were sure to be visited with degrading punishment. His horses and dogs fared better than his men. Their beds must be softer and cleaner than those of his human cattle. No excuse could shield Old Barney, if the colonel only suspected something wrong about his horses; and, consequently, he was often punished when faultless. It was absolutely painful to listen to the many unreasonable and fretful scoldings, poured out at the stable, by Col. Lloyd, his sons and sons-in-law. Of the latter, he had three—Messrs. Nicholson, Winder and Lownes. These all lived at the great house a portion of the year, and enjoyed the luxury of whipping the servants when they pleased, which was by no means unfrequently. A horse was seldom brought out of the stable to which no objection could be raised. “There was dust in his hair;” “there was a twist in his reins;” “his mane did not lie straight;” “he had not been properly grained;” “his head did not look well;” “his fore-top was not combed out;” “his fetlocks had not been properly trimmed;” something was always wrong. Listening to complaints, however groundless, Barney must stand, hat in hand, lips sealed, never answering a word. He must make no reply, no explanation; the judgment of the master must be deemed infallible, for his power is absolute and irresponsible. In a free state, a master, thus complaining without cause, of his ostler, might be told—“Sir, I am sorry I cannot please you, but, since I have done the best I can, your remedy is to dismiss me.” Here, however, the ostler must stand, listen and tremble. One of the most heart-saddening and humiliating scenes I ever witnessed, was the whipping of Old Barney, by Col. Lloyd himself. Here were two men, both advanced in years; there were the silvery locks of Col. L., and there was the bald and toil-worn brow of Old Barney; master and slave; superior and inferior here, but _equals_ at the bar of God; and, in the common course of events, they must both soon meet in another world, in a world where all distinctions, except those based on obedience and disobedience, are blotted out forever. “Uncover your head!” said the imperious master; he was obeyed. “Take off your jacket, you old rascal!” and off came Barney’s jacket. “Down on your knees!” down knelt the old man, his shoulders bare, his bald head glistening in the sun, and his aged knees on the cold, damp ground. In his humble and debasing attitude, the master—that master to whom he had given the best years and the best strength of his life—came forward, and laid on thirty lashes, with his horse whip. The old man bore it patiently, to the last, answering each blow with a slight shrug of the shoulders, and a groan. I cannot think that Col. Lloyd succeeded in marring the flesh of Old Barney very seriously, for the whip was a light, riding whip; but the spectacle of an aged man—a husband and a father—humbly kneeling before a worm of the dust, surprised and shocked me at the time; and since I have grown old enough to think on the wickedness of slavery, few facts have been of more value to me than this, to which I was a witness. It reveals slavery in its true color, and in its maturity of repulsive hatefulness. I owe it to truth, however, to say, that this was the first and the last time I ever saw Old Barney, or any other slave, compelled to kneel to receive a whipping.

I saw, at the stable, another incident, which I will relate, as it is illustrative of a phase of slavery to which I have already referred in another connection. Besides two other coachmen, Col. Lloyd owned one named William, who, strangely enough, was often called by his surname, Wilks, by white and colored people on the home plantation. Wilks was a very fine looking man. He was about as white as anybody on the plantation; and in manliness of form, and comeliness of features, he bore a very striking resemblance to Mr. Murray Lloyd. It was whispered, and pretty generally admitted as a fact, that William Wilks was a son of Col. Lloyd, by a highly favored slave-woman, who was still on the plantation. There were many reasons for believing this whisper, not only in William’s appearance, but in the undeniable freedom which he enjoyed over all others, and his apparent consciousness of being something more than a slave to his master. It was notorious, too, that William had a deadly enemy in Murray Lloyd, whom he so much resembled, and that the latter greatly worried his father with importunities to sell William. Indeed, he gave his father no rest until he did sell him, to Austin Woldfolk, the great slave-trader at that time. Before selling him, however, Mr. L. tried what giving William a whipping would do, toward making things smooth; but this was a failure. It was a compromise, and defeated itself; for, immediately after the infliction, the heart-sickened colonel atoned to William for the abuse, by giving him a gold watch and chain. Another fact, somewhat curious, is, that though sold to the remorseless _Woldfolk_, taken in irons to Baltimore and cast into prison, with a view to being driven to the south, William, by _some_ means—always a mystery to me—outbid all his purchasers, paid for himself, _and

now resides in Baltimore, a_ FREEMAN. Is there not room to suspect, that, as the gold watch was presented to atone for the whipping, a purse of gold was given him by the same hand, with which to effect his purchase, as an atonement for the indignity involved in selling his own flesh and blood. All the circumstances of William, on the great house farm, show him to have occupied a different position from the other slaves, and, certainly, there is nothing in the supposed hostility of slaveholders to amalgamation, to forbid the supposition that William Wilks was the son of Edward Lloyd. _Practical_ amalgamation is common in every neighborhood where I have been in slavery.

Col. Lloyd was not in the way of knowing much of the real opinions and feelings of his slaves respecting him. The distance between him and them was far too great to admit of such knowledge. His slaves were so numerous, that he did not know them when he saw them. Nor, indeed, did all his slaves know him. In this respect, he was inconveniently rich. It is reported of him, that, while riding along the road one day, he met a colored man, and addressed him in the usual way of speaking to colored people on the public highways of the south: “Well, boy, who do you belong to?” “To Col. Lloyd,” replied the slave. “Well, does the colonel treat you well?” “No, sir,” was the ready reply. “What? does he work you too hard?” “Yes, sir.” “Well, don’t he give enough to eat?” “Yes, sir, he gives me enough, such as it is.” The colonel, after ascertaining where the slave belonged, rode on; the slave also went on about his business, not dreaming that he had been conversing with his master. He thought, said and heard nothing more of the matter, until two or three weeks afterwards. The poor man was then informed by his overseer, that, for having found fault with his master, he was now to be sold to a Georgia trader. He was immediately chained and handcuffed; and thus, without a moment’s warning he was snatched away, and forever sundered from his family and friends, by a hand more unrelenting than that of death. _This_ is the penalty of telling the simple truth, in answer to a series of plain questions. It is partly in consequence of such facts, that slaves, when inquired of as to their condition and the character of their masters, almost invariably say they are contented, and that their masters are kind. Slaveholders have been known to send spies among their slaves, to ascertain, if possible, their views and feelings in regard to their condition. The frequency of this had the effect to establish among the slaves the maxim, that a still tongue makes a wise head. They suppress the truth rather than take the consequence of telling it, and, in so doing, they prove themselves a part of the human family. If they have anything to say of their master, it is, generally, something in his favor, especially when speaking to strangers. I was frequently asked, while a slave, if I had a kind master, and I do not remember ever to have given a negative reply. Nor did I, when pursuing this course, consider myself as uttering what was utterly false; for I always measured the kindness of my master by the standard of kindness set up by slaveholders around us. However, slaves are like other people, and imbibe similar prejudices. They are apt to think _their condition_ better than that of others. Many, under the influence of this prejudice, think their own masters are better than the masters of other slaves; and this, too, in some cases, when the very reverse is true. Indeed, it is not uncommon for slaves even to fall out and quarrel among themselves about the relative kindness of their masters, contending for the superior goodness of his own over that of others. At the very same time, they mutually execrate their masters, when viewed separately. It was so on our plantation. When Col. Lloyd’s slaves met those of Jacob Jepson, they seldom parted without a quarrel about their masters; Col. Lloyd’s slaves contending that he was the richest, and Mr. Jepson’s slaves that he was the smartest, man of the two. Col. Lloyd’s slaves would boost his ability to buy and sell Jacob Jepson; Mr. Jepson’s slaves would boast his ability to whip Col. Lloyd. These quarrels would almost always end in a fight between the parties; those that beat were supposed to have gained the point at issue. They seemed to think that the greatness of their masters was transferable to themselves. To be a SLAVE, was thought to be bad enough; but to be a _poor man’s_ slave, was deemed a disgrace, indeed.

CHAPTER VIII. _A Chapter of Horrors_

AUSTIN GORE—A SKETCH OF HIS CHARACTER—OVERSEERS AS A CLASS—THEIR PECULIAR CHARACTERISTICS—THE MARKED INDIVIDUALITY OF AUSTIN GORE—HIS SENSE OF DUTY—HOW HE WHIPPED—MURDER OF POOR DENBY—HOW IT OCCURRED—SENSATION—HOW GORE MADE PEACE WITH COL. LLOYD—THE MURDER UNPUNISHED—ANOTHER DREADFUL MURDER NARRATED—NO LAWS FOR THE PROTECTION OF SLAVES CAN BE ENFORCED IN THE SOUTHERN STATES.

As I have already intimated elsewhere, the slaves on Col. Lloyd’s plantation, whose hard lot, under Mr. Sevier, the reader has already noticed and deplored, were not permitted to enjoy the comparatively moderate rule of Mr. Hopkins. The latter was succeeded by a very different man. The name of the new overseer was Austin Gore. Upon this individual I would fix particular attention; for under his rule there was more suffering from violence and bloodshed than had—according to the older slaves ever been experienced before on this plantation. I confess, I hardly know how to bring this man fitly before the reader. He was, it is true, an overseer, and possessed, to a large extent, the peculiar characteristics of his class; yet, to call him merely an overseer, would

not give the reader a fair notion of the man. I speak of overseers as a class. They are such. They are as distinct from the slaveholding gentry of the south, as are the fishwomen of Paris, and the coal-heavers of London, distinct from other members of society. They constitute a separate fraternity at the south, not less marked than is the fraternity of Park Lane bullies in New York. They have been arranged and classified by that great law of attraction, which determines the spheres and affinities of men; which ordains, that men, whose malign and brutal propensities predominate over their moral and intellectual endowments, shall, naturally, fall into those employments which promise the largest gratification to those predominating instincts or propensities. The office of overseer takes this raw material of vulgarity and brutality, and stamps it as a distinct class of southern society. But, in this class, as in all other classes, there are characters of marked individuality, even while they bear a general resemblance to the mass. Mr. Gore was one of those, to whom a general characterization would do no manner of justice. He was an overseer; but he was something more. With the malign and tyrannical qualities of an overseer, he combined something of the lawful master. He had the artfulness and the mean ambition of his class; but he was wholly free from the disgusting swagger and noisy bravado of his fraternity. There was an easy air of independence about him; a calm self-possession, and a sternness of glance, which might well daunt hearts less timid than those of poor slaves, accustomed from childhood and through life to cower before a driver's lash. The home plantation of Col. Lloyd afforded an ample field for the exercise of the qualifications for overseership, which he possessed in such an eminent degree.
